		X to Exclude Queens.....	10, 35

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

## \$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

- \*A. I. Root, Medina, Ohio.
- \*H. H. Brown, Light Street, Columbia Co., Pa. 101f
- \*Paul L. Viallon, Bayou Goula, La. 11fd
- \*S. F. Newman, Norwalk, Huron Co., O. 11fd
- \*Wm. Ballantine, Sago, Musk. Co., O. 11fd
- \*D. A. McCord, Oxford, Butler Co., O. 3-2
- \*Jas. A. Nelson, box E3, Wyandott, Wy. Co., Kan. 5-5

## Hive Manufacturers.

Who agree to make such hives, and at the prices named, as those described on our circular.

- A. I. Root, Medina, Ohio.
- P. L. Viallon, Bayou Goula, Iberville Par., La. 11fd
- S. F. Newman, Norwalk, Huron Co., O. 11fd
- F. A. Snell, Milledgeville, Carroll Co., Ill. 3-2
- M. S. West, Flint, Gen. Co., Mich. 1-6

## BEE-KEEPERS, ATTENTION!!

200 COLONIES OF BEES FOR SALE.

All interested in advanced bee culture, who want to make bee-keeping pay, should send for price list of Apianian Supplies, Bees, Queens, etc., to

**E. T. FLANAGAN,**

Box 819, Belleville, St. Clair Co., Illinois.

Proprietor of Rose Hill, Cahokia, Falling Springs, and Lake Apiaries.—Beeswax wanted. 1-12d

## FOR SALE!

50 STRONG COLONIES, Italian and hybrid bees, in two-story Simplicity hives. STACY PETTIT, 1-3d Ft. Smith, Sebastian Co., Ark.

**E. T. LEWIS & CO., TOLEDO, OHIO,** Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianian Supplies. Send for circular. 11fd

## IMPORTED QUEENS.

In April, - - - - - 11 francs in Gold.  
 May and June, - - - - - 10 " " "  
 July and August, - - - - - 9 " " "  
 September and August, - - - - - 7 " " "

No orders received for less than 8 queens. Queens which die in transit will be replaced only if sent back in a letter. 1-6d

**CHARLES BIANCONCINI & CO., Bologna, Italy.**

**B**EEES AND QUEENS FROM MY APIARIES. 3fd  
**QUEENS AND NUCLEI IN SEASON.**  
 Circular on application.

J. H. ROBERTSON, PEWAMO, IONIA CO., MICH.

## 1883-1883 ITALIAN QUEENS.

I am now booking orders for queens. I cull my queens as they hatch, is the reason my customers were so well pleased last year. Send me your address on postal, and get circular. Six for \$5.00. **J. T. WILSON,** 11fd Mortonsville, Woodford Co., Ky.

## THE MOST PERFECT AND HANDY COMB-HONEY ARRANGEMENT EVER INVENTED.

For \$1.00 I will send you my New Clamp, filled with the most perfect sections in the world. My circular will be ready in January. Send a one-cent stamp for one.

Mr. J. H. Warner, of Central Bridge, Scho. Co., N. Y., writes me as follows: "Mr. F. Boomhower: To work with your clamp is simply a pleasure."

Address **F. BOOMHOWER,** 1d Gallupville, Schoharie Co., N. Y.

## 50 TO 150 COLONIES OF PURE ITALIAN BEES,

In new, superior, well-painted, movable-frame hives (frames 12 1/4 x 12 1/4 in.), for sale at \$6.00 per colony, delivered at depot or express office at Lexington, La Fayette Co., Mo. DR. G. W. YOUNG. 12-2d

**LOOK!** A neat stencil plate, ink and brush for 35 cts. Three to one address for \$1.00 postpaid. Address **JOHN COLTSON,** 1-3d East Rochester, Col. Co., Ohio.

## Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**CLEVELAND.**—*Honey.*—Honey has been a little dull the past two weeks, and prices about 1c. lower. But white, in 1-lb. sections, selling 20 to 21, and 19 to 20 for 2 lbs. Second quality about 2c. less. Extracted is very dull, scarcely any selling, holding at 10 to 11 in bbis, and 12 to 15 in cans and pails. *Beeswax* very scarce, 2 $\frac{1}{2}$ @10. A. C. KENDEL.  
Cleveland, O., Dec. 21, 1882.

**DETROIT.**—*Honey.*—The supply of comb honey is just about equal to the demand. It is bringing from 18@20 cts. for a good article, and from 15@16 cts. for dark; the latter sells but slowly. *Beeswax* is worth 25@30 cts. A. B. WEED.  
Detroit, Mich., Dec. 26, 1882.

**CINCINNATI.**—*Honey.*—The demand is good for extracted honey in barrels, as well as in glass jars and tin buckets. Arrivals fair. The demand is fair for comb honey, which is not cheap enough to make trade lively. Extracted honey brings 7 $\frac{1}{2}$ @0c on arrival; comb honey, 14@20c. CHAS. F. MUTH.  
Cincinnati, O., Dec. 21, 1882.

**CHICAGO.**—*Honey.*—Prices are unchanged, but the supply is more than equal to the demand. *Beeswax* is scarce, and rules at 27c for bright yellow, cash on arrival; dark and off color, 17@22c. ALFRED H. NEWMAN.  
923 West Madison St., Chicago, Ill., Dec. 21, 1882.

I have some pure linn honey for sale, in 30 and 60 lb. tin cans. J. B. MURRAY.  
Ada, Hardin Co., O., Dec. 17, 1882.

I have 1400 lbs. white extracted honey to sell, at 10 cts. per lb., packages included. ROBT. QUINN.  
Shellsburg, Benton Co., Iowa, Dec. 1, 1882.

I will pay 10 cts. per lb. for white clover or linden honey, in barrels or half-barrels, or 8 to 8 $\frac{1}{2}$  for good buckwheat. Send samples before shipping. I. M. KAUFMAN.  
Huntingdon, Pa., Box 290, Dec. 21, 1882.

I have 5000 lbs. of extracted honey, which I will sell at 9 cts., delivered at Cincinnati or St. Louis. Sample sent if required. Barrels thrown in. P. L. VIALLO.  
Bayou Goula, La., Dec. 17, 1882.

[Friend V., if this honey is as good as friend Blanton's, it ought to go quick at the above figures.]

I have 1000 lbs. in 1 $\frac{1}{2}$ -lb. boxes to sell, put up in crates of 16 boxes each; outside boxes glassed, remainder not glassed. Delivered on board the cars at Decatur, Van Buren Co., Mich., at 18c per lb. S. H. MALLORY.

## BE SURE

To send a postal card for our illustrated catalogue of  
**APIARIAN SUPPLIES**

Before purchasing elsewhere. It contains illustrations and descriptions of every thing new and desirable in an apiary,

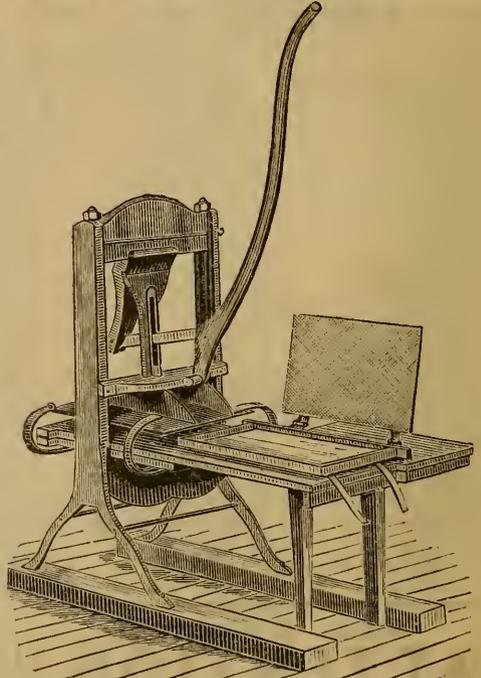

## AT THE LOWEST PRICES.

Italian Queens and Bees.

**J. C. SAYLES,**  
Hartford, Washington Co., Wis.

1-6d

## GIVEN FOUNDATION PRESS —AND— WIRING MACHINE

The improvements in this Press give it a superiority, both for thin and wired foundation. Circular and samples free. Address

**D. S. GIVEN & C.,**  
Hoopston, Vermillion Co., Ill.

1d

**E. T. LEWIS & CO., TOLEDO, OHIO,**  
Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apiarian supplies. Send for circular. Iftd

## FOR SALE CHEAP

One Barnes foot-power circular saw, with scroll-saw attachment, including rip, cross-cut, and dovetailing saw, with 24 saw-blades. Is in perfect condition; has never been used one hour. Manufacturer's price, \$40.00. Will take \$30.00.

Will pay 30c for clean pure yellow beeswax delivered at this station. **EZRA BAER,**  
1d Sterling, Whitesides Co., Ill.

**I WANT TO BUY 100 nuclei** (Lang. frame). Address, giving all the particulars, **1d F. A. SALSBURY,** Geddes, Onondaga Co., N. Y.

## FOR SALE!

A farm of 120 acres cheap; also 70 hives of bees, with or without. For particulars, address  
**1 C. C. HOLMES,** Sauk Rapids, Benton Co., Minn.

## BASSWOODS AT \$1.75 PER 100.

By freight or express; all to be one foot or more. Address **HENRY WIRTH,**  
1-3d Borodino, Onondaga Co., N. Y.

Vol. XI. JAN. 1, 1883. No. 1.

**A. I. ROOT,**  
*Publisher and Proprietor,*  
Medina, O.

Published Monthly.  
*Established in 1873.*

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POST-OFFICE. Clubs to different postoffices, NOT LESS than 90 cts. each.

**NOTES FROM THE BANNER APIARY.**

NO. 38.

HOW 3 COLONIES WERE INCREASED TO 30.

**A** CORRESPONDENT wishes me to tell how I increased 3 colonies to 30. The plan pursued was simply this: As soon as the three colonies were strong in numbers, and the combs full of brood, enough combs with the adhering bees were obtained by taking 3 or 4 from each of the three colonies, to fill a hive. Although taken from different colonies, the bees never quarreled; and after the newly formed colony had remained queenless a day or two, it was given a queen. As soon as the colonies were strong enough, another colony was made in the same manner, and this course was followed the season through, or, rather, until lack of hives put an end to the experiment. As often as a sufficient number of frames of brood could be spared from any of the hives, then a new colony was formed and given a queen. The vacancies caused in the old colonies, by taking frames to form new ones, were always filled with frames of empty comb or fdn. My greatest objection to the above method of increase is, that considerable time must be spent in finding queens before removing frames of brood, when making up new colonies.

A CLAMP FOR WINTERING BEES.

Nov. 18.—I buried 32 colonies in one clamp. The arrangement was as follows: Upon a dry sandy knoll was dug a pit 7 feet wide, 15 long, and about 4 feet deep. The walls were given a slant of about 45°. In order that no water should ever stand in the

pit, a two-inch tile drain was laid from its lowest part. Fence-posts were placed, one foot apart, crosswise of the pit, their ends being imbedded in the sides of the pit until their upper sides were about 18 inches below the surface level. The space underneath the fence-posts was filled with straw, then the hives were placed in a double row, upon the posts. Each row of hives contained 8 hives, making 16 hives in the first two rows, then upon the top of these two rows were placed two more rows of hives. Each of those two upper rows contained 7 hives of a smaller pattern than those in the lower rows. Two of the hives contained two colonies each. Straw was thrown over the hives until a pyramidal-shaped pile was formed, then fence-posts were placed in an upright position, about 8 inches apart, all around the mound of straw inclosing the hives. The lower ends of the posts rested upon the earth; their upper ends leaning against the upper rows of hives. Over the fence-posts was placed another coating of straw about one foot thick, and over this was thrown a covering of earth about 18 inches thick. There were no openings for ventilation.

MEETING PROF. A. J. COOK.

Nov. 25, or thereabouts, I received a card that read something as follows: "Shall be in Flint Dec. 4th and 5th, attending the State Horticultural meeting, and should be glad to meet you there. Ever yours, A. J. Cook." Of course, I was on hand; but friend C. did not arrive until the evening of the 4th, and I had no opportunity of speaking to him until after I had listened to that interesting lecture of his upon the subject of Evolution. As soon as possible after he had ceased speaking, I pressed forward and

grasped his hand; and if ever I received a hearty hand-shake it was from kind-hearted, whole-souled, enthusiastic Prof. Cook. But others gathered around, and they kept gathering around; not only that evening, but the next day; and it was not until friend C. and myself took the train Wednesday morning, and were on our way to Kalamazoo to attend the convention, that we really had an opportunity for a good, long, friendly chat. What did we talk about, do you ask? Oh! lots of things. About

#### DOLLAR QUEENS?

Yes, we talked about dollar queens, and friend C. was surprised to learn that we queen-breeders had regular customers who bought queens by the dozen year after year—the breeder, with his experience, implements, and extensive manner of conducting the business, being enabled to rear queens cheaper than they. He also admitted, that there was probably no difference in quality between the so-called dollar queens and the so-called tested ones; and, with the care given the matter by most of the breeders, he thought that the chances for dollar queens to be impurely mated were small indeed; yet, taken as a whole, he thought that the cheap-queen traffic discouraged breeders from putting forth their best efforts toward an improvement of their bees, and cited the case of friend D. A. Jones as an illustration. He said, that friend Jones had spent large sums of money in importing new strains, or varieties of bees, but had not received an adequate return, because queens of the variety that he had imported were soon offered, all over the country, at one dollar each. Now, the cheap-queen traffic did not prevent friend Jones from selling the first queens that he imported and reared at a good round price; but, of course, as soon as other breeders obtained some of the queens to breed from, they could sell queens of that variety as cheaply as they could Italians. When new and good varieties of vegetables or grain, or imported breeds of stock or poultry, are first introduced they bring very large prices; but as soon as widely disseminated, the prices fall; and with any thing that increases so rapidly as do bees, the fall in prices soon comes. I told friend Cook that I did not think the cheap-queen traffic would hinder a bee-keeper from getting good prices for queens, if he succeeded in developing a really superior strain of bees; but, at the time of our conversation, I could give him no illustration; but now, since attending the convention, I think I can give him one. Many of us know that friend Heddon has taken a new departure, and has demonstrated to his own satisfaction that a cross between the brown German bee and the dark leather-colored Italian is superior to either variety. At the convention he said that, as soon as the good qualities of this cross were made known, he was overwhelmed with orders for queens; that customers would often just roll up a five-dollar bill, send it along, and say: "Send me a queen, the best you can for the money. I don't care for color nor for the cost, but I want a queen tested for *business*." Dr. Miller also said, in private conversation, that he would willingly pay \$3.00 each for queens for his whole apiary, if he could be sure that he would thereby get queens as good as the best that he now has. Don't you see, friend Cook, that the people are willing to pay high prices for queens, if they can be assured that they will receive the worth of their money, but that they do object to paying \$5.00, or even \$2.00, for a queen that, in all probability, is no better than one that can

be bought for \$1.00? Now, if I have made any misstatements in the above, or have given a different shade of meaning than he intended to convey, I beg friend Cook's pardon, and hope he will correct me.

#### AT THE CONVENTION.

How pleasant it was to meet, and grasp the hands, and look in the faces, and listen to the words of wisdom that fell from the lips of those whose writings I had read so many years, and whom I had so longed to see! The discussions at the convention were upon practical subjects, and right to the point; but none the less interesting and instructive was the exchange of ideas when "congenial spirits" gathered morning, noon, and evening, around well-supplied tables; collected here and there in nooks and corners, and out-of-the-way places, in little knots of two or three, or groups of half a dozen, or bed-fellows lay awake and "talked" far into the "small hours." Then there were the chats among friends at the railroad depots, while some of their numbers were waiting for a belated train. Taken all in all the convention at Kalamazoo was a very happy and profitable affair.

#### \* A VISIT TO LAPEER.

On the way home I was fortunate in having for a traveling companion Mr. L. L. Taylor, a bee-keeper of Lapeer, Mich. About 7 o'clock in the evening, when perhaps about 15 miles west of Flint, the train began to run slower and slower and slower, and finally it stopped; then it went on a little further, and stopped again. Upon looking out there could be seen, a short distance ahead, the headlight of another locomotive. We soon learned that there was a freight train ahead, a part of which was off the track, and four long hours dragged themselves along before every thing was righted and we moved on. As it was so late, friend Taylor thought that I had better go home with him, and, as I could come back to Flint the next day, and reach home just as soon as though I did not go, I accepted his invitation. I am very glad that I went with him. Had I known that there was so progressive a bee-keeper living within 20 miles of myself, I should—well, I *might* have made a nuisance of myself by visiting him too often. Friend T. has an Adams' horse-power (by the way, these horse-powers are manufactured in Kalamazoo, Mich.), which he sets up upon his barn floor and runs a buzz-saw with which he cuts up stuff for hives. He has a Given press for making fdn., and as I had never seen a machine of any kind for making fdn., I felt that the sight of that alone had paid me for my trip to Lapeer. Friend T.'s method of measuring and cutting off the wire for wiring frames is different from any thing I have seen described. He winds the wire lengthwise around a strip of board 4 or 5 inches wide, and of such a length that, when it passes over one end of it, the pieces are just the right length for wiring a frame. In order to be certain that I am understood, let me say, that, when the board is wound with wire, it might be compared to one of the little boards from which rubber cord is retailed in stores. Before cutting the wire at one end of the board, friend T. wraps a piece of paper around the board, near the end upon which the wire is to be cut, then winds a string around outside of the paper, draws it up tight, and ties it securely; thus, after the wire is cut, it remains upon the board, and one piece at a time can be drawn out when wanted. A largeshare, if not the whole, of friend T.'s bees are in an apart-

ment of his cellar, and in another apartment is a furnace which insures perfect ventilation.

W. Z. HUTCHINSON.

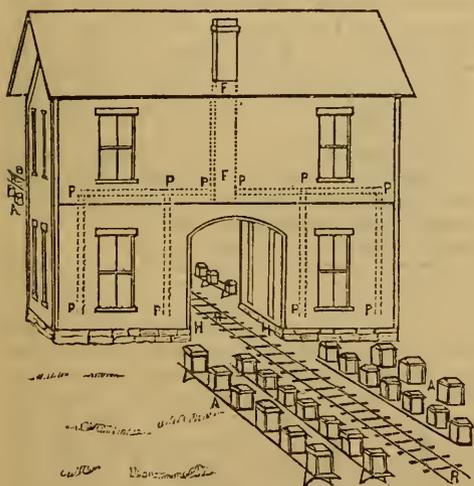

Rogersville, Genesee Co., Mich., Dec. 20, 1882.

I am very glad to find two mutual friends of mine so well pleased with each other, friend H., and I am sure you two will always be fast friends, even if you should not eventually think alike on dollar queens.—The plan you mention for getting wires of the right length for wired frames, is exactly the same we have used for more than a year past; and if I have not mentioned it in GLEANINGS, I ought to have done so. As the wires are apt to cut into the sharp ends of the thin board, we tip both ends with tin.

### PLAN FOR A HONEY-HOUSE.

COMBINING, ALSO, AN IDEA FOR A RAILWAY APIARY.

**T**HIS house is built in two sections, 12x12 feet, with a hall between, 8x12 feet. This makes the house 12x32 feet, outside. The house as sketched is a two-story one (the upper story may be left off); but as a two-story house can be built without any additional expense as to foundation, rafters, sheathing, shingles, and roof nails, it will be seen that it will pay for all extra expense, for it affords twice the room, and occupies no more ground.

PLAN FOR A HONEY-HOUSE.

A, A, apiary; R, R, railway track; H, H, hall through building; P, P, tin ventilating-pipes opening into lower rooms near the floor, and entering brick flue at F, F. A fumigating closet should be arranged at one side of the room, with a pipe running in the flue above. This pipe will require a valve, which may be opened and closed at pleasure. This closet, like the others, should correspond in width with the length of frame you use. Make wooden grates by taking three strips, same length as top-bar, and nail across sections. These grates can be slipped on the cleats on sides of closet for section-box honey.

The hall to this house runs from outside to outside, through the center of which runs a railway track 30 inches wide, made of 4x4 hard-wood scantling.

This track terminates with the apiary on the back side, and at road gate on front side; over this track is transported the honey to and from the house.

A door opens at the center of each section into this hall; the one leading from the room in which the extracting is done should be of such width as to admit of barrels being rolled through. On both sides of this door are to be comb-closets. These may be made of any depth desired from 12 to 20 inches, and of such height as can be easily reached from the hall. These closets are to correspond in width with the length of the top-bar of the frame you use. Nail wooden cleats to the sides of the closet on which the combs hang; arrange in tiers one above the other. Close-fitting doors are hung to these closets, both inside and out. The inside furniture to this room should be a stand, of convenient height and length for the extractor to stand upon; racks for barrels, and counters or benches for any other honey packages you may wish to have. At extracting time the honey as brought in is hung in one closet, and the empty combs in the other. The stand upon which the extractor is fastened should be to one side of the center of the room—a low pair of trucks, or, rather, a frame, made by framing 4x4 scantling together so as to form a frame 14x24 inches; put castors under each corner of this frame, with a notch in each end-piece for the barrel to rest in, and your trucks are finished. Place a barrel upon it and run it under the extractor; when full it can be easily removed to any part of the room.

The other lower section of the house is fitted up with shelving, suitable for section-box and can honey, from 1 lb. up to 48 lb. crates, with counter and scales ready for your retail trade. The upper story, which is 12x32 feet, makes a good and safe room in which to store your empty combs, and any other fixings belonging to the apiary not needed during the cold season. The sides and ceilings of the house should be plastered, or ceiled with dry lumber, so that it is moth and bee proof. This house will be found sufficiently large to accommodate the wants of an apiary of 200 or 300 colonies. R. B. ROBBINS.

Bloomdale, O., Dec. 10, 1882.

### IS IT TOO HARD WORK FOR WOMEN?

MRS. HARRISON HAS DECIDED OPINIONS IN THE MATTER.

**T**HE woman who advocated that "bee-keeping is too hard for women," ought to be ashamed of herself. I've forgotten who she is, and haven't time to look her up. I'm heartily ashamed of her. Perhaps after all it was a man who wrote that, and signed a woman's name to it. "Too hard!" that is the cry of those who dwell in gilded palaces. "Can't work; I'm not able." Look around you, and see what other women, of no more brawn or muscle than yourself are doing. That farmer's wife, for instance, who cooks for harvesters, over a hot stove, with a teething child pulling at her skirts all day, and her breasts all night; the poor widow (Heaven pity her!) toiling by a midnight lamp, in order to have shelter, cheap tea, and a crust for herself and little ones. Is it any harder to keep bees than it is to be laced up in corsets, tilted up on high heels, with crinoline, bargs, and a bustle, and dance all night? Do you think the *stings* are any easier to bear than in bee-keeping?

Here I've been trying for years to get women to

keeping bees, in lieu of making overalls at five cents a pair, and darned lace at famine prices, and you raise the hue and cry, that it is "too hard for women." I should have expected that the men, instead of women, would have raised this din, in order to keep us out of the business, for they have always preferred the soft places, such as preaching, and marrying people at five dollars a head. What would you have women do to support themselves, or even make a little spending money? Many women have a home to keep, young children, and an invalid husband to care for, and either no income or an insufficient one. What can she do easier than to keep bees? Go out to wash, or make shirts at fifty cents per dozen, eh?

We opine, that the author of that saying, "too hard for women," never earned a dollar in her life. She may have worked around home in a general way, but never was dependent upon her own exertions for a living or clothing.

Is it any harder to climb a tree, and get down a swarm of bees, than it is to gather cherries, or wash a window? to put on boxes, or take off honey, than to make bread, or wash? I'm not strong enough to carry a heavy-laden hive "up stairs, down stairs, or into my lady's chamber," and I don't do it. I let them stand where they are; if I wanted them carried around, I can make money enough at the business to hire men to do it for me — men who have not intelligence enough to keep bees either.

It is hard work, and plenty of it, to make bee-keeping a success; and what can we do, and make a success without hard work? Some people are always on the alert to get something for nothing, and are the class who get humbugged.

Peoria, Ill., Dec., 1882.

MRS. L. HARRISON.

Well done, my good and tried friend. You and I agree first rate on all this; but in behalf of the imaginary culprit you have so severely taken to task, I would say that no one said, in GLEANINGS, that bee-keeping is "too hard," but a sister simply asked for your opinion in the matter; and not only has she got it, but I imagine that pretty nearly all of us now understand you.

## TRoubles WITH THE RAILROADS, AGAIN.

### WHAT SHALL WE DO?

**I**N GLEANINGS for Nov. and Dec. you ask what ought to be done with the trunk-smasher. Let me narrate my first experiences with the railroads of this country.

Before my arrival from France at New York, 20 years ago, I had been instructed by a friend of mine to come west via Allentown, in order to avoid changing cars between New York and Pittsburgh—the change of cars, especially at night, being very difficult for a stranger unable to speak English. Accordingly, in company with a countryman who resided in New York, I hunted for the designated railroad, and visited all the railroad offices on Broadway. None of them could tell me where to find this line. All offered me their tickets. Their railroad was the shortest, the fastest, the cheapest, that I could find. At last, after several hours of search, I concluded to take a ticket via Philadelphia. On my return to the hotel, the landlord told me where the office of the desired railroad was, but it was too late,

since I had paid for my ticket. This talk of veracity, unknown in Europe, where the companies don't compete with each other, is a bad show for a stranger.

I reached Philadelphia at ten on a dark and rainy night in March. The conductor of the train, who had been asked by my countryman to help me in changing cars, did not care for me, and the connecting train was gone before I had been able to find somebody to understand me. My hotel expenses amounted to two dollars. At Fort Wayne my trunk was hurled from the car, and missed the kind of ladder used for a slide, and, falling on the ground, was burst open. While I was gathering my scattered goods, and grumbling some French words of indignation, the baggage-man continued gaily his work, whistling and laughing. Yet to keep my trunk shut was, to me, a problem to solve. Fortunately a Canadian, able to understand a few French words, asked me for 25 cents, and went to a store to get a rope. When the repairing was done, the train of the Toledo, Wabash & Western was just gone; and as the next day was Sunday, my too-small pocket-book was lightened of two dollars again, for my hotel and traveling expenses.

Such circumstances, and worse than that, are of every-day occurrence. I have, as employe, a countryman who, desiring to go from Davenport, Iowa, to New Orleans, was sent to Chicago, thence to Cincinnati; and would be yet on the way had he not met a man who put him on the direct road. Last summer I saw a poor woman, with two young children, weeping for having been sent over a line which did not connect directly with the designated station. She was compelled to wait a whole night while her husband was waiting at the station, ten miles from his home.

You say that the railroads are subjected to shameful losses from the farmers, who order goods thoughtlessly and then refuse to take them from the office when charged more than they expected. Let me say a word about that:—

At several times I have noticed that, when a package goes through three lines, the intermediate line profits, by being out of reach, by increasing its rates; and sometimes to such an extent that the third line refuses to take the goods, fearing that they are not worth the exorbitant charges asked. Such was the case with the carload of fence-posts, of which I spoke in my article in your Nov. No. This carload was weighed by the Wisconsin Central; when it reached the Chicago, Burlington, & Quincy, the weight of 26,500 lbs. was increased to 36,000 lbs.; at Bushnell, the agent of the Wabash, St. Louis & Pacific refused, at first, to take it, on account of the exorbitant charges. Then, after a few days, this last railroad took it in spite of our refusal, and asked its rates on the fictitious weight, although we had proved that the posts had been twice weighed. Their answer was, that they had the right to do so.

Now, suppose that your grocer had sold you some sacks of flour and other articles, and that, when you settle with him, he charges 150 lbs. instead of 100, and increases the weight of every article in proportion. Do you not think that it would be your right, and *even your duty*, to have him fined and sent to jail, in order to stop such a brazen stealing?

But, you can not have the railroad owners sent to jail, for the railroads have no personality. They steal openly, impudently; and as their attorneys are paid by the year, they don't care for lawsuits.

If you dare to prosecute them they will try to harass you by appealing from court to court, increasing your expenses to several times the amount in contest. Such is now their regular way of paying damages. They are as hard on the people as the kings and nobles of old.

Yet these railroad owners are public servants, for the railroads are public services, and no doubt about that, since it was on that account that they were granted the right of expropriating the owners of land, in spite of their refusal. Then we, the public, have the right to control the railroads; the right to take them in our hands, as we would take from an unfaithful servant the money and goods intrusted to him. The act could not be called an act of anger or revenge; it would be an act of justice, an act of self-protection. As to your question, "What shall we do with the baggage-smasher?" My advice is, not to go for the man who smashed your baggage, but for the corporations who tolerate such acts, and perpetuate, every day, hundreds of acts worse than that. The small employes of the railroads receive too little pay not to greatly suffer by the smallest reduction of wages. You publish a paper read by intelligent people all over the country; open a column against the abuses of the railroads, not in the spirit of anger, but for the sake of justice. You will find your reward in the satisfaction of having helped a good cause. CHAS. DADANT.

Hamilton, Ill., Dec. 8, 1882.

I know, friend Dadant, that things are bad; but I can not but think that you dwell on the worst side of the matter. Our business with railroads has been large, and extends over almost all the lines in the world. We, of course, now and then have grounds for complaint; but when we do so we state the matter pleasantly; and it gives me pleasure to say, that every claim we have ever sent in, of any account, has been in the end allowed us. I have just now asked our book-keeper about it, and she says there is no single claim standing against them, to the amount of *one dollar*. If my groceryman should charge me for 150 lbs. of flour when I received only 100, I would go to him as I would to a neighbor, and lay the evidence before him; and even if he were a *bad* man, I think I should get courteous treatment, and justice.

Deciding to settle things by law is a serious matter, and I should want to advise almost every thing else before advising it. When goods are lost or damaged, or there are overcharges, we make a statement of the matter, and it goes back over the route, each agent appending his note to it. Sometimes the mass of correspondence and bills required to get at the error is a large bundle, and it may be that it was all about only 25 cents. I once told our agent, that if it made them all that trouble for so small a matter, I would rather pay the overcharge myself, and say nothing about it. I saw by his look that he appreciated the neighborly spirit. A short time after, we received a barrel of wax with a stave broken out, and about 25 lbs. of wax missing. I sent in my claim for damages, and received a reply, not very courteous or complimentary, to say the least. It stirred me up pretty well, and I was in just the humor for a fight by law; but on reflection I

wrote, expostulating, and yet in a mild way, and to this our agent appended a little note, to the effect that he knew me personally, and that I was not a man who would ask for damages unless I had the best of reasons for so doing, and to the effect that I was always averse to making anybody trouble, when it could possibly be avoided. They paid for the wax at once.

I dwell on this because it is a most vital point before our growing young men. You know I am not boasting, but that I only seek to make peace. Now, then, to business: If I were to go to your station agent, any of you, and ask him what kind of a man you are, would he reply as above, or would he say you were always finding fault, hard to get along with, etc.? Had I gone to headquarters, and told them the story of my trunk, I feel sure I should have had courteous treatment; but, dear friends, if I have unconsciously earned a reputation for being one who "thinketh no evil," and that among swearing men too, I would not for the world spoil it. I would rather buy five cents' worth of rope as I did, and resolve to have a stouter trunk next time. I do realize what an outrage it was on you, friend Dadant, when you were a stranger in a strange land, and I pray that God may help us to have it done away with; and if it can't be done by kindness, then let us have it done by law.

### HONEY FROM WHEAT-STUBBLE.

WHEAT THE GREAT HONEY-PLANT, AFTER ALL.

BY to-day's mail send you a sample of wheat-stubble honey. The first day I cut wheat I noticed the bees working on the stubble, and I examined it and found that a clear drop of sap had run out of every stubble, and some had filled the upper joints, and some was running down the stubble. I tasted it and found it to be very sweet; and that day at noon I extracted the honey from the upper combs of one stand of bees, so as to get a sample of wheat-stubble honey. In five days I extracted 15 lbs. of this syrup, as I call it, from those same combs, and it was from the stubble, as there was nothing else for the bees to get honey from. We had the best wheat crop for many years, and the grain ripened before the straw; and when cut, the straw was full of sap. I think if you will cut wheat with the straw a little green the sap will always run out to some extent. I noticed it run out of the Flets wheat the most, as it had a very hard straw. This cutting green accounts for friend Lybarger's frosted wheat, which he says he cut before it was commonly called "dead ripe."

THE FIRST YEAR AS AN A B C SCHOLAR.

I will hereby give you a sketch of my report for 1882: I am well pleased with my first year's business. I began the season with five stands, four blacks and one Italian. I transferred all to Simplicity hives, and they worked out 30 lbs. of foundation, all in wired frames, and gave me 500 lbs. nice honey, all extracted except 100 lbs., for which I get 20 cents for extracted and 25 for comb. They increased by natural swarming to twelve, all in good shape for winter, and all Italians but three. My Italian stand that I had in the spring, and increased two swarms, gave 300 lbs., all extracted. I received four first

premiums at our county fair. So much for GLEANINGS and A B C. C. M. DIXON.

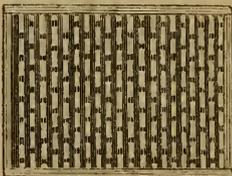

Parrish, Ill., Dec. 27, 1882.

Well, I declare, friend Dixon, and I say it, too, while I smack my lips over that honey, or syrup (I think I should call it syrup). I am going to sow a field of wheat, just on purpose to see if I can find honey by cutting it at different times. Why, bless your heart! it beats spider plant, Simpson plant, and all the other plants all hollow—it is the straws that are "all hollow," where the honey is, you know. What will ever become of us? Friend Miller, you can just go and dig your figwort roots all up, and plant wheat. Put phosphate on it, you know. Friend D., don't you know whether spring wheat will do? Can somebody else tell us more about it? Can't we get wheat that will ripen before clover comes? Oh, yes! I forgot to say it isn't the very nicest kind of honey, but you know we could let them fill up the brood-chamber with it, and that would save our white-clover and linden honey. It has a taste very much like green wheat straw. Friend D., was it nicely sealed up when you extracted it? Why, our friends in Texas are nowhere now with their horsemint honey. W-h-e-w! Oh! hold on a minute! Do the bees crawl clear down to the bottom of the straws, or have we got to raise a new race of long slim ones?

### HONEY-BOARDS MADE OF PERFORATED ZINC.

SHALL WE EXCLUDE THE QUEEN FROM GOING "UP STAIRS"?

**H**OW many are there of us who use two-story hives, who have not at some time been annoyed by having the frames of the upper story glued fast to those of the lower one by honey bridged from one to the other, and all built together solid? In the Simplicity and chaff hives we have tried to obviate it by reducing the space to  $\frac{1}{4}$  or  $\frac{3}{16}$  of an inch, and with some stocks of bees this will answer very well; but with others they seem bound to fill this space, no matter how small it is.

A "QUEEN-EXCLUDER" HONEY-BOARD.

The A B C class have often asked if we used a honey-board, or if an enameled sheet was not to be left between, and some have said this latter sheet with holes in it answered tiptop. Well, besides this trouble there is another one, from having the queen get above and laying eggs in the sections, for where we have extracted honey she would go above and lay great numbers of drone eggs, especially if we tried to utilize our drone combs for the extractor, and I believe it is pretty well demonstrated that the

bees will store honey quite a little faster in drone combs than worker, during a heavy flow. Well, a honey-board made of perforated zinc, made as shown in the cut below, fixes all these troubles at once. They have been used enough the past season to demonstrate that they will do all we wish, and the evidence seems to be pretty strong that the worker bees carry honey above just as freely as if they were not there. At present we are able to furnish these perforated zinc honey-boards, lined around their edges with folded tin, for an even 25 cents each. This is for the regular L. frames, and they will fit Simplicity, chaff, or almost any form of L. hives. On account of weight they can not well be sent by mail without injury; but where wanted for a sample, we can send one by mail for 25 cents extra.

### HALF-POUND SECTION BOXES.

MUST WE HAVE IT? AND IF SO, WHAT ARE TO BE THE DIMENSIONS?

**A**S there seems to be a demand springing up for half-pound sections, I have been trying to settle down on the shape that will be the most convenient to use in the Simplicity hive. I have made up my mind to use a section  $4\frac{1}{4} \times 3\frac{2}{3} \times 1\frac{1}{2}$ ; you will see that it will just take 10 to fill a frame  $8\frac{1}{2} \times 17 \times 1\frac{1}{2}$ , and it will take just 10 such frames to fill the Simplicity upper story, and it will take just 10 sections to each course in the Simplicity shipping-case, and take 100 sections to the case. I think you will like this plan, as you always like to count by ten and hundreds.

By using narrow slats in the bottom of the 23-lb. honey-rack it will hold 50 of the half-pound sections. The combs will be so near the thickness of natural comb that the bees will be very likely to build straight combs without separators, and if we should need separators we can use the same kind of separators that we use between the 1-lb. sections. I should like to hear from you and others on this subject. Please arise, and let us hear from you.

Rantoul, Ill., Dec. 21, 1882.

J. A. OSBORNE.

Friend O., I like the idea of tens and hundreds tiptop; but I don't quite like your making the sections narrower, so they won't fit in the wide frames that hold the usual 1-lb. sections. It will be an enormous expense to the bee-keepers of our land to lay aside the wide frames and separators we have already in stock, and it will be complicating matters greatly, to even use something different in the new hives we may make or purchase. At Kalamazoo we talked about having 12 sections go in a wide frame in place of 8, and this same size would then go in all of our shipping cases and crates as well. In regard to prices for making them, unless some definite size is decided upon, so that we can keep machinery on them right along, we can not well give better prices than for the 1-lb. sections. The work on them will be nearly the same, any way, and the amount of material will make but little difference. To be frank in the matter, I somewhat doubt our ability to supply the demand for sections this season, and would advise all who don't want to be disappointed, to be getting their orders in at once.

## LEARNING TO KEEP BEES.

AN A B C SCHOLAR OF LESS THAN A YEAR'S EXPERIENCE.

**I** BEGAN to keep bees last spring. I had read about them in a general way before; but about that time I began to read GLEANINGS; and, as a natural consequence, I soon had a very bad case of "bee-fever," and determined to keep a few myself. I did so with many misgivings. I live in the city of New York, but well above the thickly settled portion. There are no farms within miles of me, and of course no buckwheat. There is very little bass-wood, and not much white clover. I thought that a few colonies might manage to live; but what troubled me most was the fact that I would be away from home during July and August. I have since found out that bees do well, even down in the heart of the city, on the roof of a store, but I do not know of any that are left to themselves during two whole summer months.

### BUYING SUPPLIES, ETC.

I wrote for prices to various parties, and in due time had lots of circulars. Not knowing any of these dealers, I thought I would establish a sort of competitive examination, and order bees to the same amount from several, and so find out which did the best; but the bees reached me at such irregular intervals that the test did not amount to much. I would advise my brother-beginners, before ordering from an unknown party, to find out two or three points: 1. How large a "frame" is; 2. Whether it is to have brood and honey in it, or not; 3. Whether the seller is going to keep your money long enough to raise the bees after he gets it, or until the price has fallen considerably.

Don't understand me as meaning that bee-men do business in this way as a general rule; but the beginner will not be any worse off for knowing that a three or four frame nucleus from one dealer is sometimes a good deal larger than a so-called "full colony" from another.

### ALBINOS.

For the sake of variety I ordered one nucleus of albinos. I don't know whether I got the right sort of albinos, but I have received Italians from other dealers which no one can tell from those sold as albinos. Is there any distinctive mark, or is it only a question of a shade lighter yellow?

I received my first bees on the 16th of June, and I must confess that it was with a great deal of hesitation that I began my first actual experience. I set the shipping-box inside of one of my hives, and removed the wire cloth. Of course, the bees came out with a rush, and I sat down very suddenly. I expected they would come out; but when they did I felt embarrassed. I concluded that they were country bees, and so I left them for a couple of hours to get used to city life.

After I thought they had settled down I opened the box, took out the frames, and hung each of them between two of mine in the hive. Then I shook off the bees from one frame, carried it off a few rods and transferred the comb, returned it, and took the next. All this time I was expecting to get stung, and was rather astonished that I did not. I knew that all the authorities said that one need not be stung, but I have found out that green hands in any art are pretty apt to have these little needless things happen, and I had counted on a dozen stings at least. I will add here, that though it still makes

me nervous to have a bee fly at me, and though I have "fussed" over my bees continually, when they were in a good humor and when they were not, I have had only three stings in all. Twice I thought the bees served me exactly right for my carelessness, and the third time I guess they did it only "for fun." A bee-sting doesn't hurt me much, and I can never find the place half an hour afterward.

### SMOKE FOR BEE-STINGS.

I can not, however, agree with you in denying that smoke may be a positive relief for stings. I once, while out camping, tore a good-sized piece of the thick skin off the palm of my hand, making a very bad sore. I was urged to try the smoke from burning sugar for it; and though I had no faith in it I did so, and was astonished at the relief it gave me. Next time you hurt yourself, just smoke the place with sugar till it is yellow or brown, and see.

### GETTING A SWARM OF HYBRIDS, WITHOUT BUYING THEM.

My second nucleus came June 28th. The dealer who sent them sent an empty hive with them to make up for the delay. I was very busy that day, and so I told the boy who brought them from the express office to leave them in the shade near the others, and not to open them. Now, it was nearly dark before I had time to attend to them. When I did go out I found lots of bees flying from the hive, and thought at first they had got out, but found, on examination, that one of the hives was closed with wire cloth, and contained four full and one empty frame, with a proper number of bees and a queen. After transferring them it was so dark that I could only see that in the other hive were four empty and one full frame. I thought the full comb had been put in there to give the bees in the other hive more room, and that my first bees finding it unprotected had attempted to rob it. As it was so late I thought I would not do any thing about it, but would come out early and see that their robbing stopped with that one comb. Next morning the hive seemed full of bees; and on noticing them more closely I found they had only two bands, and were darker than the others. This set me to investigating, and it was not long before I found out I had a fine swarm of hybrids. Where they came from I do not know; but there they were already hived, and they have been doing well ever since, raising a pure queen for themselves from brood given them this fall. If the empty hive had been there for several days I should not have thought it so strange; but the bees came the same day the hive did. Now, what do you think of it? I wrote to the man I bought the bees of, and he said he sent only one colony and an empty hive. Is it possible, that in the few hours that hive stood unoccupied, the bees found it, concluded that it was a good place to keep house, and moved in, bringing their queen along? I thought the hive might possess some hidden virtue; but though I "set it again" after transferring, I can not report any further captures.

All of my "dollar" queens, and I have bought no others, have turned out pure except one. That one I am in doubt about. Most of her bees are beautiful light Italians, with three bands; but once in a while I see one that has no yellow at all. No one would notice them unless looking specially for them. Would you call that queen a hybrid?

### MELLIOT, ETC.

White clover bloomed here June 9th, and the tulip-tree (whitewood) on the 10th. I never saw a bee on

white clover, though I watched it very closely. The tulip just roared with them. But when mellilot opened June 25th, the bees left the tulip for it. I do not think half enough has been said in favor of mellilot. My bees began work on it June 25th, and every time I looked at it from that time until Nov. 12th, I found bees on it. The only trouble was, that there was not enough of it near me to go very far. I don't mean that the same plants lasted all that time, but in one particular patch of it nearest my bees there were some plants in bloom, and the bees working on them during the whole time. This, too, although July and August were very dry months, and though we had several frosts in October and the first part of November. It grew on and near the railroad, and seemed to do as well in a bank of broken blast-furnace slag as anywhere else.

#### THE HORSE-CHESTNUT.

Another source of honey that I have not seen mentioned is the horse-chestnut. It is a favorite shade-tree here, and during the time it is in bloom it is covered with bees until the raspberry opens. Even then they work on it in the morning. Its great value is, that here it fills the gap after fruit-bloom. Suppose you try two or three in the honey-farm.

#### DO BEES VISIT SEVERAL KINDS OF BLOSSOMS FOR A LOAD?

One more item: Prof. Cook says that a bee visits only one species of flower on each trip. I have the impression, that you indorse this view. I have repeatedly seen bees fly from peach to apple blossoms, and also from blackberry to raspberry, and *vice versa*. In the second case they had pollen in their baskets. I did not notice pollen in the first. In each case one of the plants was failing.

My account with my bees stands as follows:

By hives and frames on hand, - - -	\$29 00
" material and implements, - - -	10 68
" 5 swarms (pure and strong), - - -	50 00
" 2 " (hybrid and weak), - - -	12 00
" 41½ lbs. extracted honey@16, - - -	6 64
" 1 " comb honey, - - -	20
<hr/>	
Total receipts, - - - - -	\$108 52
<hr/>	
To materials and implements, - - -	\$20 68
" bees and express charges, - - -	24 60
" labor, - - - - -	140
" feed, - - - - -	2 00
<hr/>	
Total expenses, - - - - -	\$48 68
Balance (clear profit), - - - - -	\$59 84

Which is over 122 per cent of the amount invested. My bees had over 200 lbs. of sealed honey Nov. 10th, which I left to make sure of abundant winter supplies, so perhaps I shall have some left in the spring. I would not sell any of the stock on hand at the prices I have put on them.

Perhaps in perfect fairness I should have charged the bees with my labor in hive-making, etc., but I can't tell exactly how much it was, as I worked only at odd times; but a carpenter would do the same work better for \$ 0.00. On the other hand I have not given credit for twenty-five or thirty dollars that I would probably have spent for recreation in the time devoted to my bees, nor for at least a hundred dollars' worth of pleasant and interesting amusement and instruction.

As on May 1st I had no bees, I suppose I must sign myself — F. D. CLARKE, 0.

New York City, Dec. 15, 1882.

Friend C., although your letter is a little long for a beginner, there are several points in it I would commend. Principally, among

them your concluding thought, that without the bees you would have spent a good deal of money for recreation (and may be not found it then) that was saved by keeping the bees. You also have not greatly exaggerated it, I believe, when you say you have had a hundred dollars' worth of amusement and instruction.—About the albinos: I entirely agree with you. They are only a strain of lighter Italians, and never ought to have been called albinos.—I presume we shall have to give up, that bees do load up from different plants at times, but I did not know it before.—May I suggest that the smoke helped the pain in just the way our minister helped the horse that balked? It was a livery buggy, and we were going home from a picnic. The horse balked in a very trying place, with a string of teams behind us. "Wait and I'll fix him," said he, and out he sprang, and unbuckled the girth, flopped it back and buckled it again. The horse turned his head, as if to see what was broken, and in so doing his "horse sense" forgot the "pout," and when his driver jumped back into the buggy, and chirruped to him in a natural way, off he went, and we were all happy. When you smoked the "hurt place" you forgot the pain, and were "cured."—I should call the queen a hybrid.

#### HOW TO GET QUEEN-CELLS, WITH THE OLD QUEEN IN THE HIVE.

##### TWO, THREE, OR MORE LAYING QUEENS IN ONE HIVE.

**L**AST spring I had occasion to get the brood all out of a lot of about 30 combs as soon as I could; and as the weather was too cold to take them away from the bees, I had to devise some plan to keep the queen away from them, and to give the bees access, which was as follows: I removed the covers from 3 Simplicity hives, with stocks in, but left the cloth cover on, slipping it back only about ½ inch, so as to let the bees pass up; then I set on a second story, and in these I put 10 combs of the brood I wished to get out, without any hatched bees, then put on a quilt and lid. After a week's time I looked to see how they were doing, but was greatly surprised to find quite a lot of fine capped queen-cells in each of the 3 upper stories.

As it was too early to divide, I thought I would let them remain, and try the experiment to see what I could make of them; in hive No. 1 the cells were all torn down about the time they should have hatched. Whether a queen ever hatched there or not, I do not know; but I could never find one. No. 2 hatched a fine queen, and kept her until time for her to fly out to meet the drone; then she was missing. I can not tell what became of her. No. 3 also hatched a fine queen. In due time she became fertilized, and began laying in her proper apartment, the upper story; then I set the story off, and had a new colony with a laying queen, without any introducing, and still have it.

I will add, that when I found the young queens hatched, I raised the top story half an inch to give an upper entrance, and to give the young queens a chance to go out and return without going to the lower apartment; but at all times the bees had free communication between the two stories. I did not try the plan again, but I am satisfied that by it I

can get queen-cells whenever I wish, without making the colony queenless. In neither case was the queen below disturbed in the least.

A. A. FRADENBURG.

Port Washington, O., Dec. 18, 1882.

Friend F., you have omitted to tell us whether the old queen went up and laid eggs in the upper story, among the queen-cells. I presume not, though it would be very desirable to have them do so. I have had two colonies in a one-story hive, and reared queens in one while the other kept on laying; but the latter always stayed on "her side of the house," even though the combs were not separated at all.

### BLACKS VERSUS ITALIANS.

ONE CANDIDATE YET REMAINING, IN FAVOR OF BLACKS.

**I** NOTICE on p. 617, December No. of GLEANINGS, you advise D. D. Lester to "replace all black queens with Italians." Now, I have kept both blacks and Italians for the past four years, side by side in Simplicity hives, and the blacks have done best every time. I have spent considerable money (for a poor man) in trying to get some Italians that would beat my black bees gathering honey; and with that end in view I sent to Doolittle for one of his choice tested queens in June, 1881; of course, I didn't expect her to do much that season; but this year I thought the blacks would have to take a back seat; but they came out ahead as usual. I also bought queens of H. Alley and J. M. C. Taylor. Now, I think four years of fair trial with queens purchased from well-known breeders is a fair test, for this locality at least, and I propose, this coming season, to "replace all Italian queens with black ones."

Now, my black bees are nothing to brag of; 75 lbs. of comb honey is the most I ever got from one colony; but that is better than I ever did with Italians. I have no doubt that the Italians will do better than the blacks in some localities; but here the season is very short, commencing with fruit-bloom and ending with white clover, about July 4th; and colonies that have not enough honey in their hives to last them over winter will not get it that year; and if not fed in the fall, they will starve. I did not get any more honey by introducing Italians, but I have got a lot of savage, vicious hybrids that will sting anybody who comes near their hives.

One thing I notice about my bees (blacks, Italians, and hybrids), that is not in accordance with the doctrine laid down in the works of Root, Quinby, Langstroth, Cook, and other authorities: They sting worse when honey is coming in freely than at any other time.

W. E. FLOWER.

Ashbourne, Pa., Dec. 13, 1882.

Friend F., it is surely accidental, or because you have not yet got the "hang" of the Italians, with their peculiarities, that makes it seem to you that the blacks are ahead. While reading your letter I watched to see if I could tell whether you used an extractor, or worked only for box honey. I rather think the latter, and this may be one reason for your experience, although I should suppose friend Doolittle's strain would make comb honey, as a rule. I would not replace the Italians just yet, if I were you, for you, like all the rest, will surely

change your mind after a little further experience. It occurs to me here, that an illustration I used in my Sunday-school class last Sabbath may be of use to many of us. The boys thought the best evidence a person could have would be his own eyes. To show them their mistake I gave them the following: Suppose, boys, I should see Mr. Jones on the street to-morrow; but on mentioning it afterward, Mrs. J. and all the family should assure me that he was confined to his bed by sickness, and never arose once during the whole day. If the family had some object in proving that he was not up town, of course I might question their sincerity; but in this case they were disinterested witnesses, and one would be well nigh crazy who would presume to say they were either mistaken or dishonest. Which am I bound to believe, my own eyes or the testimony of perhaps half a dozen good people? It is quite possible, I might have met somebody who looked so wonderfully like him that my eyes were cheated; but it is probable they had somebody in bed all day, who was not that identical husband and father? Well, now, it is not half a dozen witnesses that testify in favor of Italians, but it is thousands of our countrymen, friend F.; and as further proof, tons upon tons of honey are piled up yearly by those who never think of offering queens for sale, but only get bees to get the most honey, and comb honey at that. I can not agree, either, that any locality, or any sudden flow, would favor the blacks and not the Italians. Where you get 75 lbs. of comb honey with black bees, I should not be surprised to see friend Doolittle, with his strain, get toward 150, and I say this without intending to reflect on your skill at all. Your concluding idea, that your bees sting worst while getting the most honey, I must think also an accident rather than a rule. If I were at your place when the honey-yield suddenly ceases, it seems to me I could surely show you the bees behave worse when they begin to try all around to rob their neighbors, Is it not so?

### OREGON, AND ITS ADAPTABILITY TO BEES.

ALSO A VALUABLE REPORT ON HONEY-PLANTS FOR ARTIFICIAL PASTURAGE.

**T**HIS is a very good climate for bees. There is but very little extremely hot weather in the summer, and the winters are mild; there is but very little freezing weather, and not much snow. It is no trouble at all to winter bees on their summer stands here, without extra care. Very few bees die through the winter, and swarms nearly always come out strong in numbers in the spring. There is no bee dysentery here. About the only losses are those that do not store honey enough to keep them through the winter. The only protection they need in the winter is a roof to keep the rain off from the hives, as it rains a great deal here in the winter.

This is not a very good bee country naturally, for one reason, and only one: there are not flowers enough here of the kinds that bees work on, especially in the latter part of the summer, and in autumn.

There are some localities where bees do tolerably well, and others where they will scarcely make a living. There are some localities in this part of Oregon where white clover has come in naturally in large quantities; on that, bees do quite well, and make quite a lot of white-clover honey.

White clover blossoms here about the middle of May, and continues in bloom about 2 months, when the dry weather dries the blossoms up for the season.

THE PURPLE-BLOSSOMED FIREWEED, AGAIN. (SEE PAGE 514, OCT. NO.)

There are other localities, mostly in the mountainous regions, where there have been fires in the timber, where there grow large quantities of elkweed, called by some fireweed. In such locations bees make large quantities of elkweed honey, which is of a clear, greenish-white color, and has a peculiar flavor which does not suit my taste as well as clover honey. It grows from 4 to 7 feet high, and each stalk terminates in a long spike of pink blossoms. In the center of each blossom is a small drop of honey. Elkweed blossoms about July 1st, and continues in blossom about 2 months, when it soon all ripens, and the air is filled with its feathery seeds. The pollen from elkweed is bright green.

In the Coast region, which lies between the Coast Range and the ocean, there is considerable maple timber, which blossoms about April 1st, and stays in bloom about a month, from which bees make large quantities of honey of good quality, fully equal to clover, I think.

There is also much huckleberry, from which they gather considerable honey, of good quality.

Bees swarm here mostly in May and June. A moderately large swarm of bees requires about 15 lbs. of honey to keep them through the winter here. I think bees would do well here, if any one would sow artificial pasturage for them, so they could have plenty of flowers to work on all summer.

#### EXPERIMENTING WITH HONEY-PLANTS.

I have been experimenting some on several kinds of plants that have been recommended for bees, and I will tell you the result:

1. White clover is a good honey-plant, and the honey is of good quality; but I think there are several plants that will yield more honey to the acre.

2. Alsike clover. From what I have seen of alsike I do not think it as good a honey-plant here as white clover.

3. Red clover. I have never known bees to gather much honey from red clover in this country, not even the Italians, except in one instance, when the blossoms were filled so full of honey that the blacks worked freely on it; it was the first crop too.

4. Sweet clover; blue, or bee clover. I have tested this, and the bees did not work much on it, and it stayed in blossom but a short time.

5. Sweet clover, white. Bees work on it considerably part of the time, but it does not seem to yield a very large quantity of honey.

6. Bokhara clover, white, is a little different from white sweet clover, and blossoms about 10 days earlier, but yields about the same quantity of honey, and keeps in blossom about the same length of time — about six weeks here.

7. Sweet clover, yellow. I sent to you 2 years ago for some seed of this variety, and you had some sent to me from "Plant Seed Company," St. Louis, Mo.; but the seed was not genuine. After it came up it

spread all over the ground, and blossomed the first season; it had very small yellow blossoms, and was no account for bees. I think it must have been yellow trefoil. Then I threw the remainder of the seed away in a waste place among some trees, where it came up, and there were three or four plants of the genuine yellow sweet clover came up among the rest, which I did not notice until the next season, when it blossomed; but being in the shade, the seed dropped off before it ripened. From what I see of it, I think it is a better honey-plant than the white. The blossoms are larger and more fragrant, and it blossoms about 2 weeks earlier. I should like to get some of the seed. If you know of any one who has the genuine yellow sweet-clover seed to sell, please inform me.

8. Sainfoin. This has not proved to be of much account for bees.

9. Scarlet clover. The bees did not work on this at all.

10. Catnip. Good for white-faced bumble-bees, but not for honey-bees.

11. Phacelia. The bumble-bees seemed very fond of it, but the honey-bees did not notice it at all.

12. Hoarhound. Bees work well on it, but the honey has a bitter taste.

13. Motherwort. Bees work considerably on it, more than they do on catnip, but not as much as they do on hoarhound.

14. Buckwheat is not of much value as a honey-plant in this country. Oftentimes they will scarcely notice it at all, and I have never known it to yield large quantities of honey here as it did in Wisconsin, where I used to live.

15. Sunflower. Bees very seldom work much on them here.

16. Borage is a good honey-plant. When it does well it will yield the most honey to the acre of any plant that I have tried; but it needs careful cultivation to give the best results. Its only fault seems to be in shedding its blossoms too quickly in dry hot weather, or when not properly cultivated. It blossoms in about 2 months after sowing, and continues in bloom 2 months or over. It will live through the winter when sown late, and blossom early in the spring. By planting three times during the season, it can be kept in blossom from the middle of April until the middle of November; it is also a good herb; and drinking the tea made of the leaves or flowers will keep any one in a healthy condition.

17. Blue thistle. I sowed some of the seed this spring. It came up, and has formed large spreading plants, but does not seem inclined to blossom the first season. It looks as if it might furnish an abundance of blossoms next season. It is about the same nature as borage, but does not require as careful cultivation. I have no doubt it will be a good honey-plant, if the blossoms yield honey equal to borage-blossoms.

18. Mustard. Bees work pretty well on mustard, and seem to gather quite large quantities, both of honey and pollen, but it does not yield as much honey to the same ground as borage.

19. Rape. Bees work some on rape, but it does not seem to be nearly equal to borage as a honey-producing plant, and keeps in blossom only 3 weeks here.

20. Evergreen-blackberry is a good honey-plant; it keeps in blossom over 2 months, and yields large quantities of honey, but not much pollen; bees work on it continually "from early morn till dewy eve,"

and it yields much more honey than any other of the berry tribe.

21. Raspberry. Bees work considerably on both the red and black varieties, but neither of them yield anywhere near as much honey as the evergreen-blackberry: the common blackberry does not either.

22. Mignonnette. Bees seem to be very fond of mignonnette, but I do not know exactly how large a quantity of honey it yields. I think the yellow variety is the best and prettiest.

23. Dandelion. Bees almost always work on them; they yield some honey and some pollen, but they do not appear to yield a very large quantity of honey to the acre, and I do not like the flavor of the honey either.

24. Alfalfa. Bees do not often work much on it here.

25. Sage. The common sage is a pretty good honey-plant here, and yields quite a large quantity of honey.

I am taking GLEANINGS. This is my first year, which will expire with the December number. I like it first rate, and the principles which it advocates; for I believe in God and the Holy Bible, and shall try to live according to its teachings. I do not swear, neither do I use that filthy weed tobacco, nor get drunk with intoxicating liquors, and I heartily indorse your efforts to persuade people to live Christian lives, and leave off the disgusting habit of using tobacco, and deal squarely with their fellow-men. I also admire your efforts to advance the bee-keeping industry. I have not kept bees since I came to Oregon, with the exception of one swarm, until this season. I used to have some in Wisconsin, before I was grown up. I now have 14 swarms. I hunted wild bees a while this summer. I found 7 bee-trees, and succeeded in saving 4 of the swarms. When their nests are near the top of the tall fir-trees, they generally smash up so as to kill most of the bees. I cut one in which the nest was about 150 ft. from the ground.

I have bought 80 acres of land, 26 miles from Portland, which I intend to convert into a honey-farm, for I intend before long to make a business of keeping bees, as it is my natural occupation. I do not intend to raise bees and queens for sale, but only for honey. The land that I have bought is pink with elkweed when it is in blossom, but I shall burn it over next season, and seed it with something that will make better honey. Elkweed honey looks pretty well, but the flavor is not very good. I want to sow the kind that will yield the most good honey to the acre, and make a handsome flower-garden too; for I am very fond of flowers, so I have concluded to sow and plant the following kinds, which I think will repay cultivation for honey alone:

FRIEND WARREN'S CHOICE OUT OF 25 HONEY-PLANTS.

Borage, yellow mignonnette, blue thistle, evergreen-blackberry, yellow sweet clover, red sage. I shall also sow thyme and yellow sweet sultan in my garden, but I do not know that they are of any value as honey-plants, for I have not tested them.

I love the fragrant flowers, I love the humming bee;  
I love the pleasant summer, when birds and bees are free.  
I love the pleasant sunshine, I love the shady wood;  
I love the true and gentle, I love the kind and good.

MORRELL E. WARREN.

Portland, Mult. Co., Oregon, Nov. 27, 1882.

Friend W., when I first looked at your letter I was tempted to think it too long;

but after getting into your reports of honey-plants I thought it about right. I confess I was a little disappointed when I found you had but one hive, but I afterward reflected that you could tell much better about the quality of the honey from a limited area of plants, with one hive, or only a few, than you could with a whole apiary. If I had only one hive of bees, and no more within several miles, I could tell you about the quality of figwort and spider-plant honey, and the amount of honey they would yield per acre, and many other things, which I find quite out of the question with hundreds of stocks about me. Go on with your honey-farm, friend W., and let us hear how it comes out. Thanks for the little poem.

SEX OF BEE OVA.

SOMETHING MORE FROM THE FRIEND WHO WROTE ON P. 125, MARCH, 1882.

I HAVE read with marked attention the way in which my opinions have been received by you and American bee-keepers generally, and a year has almost glided past since I wrote the brief article on the heading of this letter, and I still have cause to hold on to the opinion I then expressed; viz., That, by the treatment to which the bees subjected the ova, they could produce male or female from the same egg. I then started the hypothesis, that the egg of a fertilized queen was "neutral"; but since then I have found myself in a quandary; for although I found male and female produced from worker eggs, every time I have tried to raise queens from drone eggs I have failed. I have placed them in newly raised queen-cells, and they disappeared without leaving a trace behind. I have given queenless hives small squares of drone eggs, and when I was about to reach the supposed goal, in eight or ten days every cell was torn down, and here I am still without a solution. I have tried hard to think that the cell was the sole cause of failure, arguing that a drone-cell would give a small formation to queens, and the season was too far advanced for my fully testing this, although the disappearance of the male egg from the queen-cell half answers this.

Then I have seen the theory you propound, of the "bees removing sperm from egg," and it is quite possible you may be right. Could not this be tested by those who have good microscopes?

You ask me if I noted what the eggs hatched out which I saw bees dropping into cells. I can not answer. It was on worker comb, and I did not think the queen was over healthy, her wings having assumed a rusty-like appearance. I superseded her and sent all to the hills, not having thought of the act as uncommon.

Now, right here permit me one question: Have you not observed, when a queen is put into a hive, it may be for the first time, or on returning her after a brief absence, the manner in which she is examined? Do not the bees examine her as if expecting her to drop eggs?

With reference to bee moving eggs from one cell to another during the spring months, one of my hives became queenless; from what cause I could not explain. Only one or two frames had eggs in them. Although the swarm was quite a small one,

my first cause of suspicion of an absent queen was the eggs appearing in drone-cells. The same thing was noted by Mr. Charles Carnegie, Marykirk, as occurring in a queenless hive. Now, I find you say, that, in the case of drones and queens raised from the same eggs, the drone would not be of sufficient age for mating queen. This I can not quite understand; since drones will hatch eight days after the queen, then there would be thirteen days for the drones to be on the wing before the 21 days which are given to queens for mating. I find you will have to send me an A B C book, for I can not suppose that they would require more than a week to take an airing.

K. EDWARD.

Montrose, Scotland, Dec., 1882.

Friend E., a drone egg can not produce a queen, nor any thing like it. This has been for years well established. In some few cases a drone has hatched out from such a queen-cell, but he was just like any other drone. A drone egg can not produce a queen or a worker; but the point you made, that a worker egg may, by some means known to the worker bees, be made to produce a drone, may be true. I do not think that either the microscopes or the microscopists of the present age are equal to the task of helping us much in the matter.—I have seen the workers thus examine a queen just given them, and I have also seen queens extrude eggs which were greedily taken by the bees; but I never knew what they did with them.—As you state it, I confess it seems possible that drones may be old enough to fertilize a queen when the eggs for both were laid on the same day. A queen may be fertilized when 21 or more days old, but they are usually laying at 10 or 12 days.

### RAISING QUEENS, WITH A LAYING QUEEN IN THE HIVE.

HOW FAR ARE WE ABLE TO DO IT?

SEE that Mr. Alley is about to give, in a book, his method of raising queens in full colonies with laying queens. I am glad of it. I expect to learn some profitable lesson from him. But before his book appears I desire to give, through GLEANINGS, what little I have learned on that subject.

While extracting honey I first noticed, that, when combs containing incipient queen-cells, with eggs or larvae, were given to other colonies, that these cells were not destroyed, but completed. From this I took a hint last summer, and in a few instances gave cells just started, to some strong colony, putting the comb containing the cells into the upper stories, or some part of the hive not frequented by the queen. In this way I succeeded in getting young queens raised in hives containing laying queens. The colonies I selected to raise these queens were the strongest I had.

My experience is limited to a few trials, but it is enough to assure me that the method is practicable. I think it would be an advantage to shut the queen off from the part of the hive in which these cells are placed. I removed the cells a few days before the young queen emerged. If left to hatch in the hive, it might be necessary to protect the cells by cages placed over them. If the lower part of the hive is used, the queen could be shut out of the side

the cells are in, by a division-board. If the upper story is used, a perforated zinc could be used to keep the queen from ascending. In the few experiments I made, I did not shut the queen off.

These incipient cells could be arranged in rows on the edge of a comb. If Mr. Alley has some method of getting these cells started as well as completed in these full colonies with laying queens, then he has achieved what I have never tried to do.

Milroy, Pa., Dec. 18, 1882.

J. W. WHITE.

On p. 12 we have an article on the same matter; and below we have something that pretty well supplements what you have given us, friend W.

HOW TO GET QUEEN-CELLS WHERE YOU WANT THEM.

The best way to graft for queen-rearing is to shave the comb down as close as possible, without cutting the eggs. Cut off the bottom of the queen-cup, and set it over an egg; press slightly into the comb; then, if properly done, you have an egg in the cup just in its natural position. If you make the cups by molding, make them cone-shaped, then cut off the apex. You can stick on as many as you wish queen-cells.

F. DELLA TORRE.

Baltimore, Md., Dec. 19, 1882.

Friend D., may I ask if you have practiced this enough to feel sure it is practicable? Perhaps some of the friends have forgotten that this is an old subject. The following is an extract from GLEANINGS, 1878, p. 323:

Well, now, you see we will just take a comb-guide and fasten little knobs of wood along the edge like this (Fig. 1):—

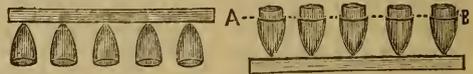

Fig. 2.

Fig. 1.

#### ARTIFICIAL QUEEN-CELLS.

The pointed pieces of wood may have a pin point in their lower ends, that will hold them to the comb-guide until the whole machine is immersed in melted wax up to the line A B; take it out, remove the sticks, and you have a string of queen-cells like Fig. 2. Take these to your best imported stock and put small larvae into each cell; hang it in a queenless and broodless hive, and I will warrant a string of nice queen-cells, nicely capped over in due time. If we have a powerful colony, several such sticks may be used; for a full stock can supply as many as fifty cells with food all at once, and in the height of the season it may be even more. Nice queen-cells to order, strung on a stick, for 10 cts. per dozen, sent by mail, postpaid!

### FRIEND HEDDON AND HIS APIARY.

WHAT THEY THINK OF HIM AT HOME.

WE extract the following from an article in the *Republican*, Dowagiac, Michigan:—

One of the most important business interests in this city is Heddon's apiary and bee-keepers' supply manufactory. The proprietor of this institution, Mr. Heddon, began bee-keeping as a specialty in 1869, and was the first specialist in Michigan, there being but few in this country at that time. His capital stock did not exceed \$500, but the business has increased steadily since, giving him a nice profit, which Mr. Heddon has for the most part kept in the business. He has owned at one time as many as three apiaries and 550 colonies of bees, having now 400 colonies in his apiary in this city. He has always produced both comb and extracted honey, formerly giving preference to the latter, but of late years producing mostly comb. The wholesale prices have ranged from 12½ to 25 cents for comb, and 10 to 18 cents for extracted. His honey has always been put up in better style than any other producer in the U. S. The following is from the largest honey dealer in the West:—

Your honey is put up the nicest of any we have seen, and is going off at wholesale at 25 cents, faster than we anticipated. R. A. BURNETT.

165 South Water St., Chicago.

He sold D. D. Malloy & Co., of Detroit, \$1167 worth at one shipment, all put up in glass jars, and packed one and two dozen in cases.

#### THE LARGEST YIELD OF HONEY

From one hive was 410 lbs. during one season. The largest yield from one hive in one day was 29½ lbs. This was extracted honey, except about 50 lbs. of the 410. These figures only show what can be done, with all conditions the most favorable. With so many bees as he now keeps together in one area (an area, or bee-range, consists of a field whose diameter is 6 to 8 miles), the pro-rata yield is quite small. Where nothing was gathered before, he has gathered together and sold something over \$20,000 worth of this produce during the last 13 years.

Mr. Heddon has formerly given employment to one or two hands during 8 months of the year, and he now employs three or four during the summer season, and one all the year around. This year's crop of honey was some over half comb, the bulk of which was sold to Colter & Co., of Cincinnati, they sending \$720 for 4000 pounds, the price being 18 cents per pound here, cash in advance. He still has some 3600 pounds of extracted honey now on hand (candied solid) which he is keeping to fill orders for regular customers who depend upon him from year to year, and the home trade.

He sent a 200-lb. cask to Karl Rudd, Sheldon, D. T., a few weeks ago.

#### EXTRACTED HONEY

Is gaining ascendancy in demand over comb honey every year, and the favorite way of handling it is in the candied state, as that condition is positive proof of purity, and not only prevents all daub and leakage, but can be retailed in more useful packages, and gives the purchaser a choice of consuming it in the candied state (one much preferred by many), or in the original liquid state, as exposure to 180° Fah. of heat, brings it back to former conditions, the color and flavor remaining the same.

His apary fixtures having grown into demand more and more every year, he is now manufacturing and dealing in

#### BEE-KEEPERS' SUPPLIES,

Buying his lumber here, and doing his machine work at our sash factories. This year's sales foot up to a little over \$3000.

### COMB HONEY; COVERINGS FOR THE FRAMES, ETC.

#### ONE-POUND SECTIONS.

**I** HAVE a good many inquiries lately; and if the friends will be patient I will try to answer them through the columns intended for mutual interchange of thought.

I don't know whether I can get as much honey in 1-lb. as 2-lb. sections; for since discarding 6 to 10 lb. boxes, I have never used any thing but the 1-lb. section. I think it likely, however, I might get more in 2 lbs., but the 1 lbs. sell better; and moreover, all my fixtures are arranged for 1 lbs., and I should not want the bother of changing, without seeing a very plain prospect of gain. I am old fogy enough to prefer do-retailed sections.

#### SEPARATORS.

So long as I raised honey only for a home market I did well without separators; but to pack the sections in cases for shipping, I found separators a necessity. I wish I could do without them. They give a section a clean look, and a section raised without separators looks so full and plump. Get one of A. I. Root's catalogues, and you will find full description and illustration of the frame and separator I use; the separator being 3½ inches wide. By looking at the illustration you will see that no bee can get on the outside of the sections. Before buying any more tin for separators I think I shall

try wood 1-12 to ¼ inch thick. I was much interested in Mr. Hasty's experiments, and thank him for saving me the trouble of trying linseed oil; but the thing that I should have the most confidence in is propolis.

#### QUILTS.

May be they ought to be called sheets, for that's about what mine are. I have tried nearly every thing, except woolen cloth and wooden slats. For a time I was better pleased with enameled cloth than any thing else, and have used, I think, over 150 of them; but I don't think I shall ever get any more. If the bees get at the wrong side of them, the cloth is very soon all gnawed away, leaving merely the enamel, which is without strength. The bees seem to gnaw them much worse than they do ordinary cotton cloth. Then, too, as they get old the enameled sheets become hard and brittle, and easily tear to pieces. I have been a little puzzled to notice a great difference in the lasting of the same material at different times. Some thin cotton cloth that I got by mistake seemed to last as long, or longer, than heavy duck cloth. I think the difference is largely owing to the time of year when the sheet is first put on. If a sheet of new cotton cloth is first put on in early spring, or after the honey harvest is over in the fall, I think the bees will test its strength pretty thoroughly; but they will leave whole and cover over with bee-glue that which is put on in the working season, perhaps because they are too busy to gnaw it, or because propolis is plenty to cover it. After it is once well coated with propolis all over, it will last for years. All in all, I think the best sheets I have ever used are the first I made when cloth sheets were first introduced. That was years ago, and some of them are in use yet. They were made after this fashion: Good cotton cloth was used, a piece cut twice the proper size for a quilt, or something larger, to allow for shrinkage; the piece was doubled over, and two sides sewed together. This makes a sort of bag, which is turned inside out, and a newspaper or two put into it. If such a quilt is put on when the bees are busily at work it will last a long time. I have sometimes thought the newspaper, besides making it very warm, helped to keep the bees from gnawing the cloth. I have known in more than one instance a hole to be gnawed into the cloth, and one or two thicknesses of the paper gnawed through, then cloth and paper both well glued over by the bees, and not disturbed afterward.

In cleaning up supers, frames, and sections, each year, several pounds of propolis are collected. I have thought of taking this and melting it in a boiler or dripping-pan, then dipping in new cotton sheets, and I don't see why the bees would not respect them as well as if coated by themselves.

C. C. MILLER, 174 — 202.

Marengo, Ill., Dec. 23, 1882.

Very good, friend Miller; but do you know that propolis will melt like wax, so a cloth can be dipped in it? Another thing: Why should the enameled sheets ever be put over the bees cloth side down? or, rather, why should bees ever have access to the cloth side? It is the only thing we have ever seen that could be kept clear of propolis. I, too, should be very glad to dispense with separators, but I do not at present see how it can be done. After your wooden separators are used a few times, I think you will find that the bees are pretty apt to stick bits of comb to them.

## LAYING WORKERS AMONG THE CYPRIANS AND HOLY-LANDS.

### DRONES FROM WORKER EGGS, AGAIN.

ON the 11th of last July I shook a full stock of Cyprian bees into a nucleus hive, destroyed their queen, and gave them two solid Langstroth frames of honey, and one frame from which the honey had been extracted, inserting a strip of comb containing eggs from my breeding queen in the empty frame. This was in the afternoon. Their queen was a year old. The next day I examined them and found but two or three queen-cells started—poor ones at that. I also found that these bees that had never been queenless in their lives were laying eggs plentifully, filling all the empty cells in the inserted strip, and in some cases putting eggs in cells already filled by the queen. The next day matters were worse—many cells were half full of eggs, and even the queen-cells were covered over the bottom with eggs, and new cells were started on the comb at the right of the strip of eggs given them. These I carefully removed, and destroyed the eggs near by. By my daily examinations I prevented any cells being nursed outside of the strip given them. But the workers continued laying until they had a strip 11½ inches long instead of 5½ inches, as at first. When the queen-cells and brood were finally sealed over, there was rarely a worker cell to be seen, and the others produced drones, for I saw them hatching. But as soon as they had these drones sealed over they seemed to be satisfied, and ceased to lay. Having no confidence in their queen-cells, I removed them and gave them a ripe cell from another stock prepared in the same manner the same day. The queen hatched, but never became fertile.

When I thought it useless to keep her longer I killed her and gave them another cell. The workers destroyed this cell and commenced laying again. They destroyed another and another, until I had no more to give them, and they were left hopelessly queenless. In a few more days a neighbor came walking up to where I was working among the bees, with an old queen between his thumb and finger. I had been wishing for a queen; so I clipped her wings and dropped her into this hive, without any ceremony. They accepted her and again quit laying, and were soon full of sealed brood. I killed her then, as she bore the name of producing cross bees, and gave them a cell. This hatched, but failed to become fertile. Fearing she would never become so I killed her also, and caged a laying queen among them. By morning the workers were laying again as badly as ever, and continued to lay till cold weather, but finally ceased altogether, and are now a good stock, the bees mostly the progeny of the last queen.

At another time, Sept. 13, I destroyed three queens; one a laying queen two months old, one just fertilized that day, the third a virgin. This was in the evening. Early next morning, only twelve hours afterward, the strips of eggs given them for queen-rearing were so filled with eggs by the workers as to be utterly useless. An old bee-keeper, who was present when I made these stocks queenless, and also at the examination in the morning, declared he would not have believed this, if he had only heard of and not seen it. And I hope the friends, and especially those who think that drones can be raised from worker eggs, will not think I am

making an unwarrantable assertion when I claim, that laying workers may appear in a few hours after the stock has been made queenless, no matter what its previous condition has been, and that they may lay for a short time only, and cease when they have a supply of drones. In close connection with this I want to assume, without taking space to prove it, that the eggs and larvæ in strips of comb inserted for queen-rearing are many times missing shortly afterward. On page 604, Dec. No., Chas. Kingsley says such is repeatedly the case, and you certify to it.

Now for the "more yet" that friend Roe is ready to hear. On page 536, Nov. No., he says: "I gave a frame of eggs and brood from another colony, all worker comb, on which they started several queen-cells, capped about 50 cells as drones, and the rest as workers. The drone-cells were scattered broadcast over the comb." On page 605, Dec. No., he says, speaking of the same experiment, "I saw some of the drones crawl out of the cells, and examination proved the others to contain drones also." I don't doubt a word that Mr. Roe says, but he doesn't say enough. Experiments, to be valuable and conclusive, must not be fragmentary. Before he can claim to have proven that a queen's eggs can be changed from worker eggs so as to hatch drones, he must first state positively, from a careful examination, that those fifty cells were every one occupied by an egg at the time he inserted the comb. If they are not occupied at that time, the natural inference is, that they are supplied by laying workers. If they do contain eggs when he inserts the comb, he must state, from frequent examinations, that they or their larvæ do not at any time disappear, that these same 50 cells were at no time duplicated by the workers, and the original destroyed. Then, if drones come forth, he has a strong case.

I will now indicate what I think will be necessary to prove, that the workers can change the sex of eggs. First, a long strip must be taken from a comb of worker-cells, every one of which is occupied by an egg or larva. Secondly, the experimenter must be very careful to know that every cell is continuously occupied by the original product. Thirdly, they must be seen to hatch drones. Fourthly, they must be of the same race as the queen, but of a different race from the bees among which they hatch. And finally, no drones must appear on the remainder of the comb left with the queen. Whoever narrates an experiment fulfilling all these conditions will have good reasons for claiming that the workers can change the sex of a queen's egg. In future communications on this subject, it is to be hoped that the brethren will give full details, as this is what gives a scientific value to observations and experiments.

J. S. HUGHES.

Mt. Zion, Ill., Dec. 18, 1882.

Seems to me you are drawing the lines a little too close, friend H. If we put a frame of worker eggs, laid by an Italian queen, into a queenless colony of blacks, and find that it hatches Italian drones, is not that enough? Of course, we want to show that the eggs would not have produced drones, if left undisturbed in the parent hive; but if the eggs were laid by a queen only a month or two old, would not that fix that part? I know how prone the "Cyps" are to have laying workers, but such drones *must* hatch later. Don't you see?

## MAKING THE BEES WEAR SHIRTS.

ANOTHER OF FRIEND HASTY'S FANCIES.

**H**AVEN'T they been without any thing on long enough? Dark ages indeed, when our pets have to go naked! "I don't like to associate with men who haven't any shirts," said an African savage, in making a little speech to the missionaries. They had recently taught him to wear the garment in question. And, friend Root, if a lot of your high-toned Italians should take a notion to come, and visit my black and hybrid aristocrats, how it would take them aback to have the proud natives aforesaid turn up their little honey-snouts and say, "We don't like to associate with bees that haven't any shirts."

On the whole, I might as well confess that I have not got as far yet as to make each individual bee wear a shirt; but the colony in its collective capacity wears one. The shirt is a substitute for the upper story of the hive. It is a recent invention of mine, but I am so very much pleased with it that I think it has come to stay clear to the end of the show. You remember that the elder Grimm was very emphatic about having the covers of the hive raised during a yield of honey, asserting that he got a great deal more honey by so doing. Well, raised covers are liable to let a storm beat in sometimes, and liable to be neglected until robbing breaks out, I should say. And I'll warrant that nine-tenths of us neglect to raise the covers at all, and so lose whatever is to be lost in that way, probably a large amount. Perfect super ventilation is assured by using a shirt instead of an upper story to cover the sections; and no evil results follow, as far as I see yet. Just lay across the brood-frames two quarter-inch strips, and set on the sections, either in brood frames, racks, or in any other way imaginable. Whether the super fixings are of a size to fit that particular hive or not, doesn't make a "dit o' bifference;" the neat muslin shirt, like charity, covers all. A roof, surmounted by a good-sized stone, is to be placed on top of all, of course. In making the first trials I wondered whether the bees would eat holes in the muslin, or propolize it. They never do either one. Where the fabric is pressed directly upon some chink close to where they are working, they propolize, but do not make holes. Before putting on the shirt I take care that the sections are sufficiently sided up with something, that no very large holes exist; and this, with what restraint is put upon the air by filtering it through a thickness of muslin, seems to be just inclosure enough.

I am aware that one might reason in this way: Letting air more directly into the sections will cool them; and if cooler, the scales of wax will not be workable, and comb-building will stop. But all theoretical points have to go by the board when actual practice contradicts them. Comb can be built when the air immediately surrounding the cluster is quite cool. Of course, a novelty must undergo a longer test (and a more general one) than this has had before being accepted by the fraternity at large.

Now as to the way of making and putting on the garment. Permit me to give the way I intend to put them on next season, instead of the way I put them on last season. Get the cheapest muslin, costing about 6¼ cents a yard. There is a kind which is tolerably heavy, but freckled with brown spots, which is most desirable if you can find it. With the aid of

a sewing-machine make the material up into large tubes somewhat like shirt-bodies. Let the width of each be a little more than enough to go around your largest super, and the height several inches more than the height of the supers, when tiered up as high as you expect to tier them. You want now some thin wooden strips. If none are at hand, rip up some lath on the foot-power saw, making strips say ¼ inch thick. Take four pieces, the same length as the four sides of your hive, and with a few wire nails and the strips fasten the lower end of the cloth tube, or shirt, securely over the top edge of the lower story. In use, the surplus length of the shirt is to be folded over the top of the super, and held there by the weight of the roof. When desirable to look in, just take off the roof and let the upper end of the shirt drop down.

Besides the main advantage hoped for, of increasing the honey crop, the sections are easier to get at than in many upper-story arrangements. You can also adopt any new and desirable thing in supers or sections that comes along, without changing your hive. By means of this device I intend next season to put pound sections on a good many hives that were made for 1½-pound sections—the demand for the smaller size being so much the greater.

As to the durability of muslin exposed to the weather, I have had a pretty good illustration. In the fall of 1879 I made some saw-dust cushions directly upon the outside of the hives. I didn't think them of much use, but have left some of them on ever since, to test the weathering qualities of cotton. I believe none of them have given way, except where something was banked up against them at the bottom, in such a way as to hold wet.

It just seems to me that I can catch a good glimpse of the coming hive. A bottom, smooth on one side for summer, and made into a sawdust tray on the other side for winter. A one-story chaff-packed body, sized to suit one's frame, and wide enough to cut all the capers that come along inside of it. A flat roof, chaff-packed also, and clad with a big sheet of tin; a light narrow rim to inclose the folded cushion of chaff in winter, and a shirt to cover the supers in summer.

### CRITICISING.

It is changing the subject a good way, but it's a matter I've been thinking of, of late—the way we junior class of bee-folks have of pitching into friend Heddon and friend Doolittle, and other seniors whenever our experience does not just tally with theirs. It must seem to them at times that this is a rather hostile world. Now, we don't mean it in that way. We are just as proud of them as need to be, all the time. They are suffering from "that fierce light that beats about a throne." Perhaps, however, we would seem a little less like a troop of boys throwing half-bricks, if we should contrive to say a kindly word now and then. To practice as well as preach, I have been much pleased by the quality of the plants I got from friend Doolittle; much larger and nicer ones than those obtained from a leading nurseryman of high repute.

### LAST MONTH'S QUESTIONS.

I was too nearly out of thin foundation to spare enough to fill a super with full-sized pieces when I tried the sections without separators. Remember, I did not give my experience as an exhaustive set of experiments, but only as a series of dodges to get out of a corner. I have, however, repeatedly had bees work on one side of the foundation in a section

until it was curled around almost far enough to touch the tin. The result in case no tin was there might easily be imagined. Besides, our customers will eventually get sharp enough to object to honey built on foundation. Natural comb is almost invisible when bathed in white honey; but the bright yellow of thin foundation is far too conspicuous to look nice, when cut on the tea-table. Foundation has also an unpleasant taste of its own, different from virgin wax. This taste is easily detected in the honey, when once one's attention is called to it.

E. E. HASTY.

Richards, Lucas Co., O., Dec. 13, 1882.

Why, friend H., you are going back to old matters that have been dropped and settled. Nobody nowadays sees any difference between natural honey and that built on fdn. I am afraid your "shirts" won't look well, will they? Won't they look "shift"-less.

### MARKETING HONEY.

HOW OUR FRIEND DAN WHITE DOES IT.

**F**RIEND ROOT wants to know where I put so much honey, and asks several questions, which I will answer after telling my success getting customers to buy honey. The first season I got any quantity of extracted honey, the trouble seemed to be to sell it, although I offered it at 10 cents a pound, and a first-class article of thick ripe honey too. Nearly everybody would say, "I should like some comb honey, but don't like strained honey." It seemed to be the general opinion, that I had come the Yankee on it by adulterating it with something; at least they were afraid of the stuff. But I had the honey, and it must be sold some way; and when out with horses and wagon, sometimes ten miles from home, I would stop at every house and make a sale if possible, even if not more than one pound. If this could not be done, which was frequently the case, they would not object to my filling a saucer and giving them some, which I would not fail to do. Well, I overdid the business; for long after the honey was all gone they kept on coming from far and near with pails and crocks after more of that *dreadful* strained honey. You know we all have more or less friends and company come a visiting, and I believe this caused me to overdo the business. So you see honey seems to agree with visitors; and if there is any in the house they get a lick at it. They would, of course, say, "What beautiful honey!" "Where did you get it?" "What did it cost?"

"Got it of Dan White for ten cents a pound."

"Well, I do declare! I will send Joshua after two or three dollars' worth to-morrow;" and if Joshua bolted, as I often think he did, Jane Ann would hitch the old mare to the buggy and come herself. Lots of "Jane Anns" came this season when I was extracting; and when I assisted them out of the carriage, I would almost stick fast to them, and nothing could amuse me more than to see them eat cappings. They would go away "too sweet to mention."

My this season's crop of 8000 lbs. of extracted honey was disposed of as follows: shipped to friend Root and others by rail, 1100 lbs.; sold, to put in grocery stores to retail, 600 lbs.; sent a man on the road 6 days, and he disposed of 1880 lbs.; 3420 lbs. has been taken away by customers who came to the

door after it, with the exception of probably 500 lbs. which I received orders for, and delivered, mostly in the village. I got 11 cents a pound for all except 50-pound lots and upward, which brought 10 cents; and I now have on hand, at a low estimate, 1000 lbs. in L. frames, laid away to feed, if needed, next spring.

I don't propose to be caught as I was last spring with hives running over with bees, and nothing to feed them except sugar. I bought and fed daily, as you would sheep and cattle. Last spring, when white clover first gave honey, I actually believe there was not 100 lbs. of sweet in my whole 80 colonies.

Now, if I would add to my other report 30 lbs. to each colony left for wintering, 120 colonies would show that my 80 colonies made not far from 11,600 pounds.

I weighed what I extracted from one of my strongest working colonies; it gave 213 lbs., and I think I had several that did equally well. The 400 lbs. of comb honey (my share of the 10 colonies), I took charge of away from home; sold for 18 cents a pound, all but about 80 lbs; that, Julia took charge of. Come and see us, and I presume you will see a chunk of it on the table—extracted too; take your choice. The forty 4-frame nuclei brought \$4.00 each; the fifty-two 3-frame nuclei \$3.00 each; 57 queens brought me \$62.00.

Now I have gone on and told you all about the honey on hand laid away for the bees, so I will say I have two dogs, and they will bark!

New London, O., Dec. 11, 1882. DAN WHITE.

Many thanks, friend W., for standing up and "speaking your little piece" so well; but you did not tell us who "Julia" was. We know Daisy and Bertha; is she any relation to them? And is she a "bee-woman"? I believe heartily in your plan of working up a home market.

### DOOLITTLE'S NEIGHBORHOOD.

BY ONE OF HIS NEIGHBORS.

**I** COMMENCED keeping bees in 1878, with three colonies; in 1881 my spring count was 7 colonies; one of them had about one gill of bees, and one queenless. I doubled the two, which made me 6 colonies, and not very strong; increased to 13; made and sold 1100 lbs.; went into winter quarters with 13 colonies; spring count, 1882, 13 colonies; lost none through the winter. The season of 1882, up to July 4, was very poor, for at that date starvation was upon them. On the 10th of July they went to work and found sustenance enough to feed themselves until the 18th, when basswood came into bloom, and from that date for 16 days they made 1310 lbs., which I sold, and increased my stock to 25 colonies, with which I go into winter quarters, with an abundance to winter upon. The season has been to me all that I could ask for. I reside about 2½ miles from G. M. Doolittle, and with the same production for honey range, and I can not agree with him that this has been a poor year, or that the basswood product lasted for only 7 days; for with me it lasted 16 days, and from that source I made all of my honey (despite what A. A. Fradenburg may say in the premises). There are others in this section who make bee-keeping pay, Mr. Editor, equally as well as Mr. Doolittle, and have just as good stock, etc., as he has; but when our favorite basswood, to

which we owe our success, is belittled, as to its honey-producing qualities, and the idea is advanced that it is the man that makes the success, it is time that some of his neighbors, who do not aspire to newspaper notoriety, and who say God speed bee culture, have a word to say in the matter.

If I mistake not, you will receive more communications from this section, and from those who are satisfied that the year 1882 was one of productiveness, and to them all that could be asked for. My statement here sent is true, and can be vouched for in every particular.

HENRY WIRTH.

Borodino, N. Y., Dec. 9, 1882.

Gently, friend W. We are very glad to have you speak out, and even enter your protest against its being called a poor season; but for all that, I think you hardly take in consideration that friend D. speaks comparatively, when he called the season a poor one. You call a hundred lbs. to a colony a good season; well, I guess the most of us do too; but there are a great many now who go far beyond that with a few colonies, as you have.—In regard to superior strains of bees, I am inclined to think Italians in one apiary will gather about as much as the Italians in another, other things being equal. Many of the reports of late would seem to indicate that a dash of black blood might, if any thing, make them do a little better, especially on comb honey.

## HOW TO PRESERVE OUR BEE JOURNALS.

### HOME-MADE BOOK-BINDING.

I HAVE not seen any good, easy, cheap, and durable way published yet, telling us how to bind our journals to preserve them, unless we get a binder. Friend Hasty recommends a paper of wire nails and a hammer; but I fail to see the preserving influence he claims in the nails and hammer, but I do not dispute his seeing it. I have bound GLEANINGS for 4 years, and I will give the plan. I have a thin board, cut just  $9\frac{1}{2}$  inches long and  $6\frac{1}{4}$  in. wide. On one side, just  $\frac{1}{2}$  in. from each end, a small notch is cut, and another in the center between the two. To use this board I take a copy of GLEANINGS, open it in the middle, right side up on a board or bench; place the board on the right-hand half of the copy, with the notched side to the center, and with the upper notch just even with the line above the reading-matter; then with an awl I make a mark at each notch in the board; remove the board and punch a hole through the leaves at each notch, being sure to punch where the leaves fold. I then put a pin through each outside hole, shut up the copy with the front cover up, and put on the board just as I did before, with each outside notch even with the pins, and the edge of the board even with the back of the copy; then with a sharp knife I trim the copy even with the board all around. I then make 3 good strong strings about 6 in. long, from good flax shoe-thread, and loops from the same. To make the loops I first make a long string, then I drive two 1-inch wire nails into the edge of a board just  $7\frac{1}{2}$  in. apart. I wrap one end of the string around both once, and tie, cut it off, and repeat as many times as I have copies to bind. Now, to bind I take the Jan. number, open it in the middle, right side up, and with a crochet needle I draw a loop through the up-

per hole from the *inside*; tie one of the short strings fast to it, and draw it back; draw the other end of the loop through the lower hole, and tie another short string to it, and draw it back; draw the other short string through the middle hole from the *outside* over the loop-string; back and tie. I then lay the copy with front cover down, with the strings to my right; take up the Feb. number, and proceed as before, only I draw the short strings through the loop without tying. I keep the short strings drawn as tightly as their strength will admit; and when all are done I draw the strings all tight and fasten the ends. The strings must be very strong, and well twisted, more especially the short ones, and the short ones should be 4-ply; the loops 2-ply. If covers are desired, the short strings must be left an inch or two long on each side, to hold them; this may be done by untwisting the string and pasting it on the inside of the cover, and pasting a sheet of paper over them to hold them firmly. I put covers on Vol. VII. of GLEANINGS, but put none on the other three. I aim to take good care of them, and by so doing they do not necessarily need covers. I have the volumes indexed to suit my own fancy; and by this index I can turn to and read up all that has been published on a great number of the main questions, such as wintering, ventilation, candy for queen-cages, etc. on short notice. I should have said, in the proper place, that the copies can be bound and trimmed afterward, just as well as to trim them separately, but I have followed the plan given above.

New Point, Ind., Dec. 11, 1882.

T. J. COOK.

The above, if I understand it, produces something almost exactly like regular book-binding; and if good strong twine is used, we have a flexible binding that leaves the book free to open, even out flat; and at the same time it is so strong as to stand years of hard usage. Almost all other ways of binding periodicals make the book stiff, and unhandy to open. Where one has plenty of time, and I believe most of our bee friends have during winters and winter evenings, this method may be quite valuable, and we tender thanks to friend Cook for having described the whole process so minutely.

## WILL QUEENS HATCH IN LESS THAN 16 DAYS FROM THE EGG?

### SOME VALUABLE FACTS THAT THROW NEW LIGHT ON THE MATTER.

YES; but not much less, as the following will prove. Early in June, 1881, I chose a frame of foundation, partially drawn the fall before, and inserted it in my best stock at eight o'clock in the morning. It was a twelve-frame hive, full of brood and honey. I found the queen, and placed the frame containing her, second from the outside, and set the new frame between her and the center of the brood. I had found, that by so doing I could get her to lay in a frame in a few hours. In just three days I inserted this frame in a queenless stock containing no brood. None of the eggs had yet hatched. They built seven nice large cells. In exactly fifteen days from the time the frame was placed with the queen, just before starting to my school in the morning I examined these cells carefully, but could see none of the queens moving by holding them between me and the sun, nor hear them gnawing. I dismissed school at four o'clock, to hurry home and find my

cells hatching — one queen free in the hive, two at the entrance dying, and two gnawing out, which hatched before six o'clock. This was a few minutes before five. The two remaining cells I gave to a neighbor, who reported that they hatched next day. This proves that queens hatch in *less* than sixteen days, but not how *much* less. It now remains to be shown, that it generally requires at least 15 days. Ever since August, 1878, I have raised nearly all my own and my neighbors' queens by the transposition process. I have found by experiment, that larvæ make their appearance very soon after three days from the egg, and that in a few hours afterward they are large enough to be removed and inserted in queen-cells. If you were to ask some of my neighbors if I had raised as many as a thousand in this way, using these very small grubs, they would probably "smile" I had. I can also prove by the same witnesses, that these grafted cells *invariably* hatch right at *twelve* days from the time of grafting. Now add these twelve days to three days and a few hours, and you will have something reliable. As a further proof, I will add that I frequently delay distributing these cells till the twelve days are up, but that, in such cases, I find them all out in less than an hour. Frequently they crawl out while handling the cells.

Now to account for queens that appear so very much less than fifteen days: The present season I had a colony of Cyprians swarm three times. Second-swarms at this time rarely contained less than a dozen queens, and frequently as many as eighteen to twenty. After the last swarm had been hived, using four frames of brood from the stock, destroying quite a number of cells thereon, I proceeded to destroy all the remaining cells but one, counting them as I went along. I found 110 ripe cells on 12 frames, 50 of which were gnawing out; and such as happened to get away from me could generally fly with all ease. Just behind this stock was a similar one that had swarmed daily for several days. As I approached it to remove the cells a neighbor came into the yard, and we both observed young queens coming and going from the entrance continually. The bees were worrying them, and they were evidently seeking safety in flight. Further observation during the season showed this to be a common occurrence. While things were in this state I started queen-cells in four stocks the same day. I examined them daily for five days, and found them all building cells satisfactorily. The next day was Sunday. Monday in the afternoon I found three of them with virgin queens of a different race from the eggs given them. All three were *dark* Cyprians, while the eggs were from a queen that produces the *brightest* queens I ever saw, and never *dark* ones. This was my first experience of the kind, but it frequently happened afterward, to my great annoyance. Now bear in mind, that I have shown that queens can fly as soon as out of the cell; that the bees frequently worry them, and cause them to seek safety in flight; that virgin queens often enter queenless stocks and destroy the cells, and are accepted, and you will have no difficulty in explaining where friend Pond's queen came from that he thinks hatched in 10 or 11 days from the egg (see p. 55, Nov. No.). I am very certain, that if he could have the same experience that I have had the past summer, he would not think of any other solution than the one I have indicated. J. S. HUGHES.

Mt. Zion, Ill., Dec. 8, 1882.

You have given us some very valuable

facts, friend H.; and from the experience I have had, I can not help thinking you are right. Young queens get into hives oftener than we think, and sometimes we never suspect the state of affairs until we find a laying queen where we thought we had only a cell or a virgin queen. It is this sort of work that makes so many misunderstandings and uncharitable thoughts toward those who sell queens oftentimes. Another thing the above experience brings to light: The wonderful prolificness of the new races of bees brought us by friend Jones. Why! with one such colony as friend Hughes mentions, made to swarm early in the season, it would be no difficult matter to increase to 100 stocks in one single season; and with a good locality they might gather a ton of honey besides. Before you pronounce me beside myself, take a look at the reports of 1882. Are these queens not good ones? While we are on the subject I may remark, that it still seems fashionable to write "essays" on dollar queens. Go on with your essays, friends, if you choose; but meanwhile, note that the stunning reports, the great mass of them, were from bees reared from these same dollar queens. Friend Atchley's, of last year, friend Carroll's of this year, friend McKee's, on p. 582 Dec. No., and friend Malone's wonderful yield of honey given in our Dec. No., p. 591, were all from the progeny of queens bought of us at a low price. Now, after reading these essays it is really funny to think we have hardly a report of any thing to speak of, from a queen that cost \$3.00, \$5.00, or even *ten* dollars. Do you say it is the high-priced queens that furnish the progeny for this valuable stock? Exactly; and the men who rear dollar queens are the ones who purchase the best queens to be found in the world, regardless of price; for it is as easy to rear from them as any other, *especially* when we can get a hundred cells from a colony, as friend Hughes has mentioned.

#### HOW I WOULD BUILD A HONEY-HOUSE.

FRIEND DOOLITTLE GIVES US SOME ADVICE ON THE MATTER.

I AM requested to tell in GLEANINGS, how I would build a honey-house, and I see on page 615, of GLEANINGS for Dec., that E. T. Flanagan desires a plan for building a house for both comb and extracted honey. In the first place I would say, that I should not want extracted and comb honey, and the necessary work for each, done all in one room. My experience says, have a room for comb honey, one for extracted, and a third room large enough to do all the general work for both. Now, any building can be cheaply lined so as to exclude bees, with half-inch stuff, for this general work-room, and the storage-rooms be built on the south side so as to make them convenient, airy, strong, and sufficiently warm to ripen honey thoroughly. If I were building a shop I should build it so that I could partition off these two storage-rooms, one on the southwest and the other on the southeast corner of the same, having the body of the shop for doing work of all kinds pertaining to the aplogy. I should build it two stories, and use the upper story for

storing every thing not in use, or liable to be used for some little time. If I did not wish to build a shop, I should use any old building I had, lining it and fixing as in the case first given for a room for this general work, for such a room is certainly necessary. It would be preferable to have this general room mouse and rat proof; but if an old building is used it could hardly be expected, without quite an outlay. The two rooms used for storing honey I would have mouse-proof, let it cost what it would, for the filth of vermin about honey is not to be tolerated at all. If mice get into the general room, keep them caught out with traps; and as for the rats, they will not be liable to bother unless you have grain of some kind in your room for them to feed upon, and this, of course, you will not tolerate, for this general room is for bee-fixtures and not for grain.

Having given a little outline of what I would have for a general work-room, I will next speak of a room for storing comb honey. This need not be larger than 8x10 for storing all the comb honey from 100 stocks in the spring, even should they produce 200 lbs. per swarm on an average. Whether built in with a shop, or at the side of another building, I should have a wall of mason-work for the sills to rest upon, if drainage could be obtained so the water would not stand under the wall, as in such a case the freezing of the water about the wall would soon destroy it. If I could not dispose of the water I would use abutments. The wall, or abutments, need not be more than a foot high; and if a wall, two or four six-inch square holes should be left at the sides so the air can freely circulate under the floor. If a wall is used, 6x8 inch would be plenty large for the sills, and 8x10 in any case; for you will see that the abutments, if such are used, are close together, not more than 3 feet apart. For sleepers I should use 2x8 inch, and place them but 8 in. apart from center to center, having them run the shortest way of the room. Now, don't think this too strong, and place these sleepers further apart; for if you do you will repent when you get from 5 to 10 tons of honey in your room. I would have the room 9 feet high, so the studding (2x6 inches) should be that length less your plates (4x6 inches), if you build this room separate from your shop. If so built I would have a tin roof, and paint it a dark color; but if in a shop, of course no roof will be needed, as the upper floor will make the roof.

So far I would use good hemlock for the wood employed, for this holds a nail well, is strong, and does not easily decay. For the floor I would use 1½" matched spruce 4 inches wide, and inch pine common ceiling for the sides. If all is put together as it should be, you will not be bothered with mice, providing you keep the door to this room shut when not in use. This door is to be on the side next your general room, of course. I would have a window on one side and one end, which are to be opened in warm dry weather, so as to thoroughly ventilate the room and pile of honey. Over these windows, on the outside, is to be placed wire cloth so the windows can be left open at pleasure without any fears of robber bees. To let the bees out, which may chance to come in on the honey as it is taken from the hive, let this wire cloth run 8 or 10 inches above the top of the window, nailing on strips of lath, or other strips, ¾" thick, so as to keep the wire cloth out that far from the sides of the building, thus giving space for the bees to crawl up on the cloth to the top when

they are on the outside. No robber bee will ever think of trying to get in at this entrance, so your room is kept clean of bees and flies all the while. This completes the building, I believe, except that we want it painted some dark color so that the rays of the sun may keep it as warm as possible. Our door should be in the center of one side, so that on each side of our room a platform can be built, upon which to place our honey. Perhaps all will not agree with me, but I think all box honey should be stored in such a room at least a month before crating, to ripen and sweat out. I know it is a saving of time and labor to crate it at once; but I think it pays for all this extra time and labor, in the better quality and appearance of our product. For the platform I take pieces of 2x12 plank, and cut them 3 ft. 9 in. long, and spike two pieces together, thus making a stick 4x12x3 ft. 9, using three of these on a side, set the 12-way up, which leaves an alley 2½ ft. through the center of the room. Upon these lay four 3x4 sticks, 8 ft. long (4 on each side). Now lay sticks 2x2x3 ft. 9 across these so your sections will stand on them the same as they did in the hive, and have the ends of the sections meet in the center of these 2x2 sticks. Also by means of strips keep the honey out two inches from the side of the building, so that the air can circulate all around the pile, otherwise that next the sides of the building will sweat so as to become transparent. Also, piled in this way the fumes of burning sulphur can penetrate the whole pile by placing your burning sulphur under the pile.

The room for the extracted honey, I would build of the same width, except that I would have it 14 to 18 feet long instead of 10, so as to give plenty of room. The reason we have our comb-honey room small, is, that we can sulphur our honey in as small a room as possible. I would build both rooms as one, so as to save material, and separate them by a partition so made that the sulphur smoke could not get through. You can store your extracted honey in tin-lined vats made to suit you, in barrels, kegs, or in the 300-lb. tin cans sold by A. I. Root, as preferred. In fact, fix up the inside of this to suit you, as probably nearly all will have their own way. I prefer the A. I. Root cans for storing honey, and the Novice extractor. By placing a cloth over the top of these cans, the honey ripens nicely in this warm room, even if the combs are not fully sealed when extracted.

With a description of how I store my combs, which are used for extracting purposes, I will close this already too long article. As you are building your honey-room, have the studding on one side set just as far apart as the top-bar of your frame is long; not from center to center of studding, but leave that space between each. Now nail strips of ¾" stuff, 2½ feet long by 5 inches wide to these studding, letting them stand out into the room in a horizontal position. Let the distance between each strip from top to top be 1 inch greater than the depth of your frame, so as to give sufficient room to manipulate the frames handily. Three inches from the ends of these strips run a partition clear across the room, which is to have close-fitting, narrow doors placed in it, spaced so as to be most convenient. Now hang in your combs; see that all combs not in use are in their place, and not lying about somewhere else. As often as any signs of worms are found, put in a pot of burning sulphur; close the doors, and the work is done. In all this work with burning sulphur, make certain that nothing can by

any means take fire from it before you place the fire to the sulphur, for a room full of sulphur fumes is a bad place to go to, to put out a fire.

Borodino, N. Y., Dec., 1882. G. M. DOOLITTLE.

Inasmuch as friend D. has been not only one of the largest producers, but also one who has produced some of the finest comb honey, we are very glad to get the above valuable hints in regard to making a honey-house. His remarks are the more valuable, as they apply to the construction of a honey-house on any plan, or even the fixing-over of some building our friends may have already in use. A handy and convenient room for honey, and one that will help to reduce the whole matter of handling the crop to a regular system, will be a most valuable adjunct to the whole business. False notions, and moving a crop here and there, without gaining any thing, is one of the sad leaks in any crop; and when we add to it, having the crops injured by moth worms or mice, just because of the lack of a convenient room, we can begin to estimate the value of such a building as he describes. Let us have more suggestions on the matter.

#### PLAN OF A TWO-STORY OCTAGON HONEY-HOUSE.

##### SOME GOOD IDEAS IN MAKING BUILDINGS OF ANY KIND.

**T**HIS is a permanent building, plain but tasty, fire-proof and frost-proof, rat and mouse proof, bee and moth proof, well lighted and ventilated, cool in summer and warm in winter, easily heated by stoves, furnace, or steam, as most convenient; the temperature easily regulated, commodious and compact, simple in construction, cheap and durable. It may have a basement or cellar, if any wish to winter bees in that way; and this cellar, being perfectly dry, will serve for storing lumber, hives, etc. The main story will afford convenient space for nailing up hives, frames, and sections, making sdn., extracting honey, putting up honey for market, etc.; also abundance of room for storing spare frames in handy receptacles. In the upper room spare hives may be stored, painting done, all small stores and supplies suitable arranged and kept, samples of honey in comb and in jars or pails displayed. An observatory-hive at each window will furnish entertainment and instruction,—a great attraction to visitors and customers.

##### FORM OF BUILDING.

The first point of excellence to be noticed in this plan is the form of building. We build walls to inclose space, and to sustain floors and roofs. A wall one foot thick and one hundred feet long, or two walls of fifty feet each, placed side by side, will inclose no space; but if arranged in a rectangular form, say 10 ft. by 40, the whole space occupied will be 400 square feet, one-fourth being covered by the wall itself. The same amount of wall in a square 25x25, contains 625 square feet. The hexagon of 16½ ft. sides has about 700 ft. contents; the octagon of 12½ ft. side has 744 ft., and so on, increasing the contents with the number of sides until we come to the circle, which contains most of all. This shows one reason for preferring the octagon to other forms, since we get one-fifth more room than in the square, with the same amount of wall. The space is better

adapted for entrance and communication and light and fixtures, and inside arrangements generally; the floor and roof timbers are better sustained, and they better anchor the walls. The octagon has as many angles as it is profitable to have; it is symmetrical and stylish, superior to the circular or rectangular form. If any one should prefer the hexagon or other form, by this mode of building, one can be put up as easily as another, as will be seen by considering the nature of the material used in construction.

##### MATERIAL.

The material is lime, sand, and water. It is known as "grout," or "concrete," or the "gravel-wall." If coarse sand, gravel, and stones are mixed in, less lime is wanted. The lime is to be slacked and mixed well with much water, and sand which needs no screening added and worked rather thinner than common mortar; gravel and stones are then thrown in, well wet down and thoroughly mixed. After the composite thus prepared is deposited in the wall, more stones are thrown in. Any rough fragments or smooth pebbles, brickbats, cinders from furnace or forge, slag, or refuse from glassworks, broken tiles, or pottery or glass, oyster-shells, and even Medina clay, if well baked in the sun, will do to fill up. It will pay to dig some distance into some hillside or go several miles for materials. Any brick-kiln will furnish cartloads of just the right sort of stuff, all the rubbish and even the brick dust being available. In fact, suitable materials can be got almost anywhere, and this kind of wall can be put up for about *one-fourth* the cost of wooden walls, and *one-sixth* the cost of brick or stone work. This great saving of expense is partly due to the material, and partly to the method of putting up. The high wages of mason and brick-layer and carpenter are wholly saved, and most of the work is done for what it costs to tend mason. Not so much lime is needed as for the brick-house; the stones, sand, and gravel cost only the expense of hauling. That part of the wall which is below ground should be built with water-lime or cement. Floors, roofs, doors, windows, etc., cost no more than for any other style of building, perhaps not so much. For foundation walls this is the handiest, cheapest, and most enduring substance, whatever we may choose to build upon it. The mason who laid those costly and very handsome walls of brick and stone a little west of the "Home of the Honey-bees," when he came to set the posts for the porches, he and "Sam" just dug some holes in the clay, a few feet deep, mixed up the cement and sand, dumped it into the holes, threw in any rough stones that lay around, and very speedily had some firm and lasting foundations that are much harder than the stone posts set upon them. Seeing which simple and rapid way of accomplishing a good result, I wondered if that man knew he could build whole foundations just as easily and swiftly, and carry up walls also as high and as strong as necessary for any purpose whatever, free from damp when once dry, which stone and brick walls can never be; more easily molded to any shape required, and capable of as much ornament and embellishment as those, and growing better with lapse of time, instead of needing troublesome and costly repairs by and by. Perhaps the mason knew all about this matter, and perhaps not. He did in a workmanlike manner the job that was intrusted to him. Many of our best masons and carpenters disapprove of this style of building, for it is out of their line;

and those who have occasion to erect buildings are usually constrained to have the work done as the builders think best, and perhaps lack the courage to have any thing done out of the common, lest the neighbors should smile or frown on their folly. It is difficult to assign any other reason why this wonderfully excellent style does not more prevail. Beekeepers are progressive men, and those who hesitate to put up those expensive and unsatisfactory structures of wood, stone, or brick, may perhaps be willing to look into this matter and give this method a fair trial. It is not here set forth as wholly novel or original, as the gravel wall has been used in some parts of the country for thirty or forty years, and the octagon form well developed during a shorter period. The whole process has been carefully studied and worked out; and the writer of this paper is prepared to furnish to bee-men on application, at small expense, complete drawings and specifications, so that any common-sense man can put the thing up in a few weeks if he has two or three stout men to shovel and wheel his material. Cost of lumber, lime, and other things, will vary; but the relative expense will be the same, or nearly so, everywhere. So one can figure up at once and count the cost, and can secure a nice cosy place in which he can do his work and keep his wares, and wonder that so little outlay should go so far.

#### METHOD OF CONSTRUCTION.

Many important details must here be omitted, but can be furnished in full to those wishing to build. For foundation, dig a trench three or four feet, to avoid frost; a foot wide or less will do, if not so difficult to dig; of course, the thicker this wall is, the more material is required. Above ground the material is shoveled into boxes or troughs made of boards a foot or more in width, set up on edge where the outside and inside of the wall is to be, eight of those the length of the wall outside, and eight shorter inside. These are properly braced so as not to spread, and the mixture soon becomes dry enough to stand alone, and the boards are set up on top, and another course in same manner.

Here are some figures for those who have not given much attention to this subject: To every bushel of unslacked lime, provide twenty bushels of sand and other materials. Sand and lime alone will do, but will require larger proportion of lime, and take much longer to set. It will be safe to reckon the bushel as a cubic foot, and these are the contents of an octagon of 10 ft.:-

Foundation wall, 80 ft. round, 3½ ft. high.	- 280 cu. ft.
Main story, 80 ft. round, 9 ft. high, and 8 in. thick (less door and windows).	- 450 " "
Upper story, 80 ft., 8 ft. high, 6 in. thick, deducting space of four windows.	- 300 " "
Central shaft, or chimney, 2 ft. sq., (if basement is wanted, make contents of wall 50 cu. ft.)	- 100 " "
Floor (either basement or main floor),	- 200 " "

Total solid feet, or bushels.	- 1330 cu. ft.
of which 1-20 is lime, say 70 bushels.	
Floor timbers, 2x8, - - - - -	260 ft. in length.
Rafters, - - - 2x8, - - - - -	400 ft. in length.

Floor about 500 feet surface, roof about 700, planed and matched, *no ceiling*, roof tinued; chimney carried well above the roof, surmounted by a ventilator and weather-vane in form of a "golden queen-bee." If the sides be longer, one story will give plenty of room, and save expense of one floor, stairs, and windows; the concrete floor only being needed. The building, however, would look rather low, while the two-story would be far more sightly, and the chim-

ney being higher would have better draft. Still, there are many advantages in the one story, and I am pretty sure I should build mine so; and by a cupola and rather high chimney, and perhaps steeper roof, redeem in some degree the defect above named.

I have had some knowledge and experience in this method, but never have seen it applied to a honey-house. I shall be glad to advise with any one wishing to give it a fair trial.

D. F. SAVAGE.

Medina, Ohio, Dec. 5, 1882.

Thanks for your suggestions, friend S. In many respects I should think it would be quite desirable to have a honey-house made of artificial stone, in the way that you suggest; but if I am correct, such structures have not met with very much favor in the years that have passed since they have been suggested. I do not know whether it is because they are more expensive than it would seem from the descriptions that have been given of the methods of making them, or whether it is because they are not dry or durable, or something of that kind. It would seem some different arrangement would be required for comb honey, if we are to ripen it by the heat of the sun, as friend Doolittle directs. Some years ago I was much taken up with the idea of making our house apiary on the hexagonal plan, my ardor has somewhat abated. Of course, we built all of lumber, and the extra work required to fit floors and roof, and working around the corners, was pretty expensive, compared to what would be required on ordinary rectangular buildings. Has anybody a cement or artificial building in use, such as friend Savage describes, and how does it please? Is the expense so much less than stone and brick buildings? Perhaps I should remark, that friend Savage has brought us some very fine drawings and diagrams, to illustrate his plan; but I hardly think it worth while to have them engraved before we have some further suggestions in regard to the matter.

Here are some more ideas about honey-houses:—

#### SUGGESTIONS IN REGARD TO A HONEY-HOUSE.

I write to give you a description of my contemplated plan for a honey-house, shop, extracting-room, and bee-cellar in one. Our repository for comb honey is a room 8 x 20 feet, with shelves 2 feet deep on two sides, 20 feet long, 10 inches apart, having sufficient room to store 8000 or 9000 lbs. of honey. There is a table between these eupboards, or repositories, 3 x 14 feet on top, 3½ ft. high. A stove is in the cellar, and a pipe connecting it with this room for fumigation; and if it is not desirable to smoke the whole room, the honey can be stacked over this pipe, and a tight-fitting box set over the whole. The table is for assorting and packing honey. This room occupies one-half of the building above the cellar. The other half is the shop or repository for extracted or sealed combs. This shop-room is also used for extracting. The brood-comb repository is composed of racks one foot apart, up and down, two feet deep, holding about 18 combs, or in all about 2000. The whole building is 20 x 24 ft., 13 ft. to rafters from the ground. The cellar is 4 ft. under ground, and 4 feet above ground. That below ground is cemented on

bottom and sides right on the earth, being 16 x 20 ft. at bottom, and sloping to the surface; that above ground is frame, lined with brick, and cemented. A track runs from the apiary through the cellar. This I write in reply to friend Flanagan, p. 615, Dec. No.

I have about 20 stands of bees in double-walled hives, and 183 in cellar in Langstroth, all in good shape. My report for this year is about 5000 lbs., about half extracted and half comb, in 1½-lb. sections. If this description of a honey-house strikes your judgment as beneficial to any bee-keeper, you can publish it; if not, lay it tenderly in the basket.

Cedar Falls, Ia., Dec. 7, 1882. A. J. NORRIS.  
We shall not lay it "tenderly" in the basket at all, friend N.; but, on the contrary, thank you for giving us a chance to lay it before our readers.

THAT HONEY-HOUSE.

In reply to E. T. Flanagan's inquiry on p. 615 of December number, I would say that I have a honey-house, and I consider it a very necessary thing in connection with bees. It stands in the middle of my apiary. It has a window on each of three sides, and a door on the other. The sills and plates are 4 x 4-inch oak, halved at the corners, and spiked together. It is sided up with pine boards one foot wide, planed on both sides, and battened. There are two ribs, 1 x 4-inch oak, between plate and sill, to nail the siding to. The floor is maple, covered with oil cloth. It is covered with a hip roof, shingles and tin, and is painted; scroll-work under the cornice. The house is painted inside and out. It is ceiled overhead 7 ft. from floor with boards, furnishing a place above to put cushions in summer; ventilated with screens in windows when necessary. It is furnished with a stand, lounge, chairs, and shelves. It is used for handling bees in, storing honey, and implements used about the apiary; also for entertaining bee-keeping visitors in, to talk up the subject.

A person keeping 200 swarms, I should think, would want a house 14 x 14 feet on the ground, and 10 feet to top of plate. F. C. WHITE.

Euelid, Cuy. Co., O., Dec. 6, 1882.  
I like the idea of the chairs and lounge, friend W., for you can, after showing the visitors the honey and all the sights, set down with them and have a friendly chat; that is, when "biz" will reasonably permit.

REPORT FROM OLIVER FOSTER.

BEEs, AND BUSINESS PERTAINING TO BEEs.

NOV. 1, 1881, found me with 56 colonies and 2 nuclei, all packed on summer stands, except 3 colonies in cellar. Lost 1, sold 3, bought 9, and began '82 with 63, several of which were very weak. The spring was very cold and backward. Dwindling and starving were the order up to June 10th; but with a little sugar, and much watching, we "bridged the chasm." White clover yielded only enough to keep up breeding. From July 1st to 15th, basswood did fairly. Nothing then until about Aug. 15th, when darker honey came in slowly until frost. I think this was from a kind of "smartweed" which grew in abundance in poorly attended cornfields, etc. As I was obliged to slight the honey interests to supply customers during the busy season, my report is not what it might have been.

Aside from my own apiary I took 17 very weak

colonies in the spring to handle on shares for half the honey and half the increase, which gave me 195 lbs. comb honey and 4 colonies. Here are the figures for the season's work:—

	DR.	CR.
By 53 colonies in fall of '81, at \$5.00		\$290 00
By 9 colonies bought, -		50 00
By hives, sugar, and supplies in general, -		152 27
By Adv'g, circulars, and postage, -		25 31
By hired help, -		55 36
To 135 colonies now at \$5.00, - - -	\$675 00	
To bees sold, - - - - -	29 53	\$552 94
To queens sold, - - - - -	86 30	
To 1400 lbs. section honey at 18 c., -	262 80	
To 2115 lbs. extr'd honey at 11.8 c., -	249 57	
To 800 extra L. combs, containing say 1 lb. honey each, at 30 c. per comb, - - - - -	240 00	
To 25 gall. honey vinegar at 20 c., -	5 00	
To 195 lbs. section honey from bees on shares, at 18 c., - - - - -	35 10	
To net profits on fdn. machinery, -	161 18	
To net profits on comb fdn., - - -	59 20	
Received for other work, - - -	30 70	
By net gain, - - - - -		\$1281 44
	\$1834 38	\$1834 38

Average honey per colony, spring count, 70 lbs.; average profit per colony in honey, queens, and bees, \$16.63.

The 156 colonies, including 21 that I have on shares, have about 25 lbs. each for winter; 3 are in cellar (to keep frost out); 29 are in my old chaff hives; 14 are in house apiary, and 110 are in L. hives, packed in piles of 8 each. The latter method of wintering is the one I prefer. The honey is about half sold, at and near home, at the average price given.

OLIVER FOSTER, 63.

Mt. Vernon, Linn Co., Ia., Dec. 13, 1882.

So it seems, friend F., that you, besides doing a good business with your bees, also turn an honest penny making fdn. machines. Well, a great many are going to be wanted; for as wax gets scarce, a simple machine that can be used at home gets to be all the more desirable.

THE STATISTICAL TABLE.

AN EASY WAY TO GET IT, IF WE ALL TAKE HOLD AND HELP.

AT the last meeting of the North American Beekeepers' Society, a committee was appointed to obtain statistics relating to bee culture. Upon consultation the committee have decided to ask, through the various papers devoted to the interests of bee culture, for information directly from the bee-keepers themselves. Will you, therefore, please request each bee-keeper to report his name, postoffice, State, the number of colonies he had in the fall of 1881, the number in spring of 1882, the number in fall of 1882, the number of pounds of comb honey taken in 1882, the number of pounds extracted, and the number of pounds of beeswax? Let it be written on a postal card, like the following:—

F. Torrens, East Liberty, Pa.  
21 colonies fall of 1881.  
18 " " spring of 1882.  
25 " " fall of 1882.  
400 pounds of comb honey.  
300 " " extracted "  
3 " " beeswax.

No date is needed. Send the postal to "Dr. C. C. Miller, Marengo, Ill.," and as soon as they can be ob-

tained, the results will be given through the papers making this request.

C. C. MILLER,  
Chairman Statistical Com.

Marengo, Ill., Dec. 12, 1882.

There it is before you, friends, and now let us all take hold and send those cards in on friend Miller, in a perfect hailstorm. Here goes mine now, before I forget it. Will you not do the same?

## Ladies' Department.

**A**LTHOUGH I can not give as big a report as some can who are engaged in keeping bees,

I am satisfied with the result of the season's labor. I commenced last spring with 7 colonies of blacks. I bought 6 colonies, paying \$10.00 for them. They were blacks also, and in old box hives. We transferred them to the Simplicity (I say we, for my husband helps me in transferring, extracting, etc.). I had one natural swarm, and made two by dividing, and I bought one swarm of a neighbor late in the season, paying 50 cts. for the bees, taking them from a tree, he keeping the honey; so you see I now have 17 colonies, 10 of them Italians, 6 hybrid, and one black, all in fair condition for winter. We have taken 1200 lbs. extracted honey, and 300 lbs. in Simplicity section boxes. Hive No. 10, which I call my "missionary hive," gave me 200 of those boxes.

I have found sale for the most of my extracted honey at 12½ cts.; but the comb honey goes slowly at 20 cts. per box, owing to the superabundance of broken-up comb honey on the market.

The fore part of the season was very unfavorable for bees, being cold and wet. I put on the second story about the middle of June, and the queens took possession of them immediately. I at first tried to keep them below; but finding it difficult to do so, and that it took more time than I could afford, I just put on a third story, and let them go.

Well, Mr. Root, I suppose you have seen as large colonies of bees, but I never did before, and it beat all to see how they did work. While our neighbors' bees were swarming, ours were piling the honey in at such a rate that we had but little time to rest. I consider bee-keeping a pleasant and remunerative employment for ladies, but they must not be afraid of work, or bees either, if they would succeed. I think the Italian bees are much more inclined to rob than the black bee. I find the best way to stop robbing is to throw a cloth of some kind over the hive, letting it extend down in front sufficiently to darken the entrance.

SARAH E. DUNCAN.

Lineville, Wayne Co., Iowa, November 13, 1882.

Thanks, my friend. I think a little more experience will change your views in regard to the Italians robbing. I am very glad to hear the "missionary hive" did so well.

HOW LONG DOES IT TAKE TO GET A LAYING QUEEN, ETC.

Will you give me a place in the Ladies' Department, and allow me to take part in some of the gentlemen's discussions? I noticed, in the Nov. No. of GLEANINGS, that Mr. Pond testifies that a queen can be hatched from the egg in less than 16 days; and again in the Dec. No., Mr. Eby states that he has had queens hatch the 14th, 15th, and 16th day after the colony became queenless, and I simply wish to give my experience in testimony to that fact.

Last March I ordered queens from Mr. Viallon, of Louisiana. Receiving notice from him that the queens would be sent about the 1st of April, I removed the black queens about that time, in order to prepare my colonies to receive the Italian ones. "But the rains descended, and the floods came," and I found my hopes were built upon a sandy foundation; in other words, those floods cut Mr. Viallon off from communication with Texas. I had one fine Italian queen, which I had obtained of Mr. W. Z. Hutchinson the preceding year, and failing to get my queens at the time I expected them, I found that my only chance was to raise queens from that one tested queen. I accordingly took a frame of eggs and larvæ from my Italian colony, and placed it in the strongest black swarm I had, and every day I examined my black swarms (I then had four) I tore down the queen-cells, and with my hairpin removed the drone larvæ until none were left. I then inserted my Italian queen-cells, and did not disturb them for a while, except to get in front of the hives every day, and destroy what few black drones would occasionally stray into them from other apiaries. On the 20th day after I gave the frame of brood to that black swarm, I opened one hive, and, to my astonishment, found the first frame I took out filled with sealed drone brood. This alarmed me; for I thought they must have stolen a black queen from another apiary, until I found "her majesty" crawling among the bees, and as bright as her mother. I concluded, after consulting Mr. Mosher, to let the drone brood alone, as I was positive that I had previously destroyed all the black larvæ, and, sure enough, those drones proved as bright as any I have ever seen since. Now comes the test. In your A B C book I believe you say it takes the egg 3½ days to hatch into larvæ, and the bees feed it 3½ days before sealing it up. Now, allowing 7 days for the sealing of that drone brood, we have 13 days left for the queen to hatch in; and if she was hatched from the oldest larvæ in the frame, it could not have been more than 16½ days from the time the egg was deposited in the cell until it was converted into a laying queen.

BEE-KEEPING; IS IT TOO HARD WORK FOR WOMEN?

I notice in the Dec. No. that Mrs. Shepard asks, "Is bee-keeping too hard work for women?" For the encouragement of the ladies I will review my year's work.

I commenced the 1st of March with three swarms. I have increased them to 27, and taken 732 lbs. of extracted honey. With the exception of a little help I received in extracting I did all of the work for myself, besides making frames for all of my own hives, and several of those which I sold (I mean I put the frames together). I transferred from box into Simplicity hives, and Italianized 7 colonies for other parties, and several times took my extractor and went a couple of miles into the country and extracted honey for persons who had no extractor. Three times I went 9 miles from home and introduced Italian queens for inexperienced bee-keepers. This has been my first year as a regular apiculturist, and I have done a great deal of my housework. Sometimes I have had it seem more than any one person could accomplish, but I always realized the fulfillment of the promise, "As thy day, so shall thy strength be." My husband has been afflicted with rheumatism for several months, and sometimes we fear he will be helpless. My object in increasing the bees, and engaging wholly in apiculture as I

have, was to furnish him with work which would not be so hard for him as that he is at present engaged in (carpentering). My success in the business, which I consider remarkable under the circumstances, I attribute to the promise, "Commit thy way unto the Lord. Trust also in him, and he shall bring it to pass."

MRS. A. C. MOSHER.

San Marcos, Texas, Dec. 6, 1882.

Surely God will bless your labors, my friend, if you go about your work in the way you indicate by your closing text. I am a little puzzled about that frame of drone brood you mention. Was your young queen a drone-layer? If not, how did she come to fill a frame with drone eggs the first thing? A queen might hatch in nine days from the time you put the frame of Italian brood in, but I should hardly think it probable for her to be laying in 4 days more, though it might be. I am very glad indeed to get so good a report for our Ladies' Department.

I am an A B C scholar. Husband died April 2, 1882, leaving me 22 colonies of bees, and no experience. Increased to 29, and, with the assistance of a young lady to handle the smoker for me, took over four barrels of extracted honey from them. Surely the dear Lord has been wonderfully good to me in my affliction; has blessed me both temporally and spiritually, and I praise him for it.

MRS. HENRY CULP.

Hilliard, Franklin Co., O., Oct. 3, 1882.

Thank God you have done so well with the bees, my friend. I have often thought of you anxiously since our old friend, your husband, was taken away.

#### HONEY FROM GLADIOLUS.

We all read GLEANINGS and the JUVENILE, and enjoy them very much. I shall want some honey-plants for my flower-garden next year. Did you ever notice the amount of sweet water in the gladiolus blossoms? When they begin to close, my children pull them from the stalk and suck the honey, as they call it. I think there is four or five drops in every one, but I do not know whether bees will work on them, as there are none within ten miles of us (except bumble-bees). By the way, I have noticed how they carry the pollen, I suppose. I have seen them with cakes, or flakes as large around as a small pea — of course, flat: but they look so queer, and seem to resent any inquisitiveness about their affairs.

MRS. H. U. ROSE.

Leland, Wash. Ter'y, Sept. 22, 1882.

I do not know that I have noticed the honey in the gladiolus, but I have often noticed honey in different kinds of house-plants; and since the matter has been discussed so much, I have noticed in what great profusion the nectar is often secreted, when the conditions are just right. Thank you for calling our attention to the gladiolus, my friend.

As to that smoker, it is just a perfect little smoke-stack, only it will "grunt" every time it breathes. I suppose it is wrong for me to say so, but I am awful glad I broke the Simplicity, for the Clark is so much better.

I commenced this spring with one hive of bees, and not very strong at that; increased to 4 — one natural swarm, and two artificial; took 70 lbs. of

nice honey out of an old hive, besides a lot of boxes that were not filled out. The natural swarm made 15 lbs. I am very thankful, and *wonderfully* pleased. If anybody had told me two years ago that I would handle bees and get so much honey, I would not have believed it. Of course, there are reports of others who have done much better; but I am satisfied and thankful. Two of my neighbors took be-trees, and they brought me the bees from three trees. They are a large brown bee; so in all I have seven hives of bees.

ANN SCAIFE.

Barbour Mills, Lycoming Co., Pa., Dec., 1882.

I am very glad indeed, my friend, to hear you are pleased with your new industry, but I am very sorry to know that any of the smokers we have sent out have ever behaved in so undignified a way as to "grunt" when they are called on to help, more especially when it was a lady that required their services. If it is one with the new spring, a small drop of oil on the coil will fix it. And so you have already transferred bees that came out of a bee-tree, have you? Well, I think you might feel encouraged, for only a beginner.

#### WINTERING IN CELLARS, AND AMOUNT OF HONEY CONSUMED.

HOW MANY POUNDS OF BEES ARE THERE IN AN AVERAGE COLONY OF BEES IN WINTER?

WHEN the flow of honey is stopped by frost I remove all surplus boxes, and examine the brood-frames to see if they have enough honey to winter on, which should not be less than enough to make 4 full frames; 5 and 6 would be better, if one does not want to feed in spring. I use the Langstroth hive, and, after they are examined, the entrance is contracted from one to three inches, and the honey-board put on. The honey-boards have in the middle, running crosswise, a slot-hole  $\frac{5}{8}$  x 8 in., which are opened when it begins to freeze.

When it is time to place them in the cellar I take common lath and saw it in pieces the exact width of each hive, and place before the entrance, leaving a space of 1-12 of an inch underneath for ventilation; this, together with the hole in the honey-board, and the cover also raised about 1-12 an inch, is all the ventilation I think is needed, and they will remain very quiet, unless too warm weather sets in, or dysentery makes its appearance, when they should be taken out.

Before placing in cellar, each hive is weighed and then placed in the cellar on 2x4 scantling, raised some 14 inches from the ground, the rear of hive being raised an inch more; if bive and all weigh 75 lbs., I think they will winter all right, although I had some weigh as low as 65 lbs., and yet winter well; however they had to be fed some in spring. The following is taken from my diary:—

Placed in cellar	Av. loss per colony for winter of	No. of days in cellar
Nov. 4	'79-80, 6 $\frac{1}{2}$ lbs	144
" 14	" '80-81, 9 $\frac{1}{2}$ "	151
" 14	" " '81-82, 9 $\frac{1}{2}$ "	125

General average loss, - 8-4-9; av. No. of days, 140

In looking over the back numbers of GLEANINGS I see in the April No., 1878, W. A. Eddy's report of 52 colonies which were in the cellar 100 days; average loss per colony, 14 lbs., which makes a difference of a little over  $5\frac{1}{2}$  lbs. per colony, which would tally one in favor of having the entrance nearly closed.

Next, the cellar can be used for storing other things, and, by placing some boards in front of the hives, a candle can be taken into the apartment without disturbing the bees, which, for those who keep only a few hives, is very important.

While I think a thin-walled hive is handier for winter, a chaff hive would be better for the spring, as we have lost more by spring dwindling than by wintering. Last spring we had 6 colonies; 2 died by spring dwindling, and the other 4 were very much weakened; increased to 10 and got 500 lbs. comb honey; and if we had had time to take care of them, and put on more sections, we might have had 200 lbs. more, as the bees were lying idle in the best part of the season. One hive gave 200 lbs., but no swarms; but as we keep bees only for honey for home use we were content, as we have enough and some to spare. All ten hives are placed in the cellar in good condition, save one late swarm, which may need feeding toward spring. I will see how this winter will compare with the rest.

REUBEN SNIDER.

Lettsville, Louisa Co., Ia., Dec. 16, 1882.

The above is very moderate for the amount of stores consumed, friend S., and any one ought to be satisfied with it; but since we have been selling bees by the pound I have often been led to inquire, What is a colony? A single pound of bees may come through the winter safely, and, in fact, I am not sure but that we sometimes see only a half-pound go through and come out lively, especially if wintered in the right kind of a cellar. Now, what we would like to get at is, How many pounds of stores will be needed for one pound of bees? Suppose we say five, and the result will then be, that, while a small colony may winter all right, and consume less than 5 lbs., a good strong one might consume 25 and starve to death after that. One other point: The single pound of bees *might*, with a good queen, build up so as to equal, or even go ahead of, by the first of June, the colony that had 5 lbs. of bees in the winter, and consumed 25 lbs. You see from this, friends, one reason why we have such a diversity of reports in regard to the amount required for winter. We have never weighed colonies wintered in the chaff hive, but I think they often winter through until they begin to gather pollen, with not much more than friend S. has reported.

### SELLING EXTRACTED HONEY.

HOW FRIEND "MALONE" SUCCEEDED IN SELLING HIS HONEY.

**I** THOUGHT I would give my experience in selling extracted honey. My first honey I took to market July 18th in Mason quart jars. I sold at 50 cts., jar thrown in. I supplied most all the groceries in the city. I sold my honey readily, and felt proud, "you bet." I loaded up the 22, my second load, and started to market, feeling happy of course; but not a pound could I sell at any of the groceries. They all told me that they had all the honey I had sold them, and that extracted honey would not sell; if I had comb honey, they would sell it. This gave me the "blues." Now, what to do was what troubled me. The first thought was to buy bar-

rels and ship my honey; but a new idea struck me, and that was to start peddling. I had an errand at the mill, so I drove up. Said I, "Look here!"

He said, "What's that, Bill?"

I said, "Pure linn honey, just from the flowers; taste it."

He did, and said, "What's it worth?"

I said, "Fifty cents."

I sold two, and started up town and met a man with whom I was acquainted, and told him the same, and sold to him; and before I got half way around the square I had sold all out for the cash.

With the next load I went into the Court-house to the county officers and into the banks, and among the physicians and lawyers; and nine times out of ten I made a sale, and for the *cash too*. I was in town yesterday; and every time I go I meet people on nearly every corner, and they will say, "Bill, have you got any more honey? Can't you take out a five-gallon keg or jar, and bring me some more honey?"

But right here a trouble sprang up. Those grocery-men commenced to growl; I was selling to the consumer at the same rate I sold to the merchant! Was this right? My honey is all sold, except about 400 lbs., and now the trouble is going to be to supply the demand next year.

RUNAWAY SWARMS COMING BACK TWO WEEKS AFTER.

I had a young Cyprian queen that took a fine swarm of bees to the woods about Aug. 27, and was gone 15 days, and came back. This seems strange, but I had so much trouble to get her to laying last spring that I got acquainted with her, and knew her as soon as I saw her. The sequel is, that the swarm went one mile and stopped, and the tree was cut on the 14th day, and the bees hived; on the 15th they came home and alighted. They were glad to get back. I think I shall breed from her next year. I have my bees put up so warm, that on the 8th of December they carried out dead bees, when the thermometer was 14° below zero. This was on a clear day; when cloudy they are still.

WM. MALONE.

Oakley, Mason Co., Ia., Dec. 12, 1882.

The above letter possesses a double interest to us, from the fact that friend M. is the one who gave us the whopping report on page 591 of Dec. No. I quite agree with the moral in the little story above; but while opening the market in this way by appeals to those whom we know, I would at the same time remember the retailer, and either ask 60c. of consumers, and only 50 from the dealers, or say 45 to the dealers, if we can stand it, or any way so as to have a uniform price at retail, and a clear understanding as to the price the honey is to be sold at. If we do this, no retailer will object to having the market worked up by the producer.—It is true, that a swarm does sometimes come back when disappointed, or upset in their plans, as in the instance mentioned; but I have never been able to decide whether it was the queen that did the business, or the bees, when they confer together in the matter, or whether it was sometimes the one and sometimes the other. We know it is sometimes the queen, for she has been known to lead an entire colony, to which she had been introduced, back to the spot where she took her first wedding flight.

## Heads of Grain, From Different Fields.

BEES IN NEBRASKA, ETC.

**M**Y own experience, although not very flattering, may be the means of letting people know that bees can be kept in Nebraska, and be made a success. In the first place, I want it understood that I am an A B C scholar, and at the very foot of the class, second place. I am not in the habit of writing for publication; so, friend beekeepers, please excuse all mistakes. Now about the workings of the wonderful little bee. The first of last July I bought of one of my neighbors two colonies of Italians, and, not knowing any more about bees than a child does about his letters before he can talk, of course it was not a very easy task; but having a desire to learn the business, I went at it with GLEANINGS for my guide (thanks to friend Root for instructions in that way). After a few days my bees were ready to swarm; then my first step was to divide, for it was bees I was after, not honey. I went through it in good shape; I got only a few of those sharp bites that they are apt to give a beginner; and having my wife with me, of course she shared the same fate. But we did not give it up in that way. We kept on dividing whenever it was needed, until I had five colonies, and had one go for parts unknown; and having good weather for honey they worked right along, just as though nothing had happened, filling three frames with very nice honey.

In regard to the amount of honey received from them, I can not brag; for I did not give them a good chance, on account of increasing my number of bees; but they stored enough for themselves and gave me 75 lbs. surplus. I think that was well done for the first step. I am wintering mine on their summer stands, as we do not have very cold weather here, and not much snow. My bees have flown every day yet, except four or five. To-day they were lively, and flying some when it is cold.

And now, friend Root, in your behalf I will say this: I believe you to be a good Christian man by your kind and loving words spoken through your columns. My family listen to them with ears wide open, and say they would like to see Mr. Root and his place of business. We are strangers to each other, although I hope we are not so in Christ.

Steele City, Neb., Dec. 11, 1882. L. L. WHING.

Why, bless your heart, friend W., I don't know what I have done to merit such kind words; I am afraid if you should come and see me so driven and hampered with business as I often am, you would be disappointed, at any rate. Your letter has done me good, for I can now go about my tasks with a lighter heart.

SWARMING AT NIGHT.

W. McKay Dougan, on page 606, brings to mind a case of bees swarming at night. One day in July, 1881, while visiting my grandma's, and while out looking at their bees with my cousin and uncle, they told me one swarm had played a fine trick on them by absconding one night after dark. While they were milking the cows they heard the bees making a noise like swarming, so they went to see; and, sure enough, they were pouring out of the hive, and

seemed to be a big swarm by the noise they made, for they could not see them in the air, as it was so dark. After all were out of the hive they arose high in the air and seemed to go off in a north direction, These were blacks, and the hive was full of moths.

SWARMING TOO EARLY IN THE SPRING.

Did you ever have any bees swarm so early in the spring they could not gather stores to live on? One of my neighbors had one such. He did not know what to do with them; none of them would leave the hive when there was a warm day, so he came to me. I went over to look at them, and found a big swarm of black bees. We opened the hive, but the bees made no motion to sting, and seemed to care for nothing only to cluster as closely together as possible. They had been hived four days. We went to the old hive. It was a box hive, and full of brood and stores. He turned it to one side and pulled one comb down, and we went and fastened it in the new hive, for he had no other one. We found the queen in this new swarm. It looked like an old queen. I told him he had better feed them. These bees did no good, for the moths got them in the summer. It was some time in May that they swarmed. The old stand cast several swarms through the summer, but none of them did any good. What was the matter with them?

19° BELOW ZERO.

It was pretty cold here the 7th. It was 19° below zero, with about five inches of snow; not much like last winter, is it?

Lima, Ill., Dec. 9, 1882.

J. A. THORNTON.

The case you mention, friend T., is not as hard to account for, because it was just at dark, or nearly dark. Very likely they had a tree already picked out, and went directly for it, and reached it without trouble. Bees often have to be fed when they swarm very early in the spring.

AN A B C SCHOLAR'S REPORT.

I must say, that I am well pleased with the extractor, Favorite scales, foundation, and Clark smoker. Although the scales dropped through the box in transit, and broke the flange on the bottom in two, it did not spoil them so but that I could weigh the new baby with them the other day.

I have just completed my first year in apiculture, and will give you a report:—

Paid for 8 colonies, bees delivered.....	\$30 00
For extractor, scales, fdn., lumber, etc.....	27 50
Time lost from work.....	4 60

Total.....	\$62 10
------------	---------

Received 320 lbs. extracted honey, sold at 1c.....	\$44 80
1 colony sold.....	7 00

Total.....	\$51 80
Amount expended more than received.....	10 30

Have on hand, 8 colonies of bees @ \$7.00.....	\$56 00
Fixtures that are as good as new.....	26 00

Total.....	\$82 00
Profits.....	71 70

I did the work mornings and evenings with the four days given above, and worked in a shop near home ten hours per day for \$30.00 per month. The four days I spent with the bees I received \$17.92½ per day, besides the knowledge I have gained, that I set no price on, as it is not for sale. My honey was nearly all white-clover. I would have had more if the weather had not been so cold and wet.

NON-SWARMING BEES.

There is a colony in this place that has occupied

the same hive for 12 years, and are not known to have swarmed in that time. There has been as high as 200 lbs. of comb honey taken from them in a single season. At one time they built a comb 3 ft. long, 18 in. wide, and 4 in. thick. They have never received any care, except to rob them. I shall try next season to get some in shape to be convenient to handle, but as near like them as possible.

M. D. McCORKLE.

Cortland, Trumbull Co., O., Nov. 27, 1882.

Friend M., we like your letter, all except one point. We are cross about that "new baby" because we haven't one at our house.— We have heard of non-sitting hens, and some time ago something was said about a breed of bees that wouldn't swarm; but no one has ever offered that strain for sale, that we know of. Perhaps friend Hasty and a few others might buy some, if you could get that swarm of bees and give us some queens reared from it. Who knows?

#### WIRING FRAMES ON HOOKS MADE FROM BLIND STAPLES.

On page 615 of GLEANINGS, I notice a communication from C. H. Deane, regarding wired frames by the use of staples. I send you the inclosed as a specimen of the way I wire frames; the hooks can be rapidly prepared from blind staples, and clinched in the bottom of top-bars readily. This I call the "Diamond frame," and it is very securely braced. One staple will make two hooks. Try one frame.

J. L. ELLINGWOOD.

St. Joseph, Mo., Dec. 9, 1882.

Thanks, friend E. Your staples work well, but it is quite a little task to cut blind staples in two, and bend each end a little. We want finished ones, turned right out by a machine. If you drive them through and *clinch*, that takes time, and it will mar the appearance of the top-bar.

#### OREGON.

I just want to say that Oregon is coming on in "beesness." There is an apiary in Portland City, of 150 stands, and it is not at all an uncommon thing to find from 3 to 12 stands on a farm. Father has 12; he went out to feed them one day this fall without his bee-dress on. I was in the yard petting the chickens when I heard him yell, and pretty soon he came stamping around the house, pawing his ears, first one and then the other. When he saw me he laughed, and said he guessed he'd put on his bee-dress. He wants to send for some things; and I thought, while he was picking them out I would "chip in" a word or two.

A. M. HALL.

Beaverton, Ore., Nov. 27, 1882.

That's right, friend H. We are always glad to have the young folks "chip in;" and still you do not say you are one of our juveniles. Somehow there seems to be a sort of juvenile "twang" to your letter, after all. How about honey in Oregon? Surely you don't feed all the time, do you?

#### VIRGINIA CREEPER AS A HONEY-PLANT.

I notice that you have not mentioned the Virginia creeper (*Ampelopsis quinquefolia*) among your list of honey-plants. Last season my bees (natives) worked on it for nearly two weeks as busily as ever I saw them work on fruit-blossoms. I thought it was perhaps owing to the great scarcity of honey; yet the buckwheat was still in full bloom; in fact, our bees

in this section would have fared very badly this winter if it were not for the buckwheat.

LONDON HALL.

Cowansville, Quebec, Can., Dec. 7, 1882.

It has before been alluded to in our back volumes, friend Hall, but we have never had a report before so definite in regard to it as the one you give.

#### HONEY FROM THE ABUTILON, OR FLOWERING MAPLE.

This evening my wife noticed a yellow abutilon, or flowering maple, which we have now in the house, beautifully in bloom, and on each blossom we can see a large drop of honey, which on taking off and eating, is very sweet, and in a short time there is another drop of clear honey. Will not this make a good bee-plant?

E. EDMUNDSON.

West Branch, Iowa, Nov. 29, 1882.

To be sure, it will make a glorious bee-plant, friend E. We have a flowering maple here in the office, but there isn't any honey in the "posies." Tell us how much you will take for some slips from the plant. Will my good sister, and other "womens" who know about propagating by slips, tell us how we shall go to work to get a lot of them? and has anybody else got a "strain" of flowering maples that lets the honey run out every little while, or oftener? and will you tell us, or have your good wife do so, my friend, about how many minutes or hours it is before there is another drop after you have eaten one drop? Don't you believe I can ask questions almost equal to the women folks, when I get started, eh?

#### CAN A QUEEN BE REARED IN LESS THAN 16 DAYS FROM THE EGG?

You know I am one of the youngest of the A B C class, but studying the A B C book, and following it strictly. I received queens last season simply for my instruction, and I must say I find nothing very new in the statement of J. E. Pond, Jr., Nov. GLEANINGS, pages 545, 546. Last year I raised a queen in 14 days, counting two days in egg and 12 days more till hatched out, first and last days counted in. The queen was a little dark, but her progeny proved nearly the best this year, and in hardiness, prolificness and as honey-gatherers, better than her imported mother. On Wednesday, July 5, I gave to a strong divided colony slices of comb with new-laid eggs of the same queen (imported, 2 years old). On Saturday, the 15th of July, I mentioned to another bee-keeper, that by next Tuesday or Wednesday I would have a nice lot, about 20 or more, young queens. Next morning, about 9 o'clock (Sunday the 16th of July), a swarm issued from the hive in which the queen-cells were. I hived the swarm in a new hive, and then opened the other to look after the cells. I found a young queen just emerging from one cell, and other cells open, and the little caps yet on hinges. I cut out the slices with cells; and in less than 5 minutes, 4 splendid young queens hatched in my hands. My wife had enough to do to save them and place them in glasses and cups; and in about an hour there were standing 18 cups and glasses on the table, each containing a perfect young queen; about 8 cells hatched the 2 following days, but showed symptoms of weakness compared with the others, and so I did not use the same. Now, my dear sir, I know you will chide me when I tell you it

took me nearly all Sunday to prepare 18 nuclei to save the queens.

Count first and last day of Mr. Pond's statement, as we should, and you have 14 days; the queen may have laid in the center of comb  $\frac{1}{2}$  hour later after the comb was put in, and Mr. Pond states himself that the queen was not 24 hours old; she may have been much younger yet, and you have to count the last day. I always look on these queens hatched in 14 days as being a sign of strength and hardiness, but I may be wrong.

#### LARGE-SIZED BEES.

Some Eastern man who saw my Italian bees, says they are much bigger here than in the East, and I nearly believe it, because I put the sample of the Jones perforated zinc before the entrance (not in the honey season), and only a few bees could enter with difficulty, and many not at all. G. DAMKOHLER.

Clarence, Shelby Co., Mo., Nov. 29, 1882.

And so you would expect that what we call ten-day queens would be superior, rather than otherwise, would you, friend D.? I believe it has been before suggested, that the first hatched are the strongest and most vigorous, and this would imply that nature's course in artificial swarming is the right one; for the first hatched then destroys all others, unless there are after-swarms.—In regard to taking care of 18 young queens on Sunday, I do not know but that I should have done nearly the same. I would do just as little work as possible on Sunday, but still I should not want a great deal of property to be lost, when it was clear and plain it would be lost if not cared for.—Your concluding idea, that the Jones perforated zinc is going to prove a gauge to *size* our bees by, is worthy of some attention.

#### REPORT FROM THE OLD KEYSTONE.

The season of 1882 has been a very indifferent one for bee-keepers here. The spring opened out beautifully, promising abundant bloom of maple, and fruit of various kinds. Our bees had just fairly got to work when a cold wave passed over our country, freezing every thing in the shape of early bloom. I tell you, it made me feel "kind o' blue." The next thing in order was to feed quite a number of colonies, to keep them from starving. Oh how I pitied them! they tried to find honey in the frozen bloom, but failed. By and by the white clover came, and along with it came cold wet weather. It yielded but a small amount of honey — about enough to keep up brood-rearing, etc. I began the season with 29 colonies — 27 Italian and 2 black, all in fair condition. I transferred the 2 blacks, and two weeks after I swarmed them and gave them Cyprian queens. I increased from 29 to 63 colonies; doubled up to 59; have gone into the winter with 45 in good condition, 5 rather weak, and 9 nuclei on 3 and 4 frames. I have now 52 Italians and 7 Cyprians, whole count; had one swarm that went to the woods, that is not included in this count; two-thirds of increase was by natural swarming. I reared and sold 21 queens, most of them tested. Now for the surplus: I used 700 one-pound section boxes in my apiary, filled with fdn.; got 300 partly filled; only 50 in marketable condition. The whole 700 were filled with nice comb, but only the above in honey. I got 150 lbs. of comb honey from my early swarms, and about 200 combs in frames, built out nicely from fdn.

We had a fine flow of honey from buckwheat —

the best buckwheat season we have had for 15 years in our part of the State, and I tell you the little fellows lost no time while it lasted. Now this, my report, will seem insignificant, compared with many I read in GLEANINGS. I should be pleased if I could write a better one, but the above is all I can truthfully give.

JOHN N. PUGH.

Hannahstown, Pa., Dec. 18, 1882.

#### HONEY-DEW, AND HONEY THAT WASN'T "DEW" AT ALL.

I never believed in honey-dew. Why, it is no trick for honey-dew to be found on hickory leaves when the honey is in the body of the tree. When we buy a load of hickory wood, and it is green, and lies a day or two on the woodpile, we can almost always see the honey oozing out at both ends of the wood. But where I am beat is here: I bought one L. hive; the top was made of flooring boards; I put in a good swarm of bees, and had a thick piece of heavy ducking over the brood-frames. Well, after they had filled the frames I took the top off the hive, and on the ducking I found some water, as I supposed, and I thought to wipe it off; but to my surprise it was thick honey, bright and clear. Now, how did that honey get there? There was about a table-spoonful of it. I never heard of any thing like that before. There are no trees standing near my hives.

B. F. BARR.

Flagler's, Marion Co., Ia., Dec. 9, 1882.

Friend B., I think somebody opened your hive, and cut out a chunk of honey, letting some drop on the mat; afterward the bees filled up the gap; but the honey stayed, and ripened on the ducking until you found it. Eh?

#### ABOUT GLEANINGS, ETC.

The first copy of GLEANINGS I ever saw was the May number of 1878; that and friend Root's price list came together, as I believe they generally do, to strangers. It was also the first copy of *any* bee paper I had ever seen, and that and the price list were a complete puzzle to me; but the familiar, everyday, Christian-like manner in which the editor talked to his patrons also seemed strange, for I had never seen much if any of this kind of talk outside of the religious papers, and very little of it in *them*, and consequently I soon came to the conclusion that friend Root must be a rather uncommon kind of a personage, probably a superannuated clergyman who had ceased from the active duties of his profession because of ill health or something of the kind, and had taken up bee-keeping as a sort of recreation, and had become an enthusiast in the business. But after I had read a few numbers I came to the conclusion that I was wrong about every thing except the enthusiasm, and I am quite sure he is not lacking in that regard. How much Novice has done to unite the bee-keepers of our land into one great band of brothers and sisters, it would be difficult to estimate; and as to how much he has done to elevate bee-keeping to the dignity of a pleasant and remunerative pursuit which is giving support to thousands of noble men and women, we have, among many others, the testimony of so learned and able an apiarian as Prof. Cook, who gives the following: \* \* \* \* \*

#### DOLLAR QUEENS.

A great deal is being said in the journals about cheap queens, both for and against them. As a great majority of queens are reared much in the

same way, that is, other than by natural swarming, it seems to me that the question, when boiled down, is about this: Which pays best, for me to buy untested queens, and test them myself, or pay some other bee-keeper for testing them for me, whose test might not suit me after all? Although I am not as fully informed on the subject as I hope to be, with my present knowledge of the subject I think I am in favor of cheap, or dollar queens. With the great number of reports of large yields of honey that are coming in from all over the country, and the success of apiarists generally, taking into consideration the great numbers of cheap queens sold, I can not see how a man can stand up before the bee-keeping public and say that dollar queens are hindering the success of our favorite pursuit. Queen-breeders should rear their queens in the most approved manner, and deal with their customers as they would wish to be dealt with, and the queens will speak for themselves, and their patrons will receive the worth of their money.

St. Clairsville, O., Dec. 19, 1882. R. M. DENHAM.

Why, my good friend D., what have I ever done to merit such kind words from one who has been, until to-day, a perfect stranger. Perhaps I am doing wrong to let it come out in print at all; but I wanted what you said about dollar queens; and then your whole letter runs on so neighborly like, it seemed too bad to spoil it, more than to put stars in place of those kind words you quoted from friend Cook. Don't you know such complimentary speeches should never be repeated right to one's face? Well, well, the next letter I get that cuts and hurts, I will place alongside of yours, and then try to let one balance the other, and so manage to look happy still.

#### CHAFF CUSHIONS; SUGGESTIONS IN REGARD TO MAKING.

My cushions, which I consider superior to any I have ever used, I make as follows: I use a frame of  $\frac{1}{2}$  or  $\frac{3}{4}$  in. stuff by nailing or dovetailing the corners together, just large enough to fit the inside of the hive, easily making the frame as deep as the thickness of cushion desired. I prefer about two inches. Tack a piece of burlap on the frame, with 3-oz. tacks, for a bottom. Set it on bench, and fill with chaff; tack on another piece of the same material on top, and the cushion is completed. Use  $\frac{3}{4}$ -in. strips of thin leather or oil cloth to tack through. It prevents heads of tacks from pulling through, and holds cloth firmly to the wood. Tack on side and end, then stretch the cloth firmly each way while tacking the rest, and it makes a nice smooth job. Perhaps these frames may be a trifle more expensive than those without frames; but after a thorough trial I consider them enough better to much more than pay the extra expense; they hold themselves and chaff in much better position in the hive, and bees are prevented from crawling up at the sides on top of the cushion, which is sometimes attended with considerable loss, especially in sudden changes of weather.

H. V. N. DIMMICK.

Hubbardsville, N. Y., Dec. 18, 1882.

Thanks for the idea, friend D. If we understand you correctly, your plan is simply a box with the depth of cushion desired, having for its top and bottom burlap tightly stretched over, and fastened. This box, filled with chaff, gives two good features:

First, it insures good ventilation, and also prevents the bees from getting above. Right here we might mention that friend Drum, at the Ohio State Fair, showed us a cushion similar to the one above. He also gave it as his opinion, that a cushion with a depth of two inches is better than those of other dimensions. This he says he has verified by experiments; first, at a depth of one foot; then six inches, and afterward of other dimensions, until he decided on two inches. At these dimensions he found his bees wintered the best, coming out in the spring strong, dry, and healthy. Friend Drum left the top open.

#### RAPE AS A HONEY-PLANT.

Now a little about rape. I sowed a little strip about 12 feet wide and 10 rods long, after early potatoes and peas were harvested. I think it was early in August. Although the weather was dry for some time, it did well, and was yellow with blossoms long after severe frosts came; and every time that a bee dared to risk himself outdoors he would go for the rape; and when it was warmed up so they could fly freely they were as thick on it as they could be on buckwheat, and seemed to gather both honey and pollen quite freely after it had frozen so hard that it had commenced to fall down. The little balls of pollen I could see, and could see the bees busily sucking honey from the flowers. The 8th of Nov. they worked thick on it, since which time they have not been out any. Now, would it not be very nice to have a good patch of it to keep up brood-rearing very late in the fall, and thus have plenty of young bees for wintering, and also to keep them out of mischief after other sources of honey are cut off? But on the other hand, how would so much pollen, gathered late, affect the wintering? and how bad a plant is it to get in the land? or, rather, how much of a job is it to get it out of the land? I was rather glad that mine froze and did not fill, for I felt rather afraid of it. I should think it would be a good crop to plow under for manure.

#### RAPE FOR FORAGE.

And rape is good to help out short pasture. My cows ate it readily, and a bull that I keep up was extremely fond of it, and would eat it up clean, even the stalks that were half an inch through. If we sowed early enough for the seed to ripen, what could we use the seed for? Would it do to grind with oats or corn for feed?

E. Z. GREEN.

Montague, Mich., Dec. 1, 1882.

I think rape is going to prove an excellent feed for bees and live stock, especially if sown as late as yours was. I should never think of calling rape a weed, even if the seed may live over, and come up next year. One of our "young Canadians" says they raise rape in Canada, on purpose for pasture; and I am inclined to think it would pay well, as it can be raised in the fall, without interfering at all with any other crop. We have made arrangements to furnish the seed at lower prices than formerly. Will those having seed for sale send samples, and say what they will take for it?

#### STATISTICS ON BEES AND HONEY.

I was in hopes the subject of collecting statistics for the use of the National Bee-keepers' Soc'y would be discussed at the Mich. State Convention last

week, and some plan agreed upon to be carried out in this State. I think Professor Cook's plan of furnishing supervisors or assessors with blanks to be filled out at the time of making the spring assessments would be the most feasible, at least in this State. It would make but little additional labor for that officer, and, as a general thing, I am confident they would be willing to assist in the work. A postal card properly prepared could be furnished each supervisor, who would fill them out and forward them to Professor Cook or some person designated by the National Committee without any expense for postage above the price of a postal card for each township. These postal cards could be furnished by the State Society, or the various societies of the State, or in part by voluntary contributions from the bee-keepers of the State, at a very slight expense to each. With this plan carried out, the statistics could be collected throughout the State with much more accuracy, and with less trouble and expense, than by any other I have seen advanced. I can see but one objection to this plan: It might cause a more general assessment of bees for taxes. But as some are already paying taxes on their bees, I can see no plausible reason why all should not be treated alike.

S. H. MALLORY.

Decatur, Mich., Dec. 11, 1882.

I entirely agree with you, friend H.; and, in fact, the assessors of the State of Ohio do tax the bees and honey both. In regard to taxes, I have always paid taxes, and would be ashamed to have it known that our industry was not taxed like other farm stock.

As you failed to visit me one year ago this fall, as you contemplated, I will mention some things you would have seen if you had come; especially a hive that has wintered bees successfully for the past five years.

#### A SUCCESSFUL WINTERING-HIVE.

The hive is one story and a half, used for comb honey; the brood department is 14½ x 14¼ in., 11 in. deep, no chaff at the bottom or front; two inches of chaff at the back and sides. The chaff at the sides is separated from the bees by boards ¼ in. or less thick, shoved down into grooves cut in the end-boards before the hives are put together. I think it very essential that the bees be separated from the chaff by as little wood as possible. I see that there are passages through the combs, and two sticks ½ x ½ inch are laid across the tops of the frames; then one thickness of cotton cloth, two of old carpet, and a chaff cushion 4 inches thick. I would never use enameled cloth over bees in winter. I have about fifty of the hives in use — 95 swarms in various kinds of hives. I have 3 tenement hives, 4 swarms in each, all doing nicely at all times of the year. I cordially invite all bee-keepers to make me a visit. They shall have their board and lodging free, for I generally learn something new from every discussion of the bee subject.

#### MOVING A WORKER EGG TO A DRONE-CELL.

Being very anxious to ascertain whether the worker bees have the power to change the egg from a worker to a drone, I transferred eggs from worker-cells to drone-cells in a queenless colony — such a swarm being more anxious to raise drones. They produced worker bees. The eggs may have been too old — too near the time of hatching. I intend to make further experiments in the same direction. Hoping we shall solve that puzzling question before

another summer passes, I should like instructions from any one how such experiments should be conducted.

#### FOOT-POWER BUZZ-SAWS.

I should like to say to those who think of making foot-power buzz-saws, don't do it; I have tried it. It is too hard work for any man to cut stuff for more than a dozen hives.

#### A HOME-MADE WINDMILL.

I now run a 6-inch saw through 2-inch plank by means of a windmill of my own construction, doing good work, making surplus boxes and hives for 100 swarms. This windmill cost me not to exceed \$25.00 besides my own work. It also runs a drag-saw that saws my stovewood. The buzz-saw, mandrel, and bearings, cost \$2.00, besides my labor. For bearings I "Babbitted" in hard-wood boxes, which is a good way to do, I think.

I did not get much surplus honey this season until Aug. and Sept., when the bees did extremely well. The brood departments of my hives are very heavy with honey now, which, in my opinion, will lessen their chances to winter, if we have a long cold one. My swarm on scales lost 1¼ lbs. in November.

My success in wintering two years ago has been given in GLEANINGS. One year ago I lost one out of 105. That swarm lost its queen early in the fall, and therefore failed before spring. F. C. WHITE.

Euclid, Cuy. Co., O., Dec. 6, 1882.

I believe your experiment was properly made, in transferring eggs, friend W., for the result is always as you say, so far as I know. A worker egg produces a worker, no matter what cell you put it in, and a drone egg produces a drone, no matter what kind of a cell you put it in. When bees make a worker egg produce a drone they enlarge the cell, it is true; but they do something else also; that is, if they ever do make worker eggs produce drones.

#### \$100 FROM ONE COLONY, ETC., AND ALL CARED FOR AFTER NIGHT AT THAT.

Last spring I had 26 stands of bees, and now I have 47 from natural swarming. I had one hive that swarmed 6 times, and made enough honey to do them, except one hive, and that one I shall have to feed. All the swarms came from 9 hives. From the queen I got of you a year ago I have now 24 hives. That colony that swarmed 6 times made 100 lbs. of surplus honey, worth 25c per lb.; 5 colonies at \$15.00 apiece is worth \$75.00; that would make bees and honey both \$100. I think that will do very well for an A B C scholar. We extracted 76 gallons of honey, and I took 260 lbs. of comb honey. Honey here is now worth 25c per lb. My fall honey, I did not get to take any of it, as I was taken sick. All the honey was capped. When I began in the spring the bees had no honey. I was feeding all of them at the close of the season. They averaged over 100 lbs. to the colony. I make all my hives nights, as I work in the pattern shops of the B. & O. Railroad Co. I tend to my bees nights and mornings. I put all of my second swarms back, which numbered about 25, except 6 swarms from the large hive.

JOHN N. CARROLL.

Grafton, W. Va., Dec. 5, 1882.

Pretty good, friend C.; but it seems to me you have figured the 5 swarms pretty high, at \$15.00 each. You ought to have some of the new bees that swarm after dark, and then, you see, you would be all right.

## THE REASON FRIEND GIBBS IS "HAPPY."

Bees did well with us the past season. I had 35 colonies in spring; increased to 72; shipped 4100 lbs. of comb honey,  $1\frac{3}{4}$ -lb. sections; about 20 gallons of extracted. Quite a lot of rough and unfinished sections sold here at home that would not do to put in cases, say 300 lbs., and then we eat it three times a day the year round. I have no idea how much we do eat. But I will make the report: 4100 lbs. and 300 lbs. makes 4400 lbs., for which I am thankful. I have made bee-keeping a success. Since I commenced, 5 years ago, I have not had a reverse. I winter in cellar every time, and lose none. I may lose them all this winter; can't tell; if I don't, you may hear from me in the spring.

## BLACKS.

Blacks are not worth keeping, in my opinion.  
Lyndon, Ill., Dec. 21, 1882. E. P. GIBBS.

## THE QUEEN THAT CAME HOME AFTER BEING SOLD, AND BROUGHT HER NEW FAMILY ALONG.

I commenced last spring with ten colonies, 3 of my own and 7 that I took to keep for half of the honey and half of the increase; 4 of the 7 were very weak in the spring. I increased the whole by natural and artificial swarming to 32; one went to the woods; bought one swarm in swarming-time, another late this fall. I divided the bees I took on shares. I go into winter quarters with 20 of my own, all in good fix, 10 packed in chaff, and 10 packed in very dry sawdust, all on their summer stands. I got about 260 lbs. honey, mostly extracted, and sold nearly all at 25 cts. per lb. I could not begin to supply the demand. I sold three queens; one for a dollar, and 2 hybrids at a quarter a piece. One of the hybrids was a very prolific queen. I introduced her for a neighbor into a small nucleus; she stayed about a week, filled up all her empty combs, and then came home and brought a part of the swarm with her. She went right into her old hive. I had put a young queen in the hive several days before she came back; it being Italian it was easy to tell which was killed. The Italian was soon brought out, with 6 or 8 bees clinging to it. I took it away from them. I then thought her a little too smart and good to kill or sell again, so I just let her alone.

L. HAINES.

Moons, Fayette Co., O., Dec. 13, 1882.

## MY REPORT FOR 1882.

Basswood did not open until July 25th, being about 12 days later than usual, and closed Aug. 6th. We had about 7 days the bees could work on basswood, the rest being wet and cold. On the 12th of Aug. I have the honey season marked closed, when I took my sections all off, with but few sealed up as they should be. On the 18th, I thought the bees were working hard; and on the 20th, while looking into some hives, I found them chock full of honey; so I went for the extractor, and put on my unfilled sections, and the result was, I got my sections all full and sealed up nicely, and quite a lot of extracted. On summing up my season's work I find I have taken 565 lbs. of extracted and 475 lbs. of comb honey, making in all 1040 lbs., or an average of 104 lbs. per colony. I sold my comb honey at 20 cts. per lb., and extracted at  $13\frac{1}{2}$ c. I increased to 22 good strong colonies and five nuclei, which are all in good condition for winter. I also raised 23 fine queens.

## PERFORATED ZINC; KEEPING THE QUEEN OUT OF THE SURPLUS-HONEY APARTMENT.

On page 440, Sept. GLEANINGS, the question is asked, "Are we going to need Jones's perforated zinc?"

I used Jones's perforated zinc sheets on top of hive (between hive and super) for extracted honey, and found it to work to perfection. I could not see any difference in the amount of honey stored in those that had the zinc on, and those that had not; but in every hive that had not on the zinc sheet, the queen went up into the supers and laid. I also used the perforated zinc to keep the queen out of the sections while at the side of the hives (as I work on the plan of side and top storing); but for the sections on the top, I used the Heddon honey-board, and I might say I had no trouble with the queens laying in the sections.

JOHN MYERS.

Stratford, Ontario, Can., Dec., 1882.

Friend M., I am very much obliged indeed for your report in regard to the use of perforated zinc in place of, or as a honey-board. Many questions have been asked as to how it would answer, but we have had heretofore but few direct reports. As to the cost of these, we have just imported a very large lot of zinc from England, and can offer sheets, right for Simplicity or chaff hives, at an even 25c each.

## THE DARK SIDE OF BEE CULTURE, WITH A SMALL "CRUMB OF COMFORT" THEREIN.

The past has been the worst season for honey in the Cumberland Mountains ever known. From what information I can obtain, 50% of all the bees wintered last winter are now starved to death. Directly after I wrote you in August, the bees began swarming out, and many of my largest stocks with most prolific queens deserted their hives, leaving their combs without honey or brood, a prey to the bee moth. The aster, the greatest autumn honey-plant of these parts, gave but light stores for winter — so light that I doubt if more than 10% of the bees will winter over, even of those that survived the summer.

## THE "CRUMB."

I know of but one thing to console us bee-keepers in a poor season like the past; and that is, that all stock not endowed with the greatest endurance and capacity for collecting honey is destroyed, leaving nothing but the best to propagate from.

DANIEL KEPLER.

Chattanooga, Tenn., Dec. 11, 1882.

Friend Kepler is an Ohio man, who moved where he is now with a view, I presume, of getting a better locality. Well, although the above looks rather dismal I would, under no circumstances, advise anybody to let bees starve. Past records show that they may have the very best kind of a honey-yield next season, and we should, therefore, hold on to the bees. Where no honey is taken away from the bees, and they are not interfered much with, his crumb of comfort may work; but I do not believe I would recommend that plan very strongly, as a means of selecting the best stock.

## I DIDN'T "STEAL 'EM."

I have read GLEANINGS for four years, and, as I say, I did not steal it (as my name does not appear on your book). I exchanged the *A. B. J.* for it with a neighbor, up to last Jan.; but his bees all died the winter before (1880 and '81), so he stopped taking it; so I must have it, and inclosed you will find the \$1.00.

Bees have done well in this part of the country (North Illinois); that is, the last half of the summer.

It was very well the first half; the fall crop was not large; we get no honey from buckwheat, or next to none, in this part of the country. Sweet clover fills the gap between white clover and fall flowers. Basswood comes in with white clover, but bees will always leave clover for basswood. Heart's-ease is the best fall flower we have, and the nicest-flavored honey I ever ate.

We also have a flower that is called blue vervain that yields some honey, but I have not had enough to test its qualities. But what I would impress on every bee-keeper is the necessity of sowing seed for bee pasturage, for the streets and roads are full of noxious weeds that could be replaced by honey-plants, and I am pleased to say that the bee-keepers of this vicinity are alive to the fact that we must plant to fill the gap between white clover and fall flowers. I would recommend sweet clover, catnip, and motherwort as the 3 best honey-plants for this section of country.

D. L. WHITNEY.

Rockton, Ills., Dec. 10, 1882.

#### FRUIT-TREES FOR "HONEY-PLANTS."

I see in last GLEANINGS an advertisement of one of our friends away down in Tennessee, offering, at a very fair price, fruit-trees; but he is too far south, I think, for his trees to grow up here in the spurs of the Alleghanies. But will not some of our friends who have nurseries, and would be willing to ship orders of 20, 25, or 50 trees, as many as one or two farmers would want, please stand up in GLEANINGS (alongside of friend Doolittle's man), and tell us where they live, and their prices, etc.?

S. M. HUMPHREYS.

Richardsville, Jeff. Co., Pa., Dec. 25, 1882.

Surely, friend H., your wants can be supplied near home, unless I am much mistaken. Who will give us a brief little advertisement of fruit-trees?

#### A TIN DIPPER IN LIEU OF A FOUNTAIN PUMP.

Last year I was at work for a farmer who had a few colonies of bees. One day we were told the bees were swarming. We hastened to prepare a hive, but before we had it in readiness for the bees we found, to our disappointment, they were on the wing. I immediately started for a pail of water to sprinkle them. My employer said it was of no use; but I meant to try. I did try in good earnest, for they started over a creek, and I managed to shower them nicely by the aid of a dipper. It caused great mirth among the other members of the family, to see me get so wet; but I was soon rewarded by seeing them safely landed on a low bush. So you see how just a little information saved a fine swarm of bees, and led me to investigate the mysteries of bee-keeping. My father and I took two swarms of a friend, and now they have increased to eight swarms, besides the large quantities of honey we have obtained.

J. C. YORK.

Brookfield, N. Y., Dec. 4, 1882.

#### FROM 18 TO 54, AND 600 LBS. OF HONEY.

Last spring I started with 18 colonies and increased to 54, and I obtained some over 600 lbs. of honey, mostly extracted; and next season I shall have to handle about 94, if they live through the winter. I have packed mine in chaff. I use the Mitchell hive. To-day, the 22d, the bees had their last pleasure in flying around in the air. We had very cold weather here — 20° below zero for two days.

Ligonier, Ind., Dec. 22, 1882.

J. C. MISHLER.

#### HOW TO MAKE LABELS STICK TO TIN.

I notice on page 187, April No., 1881, you recommend your readers to have their labels go around the cans, to make them stick fast to the tin; but what shall they do when the labels go but part way round? Well, after considerable trying I hit on a plan, which is as follows: I take borax, 1 part; shellac, 2 parts; dissolve the borax in boiling water, then the shellac, until it is about as thick as mucilage; now if you put this on your label, and the label on the can as you naturally would, without any further manipulation, it will, when dry, be sure to peel off; but if you just rub the label backward and forward a few times on the can with the palm of your hand, after the manner of making a glue joint with two boards, it will stick so fast when dry that you can't pull it off.

JOSEPH MASON.

Wallace, De Kalb Co., Ill., Dec. 2, 1882.

#### FRIEND LOVEJOY PLEADS "NOT GUILTY."

In Dec. GLEANINGS, Mrs. T. M. Squire says she thinks R. Lovejoy, of Greig, missed it in letting those colonies of his starve in the spring. You also gave me a little sermon in July or Aug. GLEANINGS, in which you said any man who does not take care of his bees ought to lose them, and he must not find fault if God does take them, or words to this effect. Now, in justice to myself I wish you would insert this. I have kept bees five years, and never had but two swarms starve in the whole time, and I will own that I am ashamed of starving even those two.

DYSENTERY CAUSED BY UNTIMELY DISTURBANCE.

I think the cause of my losing them was, First, I had to move them out of the cellar two weeks earlier than I ought, and move them one mile on a wagon, which gave them a good shaking-up, and of course excited them a great deal. When I put them into the cellar they numbered 53 strong; and when I moved them out, about the middle of April, I put out 49, all in good shape but one, and that one died of starvation before I got them all moved. Of the 4 I lost in the cellar, two were killed by mice, and two died queenless. Out of the other 15 which died of spring dwindling, I saved 37 combs 11x12, and most of them were full of good sealed honey; so you see they did not starve, neither did they die by any neglect of mine, but they would fly out and get chilled. The trees and fences were covered with them, and the Italians died off worse than the browns or blacks.

R. P. LOVEJOY.

Greig, Lewis Co., N. Y., Dec. 18, 1882.

#### A BEE-MAN IN TROUBLE, AND HOW TO HELP HIM.

I will send you a pair of woolen socks for a sample, to see whether you could use them. May be I have told you before, that I had a sunstroke last harvest, a year ago, so I am not able to do any thing outdoors since that, and not much in the house. I was not even able to tend to my bees this summer. It was nearly three months this summer that I was not able to walk out to see what they were doing; but they did well enough for the attendance they had. I got about 150 lbs. of surplus honey from 3 colonies, and increased to 5, so I got a knitting-machine, and work a little at that to make a living. They are paying me \$4.00 a dozen in the stores here, and in one store \$4.25; but they can not use them as fast as I can knit them, if I am able to work at it. So I thought I would give you an offer, whereby you could sell them at 35 cents (they sell them at 45 here). I would let you have them at \$3.50 per dozen pair.

They are all wool, and the very best yarn that goes; so I hope you will try to do something for me, while it is all that I can do.

C. P. IMHOFF.

Paradise Hill, Ohio, Dec. 16, 1882.

Now, friends, if any of you want a pair of woolen socks, here is a chance to get them, and help an afflicted brother at the same time. Those sent us are very nice, and I find that the postage on them will be only 4 cents; so all you need to do is to tell friend I. how many inches of "understanding" you have, send him 40 cents (you see this will give him one cent to get a stout wrapping-paper with), and he will just make them for you to order. I always like to help one who is trying to help himself, and I shouldn't wonder if we might make his heart glad before he hardly knows it. Let us watch for his report from the stocking business, next time we hear from him.

#### COMMENDATORY.

I am much pleased with GLEANINGS, as there is so much in it that is instructive to the bee-keeper, and those instructions are so plain they are generally easily understood. I must say, that I do commend "Our Homes;" that is, the spirit manifested, and trust it may be productive of much good.

OTHERWISE, AND SOMETHING ABOUT THE TOBACCO COLUMN.

It is no doubt very commendable, the spirit that prompts you to offer a smoker to those who stop the use of tobacco; but is it not disgusting to read those communications, informing you they have stopped using tobacco, and apply for a smoker? If they were poor, and not able to buy, it would seem different. Would it not be well to give a lesson in "Our Homes" on cultivating a spirit of manhood, self-reliance, in opposition to depending on other's for what we can and should do ourselves,—especially to endeavor to do ourselves good in that which it is a duty for us to do, and not expect a sugar-plum because we try to be good children?

#### SOMETHING ABOUT "FRIEND."

Again, do you and some of your correspondents belong to the religious society of Friends? The oft recurrence of the word "friend" makes me fear that, unless you have a large supply of those six letters that constitute the word, that GLEANINGS, which has arrived so promptly this year, may fail, for want of type, to be ready to visit us as promptly as in the past; and — well, I don't know what would be the consequence. No disrespect to Friends is intended. I can trace my ancestry on my father's side, unbroken, to the time of George Fox, members of that society.

D. BINNS.

Addison, Lenawee Co., Mich., Dec. 15, 1882.

Friend B., I do try to encourage a spirit of independence and self-reliance; but perhaps I have not dwelt enough on it. There are many men of many minds, you know, and what would have no effect on one would, may be, take right hold of another. I do not think it is the value of the smoker, but rather because it serves as a sort of binding of the contract, just as a man pays ten dollars down to bind the bargain, when he decides to buy some property. After the smoker is received, the receiver is in honor bound. One writer in this number, as you will see, sends me a dollar; and some time ago a good friend who thanked me for get-

ting him to leave off tobacco, sent me a set of studs and buttons made of solid 18-carat gold. Meanwhile the work goes on, and more and more are giving up tobacco, as you will see by reading their letters.—I know I use the term *friend* quite often; but I don't think I use it unless I really have a friendly feeling toward the one I am addressing, and desire to have him feel the same toward myself. Oftentimes what I have to say might be taken unkindly, were it not for this little prefatory word, and I am sure the readers of GLEANINGS all know that I never use it unless it comes sincerely from the heart. If I am a Quaker, it is in spirit.

#### WHY FRIEND POTTER HAD THE BLUES.

Friend Root, I see from GLEANINGS it is fashionable for all bee-keepers to make a report to headquarters, so I shall endeavor to make a short one, and on a small scale. I commenced in the spring with 2 stands of hybrids, and increased to 9, and lost one swarm, all natural swarms; I took about 200 lbs. comb honey, and sold 3 stands for \$21.00, and have 6 stands fixed up snug on summer stands, and well packed with straw; so I am not a fit subject for Blasted Hopes. But I had the blues once pretty badly when I undertook to take some of their honey, for the little fellows took it into their heads to have a spree, and I tell you they made it lively for 2 or 3 days. They cleared the yard of chickens, dogs, and every thing that undertook to cross the yard. They made me take to brush twice before I got the honey. I went at them with my little smoker, and that only made them more hostile, and I had to put on my screen and tie up my hands with gloves and rags so they could not reach through, and had to make a smoker by taking an old pot with a good bed of coals, and then piling on weeds and wet chips, and that made a smoke like an engine, before I conquered them. Now, friends, you say in GLEANINGS you can work with any bees, and hardly ever get stung. Now, I thought of you when I had that "brush;" and, not wishing you any harm, I would have given — a nickel to have seen you launch out among them. It is my opinion, you would have had to "brush" it, unless you had been well protected.

J. L. PORTER.

Pleasant Dale, Seward Co., Neb., Dec. 20, 1882.

It isn't well to boast, friend P.; for folks who boast, often turn out wretched failures. But I would certainly have given another "nickel" to have been there and shown you how I would handle those hybrids, without any "screen" or any thing on my hands or face either, and I think I should have done it with the aid of a 50-cent smoker, and nothing more. Experience does wonders in almost any thing, and it does wonders in handling bees. I don't believe I should have got stung at all, for I should not have tried to open their hive or take away their honey until I had got them so perfectly subdued that each individual bee would have folded his hands and begged pardon. May be I am mistaken; but it seems to me I could do it with any kind of hybrids. If it were a colony of Cyprians, I shouldn't feel quite so sure about it; but if you will let me have the management of them right along, I think I could handle them also, and not get stung.

## IS IT DYSENTERY?

I looked at a colony of bees to-day, and they are spotting the hive inside some. I do not know whether it is the first stage of dysentery or not. They smell a little strong for a clean healthy stock. It is in a chaff hive, but are packed on top of frames, or I wouldn't call it packed either. There are two thicknesses of burlap and one of carpet over them — the only one I fixed in that manner. They appear very lively. In half a dozen words, What do you advise? or am I making "much ado about nothing"?

## WHY DO SOME COLONIES HAVE A STRONG ODOR?

What makes some colonies have such a strong smell when they appear in good condition?

## MOLDY COMBS.

Do combs often have a kind of moldy appearance in the hive, in fall and winter? I take out one comb from each hive in fall, and spread in center for wintering in, and the combs stored away in other hives have a moldy appearance, as well as many among the bees. You can rub the combs, and nothing comes off to indicate mold.

I intend raising Italian queens next season. How early in spring can I begin, to be on the safe side? I would rather wait until swarming season, but I want them sooner, if I can get them good. Can I get two-thirds pure queens within a mile of a few colonies of blacks? Do you condense your apiary any for winter, or do you let your chaff hives stand just as they do in summer? W. M. YOUNG.

Nevada, Wyandot Co., O., Dec. 16, 1882.

I noticed one of our colonies spotting their hive around the entrance very early in November, after a heavy freeze; but to-day, Dec. 22, I find them all right inside, although the colony is rather weak in numbers. Their combs have the same blue or moldy appearance you speak of, but I have never found it to do any harm. A good strong colony of bees will have a rank, unpleasant odor unless they have abundant ventilation, and may be they will even then; but I am inclined to doubt it. In my greenhouse or cold-frame experiments, I found, by shutting off the ventilation, that the bees would soon fill the room with this strong rank smell, and finally spot the hives and furniture, if air were not given. I am inclined to think that plenty of air will do away with all the bad smell.—You can commence rearing queens when the bees are at work on soft maples, but you will have many discouragements and some bad luck that you will not have in June. The number of pure queens you will get with blacks near, depends on how many drones you keep in your own apiary. With lots of them flying daily, from almost every hive, you may get nearly all of yours purely fertilized, unless, forsooth, the black stocks all have thousands of black drones flying daily too. Don't you see how hard it is to give any kind of a definite answer to such questions, friend Y.? We never move our chaff hives at all.

## OUR IMPROVED FOUNDATION, ETC.

I have never reported on your new style of fdn., such as I had of you last summer. I must say, it far exceeds your old style, and is much quicker worked out by the bees, having no hard wall. I did intend to get one of the machines. I have a Given; but if you can furnish me the fdn., in lots of 100 lbs., at 10 cts.

per lb. over the price you pay for wax, as you did that lot ( $\frac{3}{4}$  was thin), why, I will just let you monopolize the fdn. trade, and buy of you.

Birmingham, O., Dec. 11, 1882. C. A. GRAVES.

That must have been a special rate, friend G., and we could hardly undertake to do as well now. While we pay 25c. for nice wax, we charge, by our price list, 43 by the 100 lbs. for ordinary fdn. If made thin for sections, the price would be 10c. more, or 53 cents. These prices will only hold so long as we can buy clear yellow wax at 29c.

## WHAT A YOUNG SCHOOL-TEACHER DID WITH HIS FIRST SEASON.

I am a young school-teacher, and an amateur in apiculture; and the results of the past season, although not as glowing as the results obtained by our professional bee-keepers, has made me an enthusiast in the science. I began last spring with six swarms, in fair condition; have increased by natural and artificial swarming to 22 good swarms, all in Simplicity and chaff hives, and I think in excellent condition for winter, on their summer stands. My honey product is as follows: Comb honey in 1-lb. sections and 4-lb. boxes, 884 lbs.; extracted, 249 lbs.; total, 1133 lbs. Average price per lb. realized, 16 cts.; total, \$181.28. Besides allowing each swarm eight combs, I find that I have 69 extra combs, partly filled with honey. My expenses were comparatively light, as being a carpenter myself I avoided one great expense by making my hives and getting every thing in shape during my spring vacation.

## ANOTHER OF THOSE "AWFUL HYBRIDS."

By the way, I must tell you what my "best swarm" did. It was hived June 5, and stored 297 lbs. in 1-lb. sections; 19 lbs. extracted, and an ample supply for winter. It was a hybrid.

I wish to get a foundation machine to make up my own wax. I will use all I have for sections. Now, do you think a 4-inch machine would answer my purpose? and if so, what machine would you recommend? D. E. STRATTON.

Bismark, Iowa, Dec. 11, 1882.

The 4-inch machine will answer all purposes, friend S., just as well as any other; and, in fact, it will, if any thing, make *thinner* fdn. than the larger mills; but you can make strips only 4 inches wide on it.—Your achievement for the first year is another proof that it is not so much age and experience that are needed to do well with bees, as it is real application and enthusiasm.

## MY REPORT FOR 1882.

We had fine weather the last of March and the first of April. The prospects for a fine honey season were never better than early in the spring. About the middle of April we had a freeze that killed the fruit-bloom. From that time till the first of June was very cold and wet. I continued to feed till white clover commenced blooming; then I united until I had them all full of bees. I decreased from 30 to 19 colonies, and quit feeding. I soon found that would not do, for my bees were starving, right in the height of white clover. I commenced feeding again, and continued to feed until basswood bloomed. They worked only three days on basswood, on account of a cold rainy spell. That 3 days' work, with what they could pick up from stray flowers, lasted them till

## BUTTON-WOOD

bloomed. There is a button-wood marsh only  $1\frac{1}{2}$

miles of me. My! what a rush they made every morning! and it continued until dark. They soon filled all the empty corners in the brood-nest, and went to work in boxes. The result was, that I soon had some nice button-wood honey. I think this was the whitest honey that I ever saw. As soon as that failed they went to work on red clover, and from that to buckwheat and blackheart. The honey season closed about the 15th of September. Increased from 19 to 26; got 50 lbs. honey per colony, spring count; half comb and half extracted; not a very good report, but I am thankful all the same.

#### SWARMING; CAN IT BE STOPPED?

Friend Hasty wished to heave a brick at some one for something that was not all O. K. I felt, last August, as though I should love to heave a whole hod full at the man who says you can control swarming by giving room in boxes, by extracting, or any other way that I ever tried, and I have tried every plan that I have heard of (except confining them in a dungeon), and some that I have not heard of, and failed; yes, failed won't express it. When the battle was over, and I had looked over the field, I found that I had lost three of my best queens; three colonies with virgin queens had gone to the woods. Next season I will try another plan, and report the result.

#### HONEY FROM WHEAT ONCE MORE.

I can not think that we need to have a frost to kill the wheat before it will produce honey; for three years past I have noticed bees working on wheat-stubble that was cut early. Some of our farmers think that wheat cut before it is thoroughly ripe, and stacked, will make nicer flour than if allowed to stand till ripe. (I am one of them.) In the early-cut fields is where I find the bees at work on a sweet sap that oozes out of the straw where it is cut off. It will last about two days. The bees will usually desert basswood to work on this sap, or honey. I can not tell what kind of honey it makes; the sap is as clear as water, and very sweet. I think it is the upward flow of sap to finish the starch of the grain, and is changed to glucose by the sun and air.

Whitestown, Ind., Dec. 20, 1882. S. H. LANE.

#### BEEES COMING OUT OF THEIR HIVES IN WINTER.

I have 9 colonies of bees, and I am being troubled with their coming out. They are facing the south, and at the north end of them I have corn fodder stacked all along, and between them I have straw. I have a covering of old carpet, and that runs over in front, below the entrance. I also have the second story of the hives, which are the Langstroth, filled with chaff; and every warm day they come out. To-day, which is tolerably warm, I see some bees out of every hive. What I want to know is, how I shall manage to keep them in. I want to know if it would do to cover the entrance with a wire screen. Those that are out to-day are around the hives, and seem chilled, and can't get back. GEO. W. CREE.

Covington, Ky., Dec. 21, 1882.

I don't think it will do any harm, friend C. A few bees will always come out, and not get back, probably of old age. Perhaps you may have packed them too closely, and they are too warm. *Never* fasten bees in their hives when wintered out doors.

#### WHAT MAKE OF FOUNDATION IS BEST?

By the way, have you changed your mind about fdn.? I thought you considered that made on your own mills as good, or better, than any other; but it

would appear from the report of the Michigan State Bee-keepers' Convention, that you now think the Given fdn. better. (See p. 793, A. B. J.) If the Given is best, I would rather have one of his presses, even if it cost a little more. A. G. WILLOWS.

Carlingford, Ont., Can., Dec. 16, 1882.

I did say, in substance, what was reported; but it was not *all* I said on the matter. All things taken into account, I would advise the fdn. made on *our* mills.

#### SECTIONS HOLDING ONLY ½ LB.

Do you intend to make ½-lb. sections for next season's trade? I intend to try the 4¼x4¼ sections about 1 inch deep; and I like your one-piece sections the best of any I have seen. If you make them of the size mentioned above, I shall be glad to buy of you. W. H. FRANCIS.

Frankfort, Mich., Dec. 20, 1882.

Friend F., I hardly know yet, what we shall make for a ¼-lb. section; but we will make the kind you mention, for \$4.00 per M., until further notice.

#### SHALL FRIEND E. GO OFF SOMEWHERE TO LEARN HOW?

I am obliged to request you to stop sending GLEANINGS. I have given up keeping bees in this locality, as it does not admit of a large apiary. It is with regret I have to make this request. I feel now just as though I should like to come over and work for you or almost any bee-keeper. I have had four years' experience. As soon as I can hear of any one who wants such a man, I think I shall be off, as I delight to work in the apiary.

A. L. ETHERINGTON.

Milton, Queens Co., Nova Scotia, Dec. 12, 1882.

Don't go anywhere, friend E., but just keep right on where you are, and you will succeed in due time. When you do, we shall be glad to have your subscription again. I have had experience, and I know. Read the report from beginners in the back numbers of your old journals.

#### WHAT FRIEND STRINGER DID WITH TWO HIVES.

I commenced the spring with two hives; I went into winter quarters with 12; got 200 lbs. of honey; sold 3 hives; put back 4 swarms, and 2 got away. How is that for an A B C? I made all the hives I used, except 2. Last spring my health got so poor I had to stop work at my trade, and do light work at the mill, and I put in ten hours every day. Well, my bees began swarming on the 8th day of May, and kept swarming; so you see it was not long until my 2 hives were gone. I made the boxes mornings and evenings, and nailed the frames together after night. Flora helped me some. I do not say this boastfully; but as I see others telling how hard they have to work to keep things in shape, I thought it would not be amiss. I see some had to get up as early as 3 in the morning to be ready to ship bees.

D. C. STRINGER.

Clinton Falls, Ind., Dec. 15, 1882.

#### BEVELING PLATFORMS FOR BUZZ-SAW TABLE.

Please tell me how you cut bevels or miters on your saw-table, described in last GLEANINGS. I should think it would have to be hinged the other way. It will not make Simplicity bee-hives, unless it saws miters or bevels. HENRY F. DOLSON.

New Paltz, Ulster Co., N. Y., Dec. 8, 1882.

Why, my friend, if the saw-table were

"hinged the other way," you see that the saw could not have free play. We have a temporary beveled platform which can be screwed to the table when desired. A description of this saw can be found in the A B C book.

#### A "FRIENDLY" LETTER.

*Friend Root:* — How natural it comes to say so! for I fancy every bee-keeper recognizes you as a friend the first lucky day he gets hold of GLEANINGS.

That is just exactly what I want him to do, friend Y.

Will you set your type-writer at work to answer a few questions?

#### HONEY-PLANTS FOR THE ROADSIDES.

What would you advise for the planting of waste places along the railway track? There are acres of such hereabouts in grass or weeds, and it seems a pity they shouldn't be covered with honey-plants.

For the purpose you mention, I think I would have Bokhara, or some of the other sweet clovers. I am told, however, there has been a strong protest in some of the States, by the farmers, because bee-men have sown sweet clover by the roadsides.

#### HORSEMENT IN CULTIVATION.

*Monarda punctata* — that's his name; he's the fellow I'm after; not for the railway, but for the garden. Can I get some seed, and hotbed it for a year or two, and perhaps acclimatize it even here, where your bee-hives get buried in a six-foot snowdrift? How would friend Carroll like that? Do you think it will hurt them — the snow, I mean? If it does, I can't help it; for I believe in chaff hives on summer stands.

Monarda, or horsemint, will grow anywhere, my friend, and I should not be surprised to see it thrive as well in Canada as it does in Texas. The great obstacle to its cultivation is, however, the rank, unpleasant flavor of the honey. If we could develop a variety yielding honey free from this objection, it would be one of our most promising plants. The more snow, the better; if I could be sure of having my hives covered with soft snow just as it falls, from fall until spring, I should hardly ask for any better winter protection.

If you were a beginner, and were a little nervous about your stock, whether they had enough to last them through, what would you do?

I would give them "Good candy," as directed in the Remindery of our Dec. No.

I had two colonies in the spring; increased to seven by division and natural swarming, lost the best swarm of the lot besides, and made over 200 lbs. of honey. Some of them, I know, have lots of honey; but some I am not so sure of.

But why did you not make sure of it, friend Y.? or, if you choose, why do you not make sure of it now? If I didn't know my bees had food, I rather think I should shovel off the snow and *s-e-c*, even if it is winter.

#### GETTING OUT THE WIDE FRAMES AND SECTIONS.

Friend R., why do you advise broad frames for sections? Bee-keepers don't swear, I know; but I am sure they sing sometimes when they have to pull ten of the "contraptions" out of a two-story hive, and scatter them all over the yard when they are getting down below, and have all kinds of trouble

getting the filled section out. It won't do; they are too much trouble. We must have something a good deal easier. Do you keep ½-pound sections? [Yes.]

Your whole trouble in getting the sections out of the wide frames is because you don't go at it right. New hands are often wanting a hinged top-bar, or something of that sort; but no old bee-man has any trouble in the matter. In the first place you must wedge up your wide frames, just as I tell you how in the A B C. If you just hang them in, as you do the brood-frames in the lower story, of course you will have trouble; for your bees will fill the whole right up solid with honey, just as they ought to do, and then four yoke of oxen (if you will excuse the expression) might be unable to pull them out, without pulling the frames and honey all to pieces. The right way is to put in your frames, and wedge them over to one side — your wedges, of course, being between the other side of the hive and the separators on the last frame. As the space occupied by the wedge is about  $\frac{1}{2}$ , of course no comb will be built in it; and when the hive is full, you can, by removing the wedge, have plenty of room in which to loosen and lift out your frame. After the frame is out, shake or brush off the bees; lay it down with separators uppermost, and then slip the whole frame from the sections; or, if only one or two are filled, take them out as directed in the A B C book. Now please bear in mind, all of you, if you just hang your wide frames of sections in the chaff hives, or Simplicity hives either, as you do the frames in the lower story, you will have lots of trouble, and may be more too.

#### B-E-E-S-W-A-X.

What shall we do for beeswax when the supply gives out? Do you think paraffine will ever take its place — in the brood-chambers, of course, for nobody is going to eat the stuff? Tell me truly.

If this Gatling battery of questions hasn't frightened you, we will expect to hear from you in January. Long life to GLEANINGS! can not do without it.

C. W. YOUNG.

Stratford, Ont., Can., Dec. 15, 1882.

I once gave my opinion as to what to do when we couldn't get beeswax; but some of the brethren almost "flew off the handle" about it, so I think I won't suggest any more. Paraffine is just as good to eat as beeswax, and a great deal whiter and cleaner. The worst trouble I know of with it is, that in hot weather it melts and lets the honey fall down. It is true, wires will fix it; but if I should advise *wires* in comb honey, I don't know but these same brethren would eat *me* up, instead of the paraffine, so I think I won't advise. At present, I think we shall have to scrape the surface of the whole earth for beeswax, and I think a silver knife will be about the best thing to do the scraping with. We are now offering 28 cents cash, and 30 in trade. Who will sell? Come again some time, friend Y.

#### HOW TO HAVE BEES THAT ARE TOO HIGH IN A TREE TO REACH.

Last summer I had a swarm alight on a large limb of a tree, 25 ft. from the ground. I could not climb very well, so I took a 16-ft. pole and tied a bunch of small beech twigs on the end of a pole so that the

bunch hung by the string. Then I tied a good-sized broom of asparagus tops, and tied them on a pole, and then went up on a ladder 13 ft. and held the beech brush over the cluster, and let the end of the brush rest on the bees, and then began to brush off the bees with the asparagus broom. In about 10 minutes I had most all of the bees on the bunch of beech brush, and brought them down and hived them. I have 8 strong colonies; have had poor luck this year; lost 12 out of 16 last winter; have not got a pound of surplus honey this year. Last year I got 1100 lbs. extracted honey from four swarms and their increase. W. A. E.

Easton, Wis., Dec. 22, 1882.

Friend E., that is substantially the way friend Shepard's swarming-box is used, and I think a peck basket, or any similar thing, would do as well as the beech foliage.

#### GETTING SUBSCRIBERS AT A PUBLIC SALE, ETC.

I could not have got 10 subscribers if I had not gone to two bee sales. Mr. Hastings, who died some time ago, had about 55 colonies; they averaged about \$6.00 in single 8-frame hives, but are in poor condition. Mr. Elys averaged \$8.64 in same kind of hives—only part 10-frame, and in good condition. The extractor that you sent him last spring gave good satisfaction, and the observatory-hive you sent took first premium at our county fair, with an Italian queen and some of her bees. We consider you a "square man" at this place. E. S. ELLSWORTH.

Lawn Hill, Iowa, Oct. 18, 1882.

## Notes and Queries.

#### FROM 15 TO 40, AND 1600 LBS. OF HONEY.

**B**EING an A B C, I suppose I ought to report progress. Last fall I had 15 stands of bees; this spring I had 15 stands. During April and May I fed \$15.00 worth of sugar. Between dividing and natural swarming I now have 40 stands put into winter quarters. I took a little over 1100 lbs. in 1-lb. section boxes, and a little 500 lbs. extracted honey. P. DIEHL.

Davenport, Scott Co., Iowa, Dec. 22, 1882.

GLEANINGS makes such a capital "silent partner" that I can not do without it. CHAS. R. THOMPSON.  
Ft. Omaha, Neb., Nov. 9, 1882.

I commenced in spring with 19, and increased to 40; doubled back to 37; got 700 lbs. honey.

MADISON TALBERT.

Morristown, Ind., Dec. 11, 1882.

#### THE 35-CENT GLASS PITCHERS, FOR HONEY.

Those last pitchers you sent are splendid. They hold just 4 lbs. of honey, and I sell them for a dollar, honey and all. C. FOWLS.

Oberlin, O., Nov. 4, 1882.

My report for 1882: I began in the spring with 17 hives of bees; got 1050 lbs. of extracted honey, 200 lbs. of comb in one-pound sections, and increased to 33 hives, all in Langstroth hives, in good order.

WM. COLEMAN.

Devizes, Ont., Can., Dec. 19, 1882.

#### MY REPORT FOR THIS YEAR.

I started in spring with 14 colonies; increased to 37, all in good condition for winter. I have sold 800 lbs. of comb honey; have 200 lbs. on hand yet. Nearly all sold at 20 cts.; had a hundred dollars' worth of fun. E. W. PITZER.

Hillsdale, Mills Co., Ia., Dec. 18, 1882.

Some thief stole the honey and spoiled a good stand of bees for me, containing a Holy-Land queen, one night this week. J. M. EPPERSON.

Moberly, Randolph Co., Mo., Dec. 10, 1882.

AN ADDITIONAL HINT ON THE STATISTICS MATTER; SEE PAGE 26.

Let each bee-keeper send in the report of any other bee-keeper who does not send in his own report. C. C. MILLER.

Marengo, Ill., Dec. 18, 1882.

From 100 colonies the season past, we took 4500 lbs. of comb honey in one and two pound boxes, which has nearly all been sold at 20 to 25 cents. We took no extracted honey. By artificial swarming we obtained about 30 new colonies.

OLIVER M. BROWN.

Winchester, Va., Dec. 19, 1882.

I have about 200 combs in frames  $8\frac{1}{2} \times 18$ . I want to change to the L. Now, must I transfer the combs, or must I melt them and have fdn. made of them? They are drone combs. I got 70 lbs. to hive, and increased from 42 to 70. J. W. BRADLEY.

Columbia, Boone Co., Mo., Dec. 5, 1882.

[I would melt them, if drone comb, unless you can use them in the upper stories for extracting.]

#### TROUBLE AHEAD.

Bees are not wintering very well; they keep coming out in cold weather. They appear to be swollen, and have no power to fly; plenty of honey to winter on. If they continue at the rate they are coming out now, there will be none left by spring. Some are in chaff hives, some in straw hives, same as chaff hives. All are in double-walled hives.

Chardon, O., Dec. 18, 1882.

CARLIE COWLES.

#### RATS AND MICE, IN BURYING BEES.

In Boomhower's way of wintering bees, what prevents the rats and mice getting into the hives when he sets them on the scantling, without bottom?

WILLIAM C. HOLMES.

McCartney's X Roads, Mo., Dec. 13, 1882.

[If the bees are buried some distance from any house, it is not very likely that rats or mice would ever find them, if I am correct. Will the friends who have buried bees, say if I am right?]

#### DYSENTERY; SYMPTOMS ALREADY.

I have 33 strong colonies of bees, with plenty of honey in chaff hives, but they already have dysentery badly. If they were yours, what would you do with them? S. F. NEWMAN.

Norwalk, O., Dec. 21, 1882.

[I don't know what to do, friend N., but to give them more ventilation. Put only two inches of chaff over them, or a single sheet of coarse burlap. I would also feed "Good candy," as directed last month.]

#### FROM 115 STANDS TO 200, AND 12,050 LBS. OF HONEY.

I commenced in the spring with 115 colonies, all except two in fair condition; took 12,050 lbs.; 500 comb, the rest extracted; increased to 200 colonies, and am satisfied. The spring was poor; but after the honey-flow started there was no let-up until frost. GEORGE BRIGGS.

New Sharon, Ia., Dec. 19, 1882.

[Friend B., that is what I call "business." I presume all were in one locality, though you do not say so. Over 100 lbs. each, from an apiary of over 100 colonies, is worthy a man's best efforts.]

## SILVERHULL BUCKWHEAT.

I raised on five acres, about 80 bushels, on a gravelly, yellow-sand soil. It kept over 100 stocks of bees busy during its season, and they stored considerable surplus. The honey is not nearly so dark as old kind.

S. C. PERRY.

Portland, Mich., Dec. 8, 1882.

How many cubic inches should an average swarm of bees cover at zero weather?

C. H. BOYD.

North Monroe, Waldo Co., Me., Oct. 6, 1882.

[A rather hard question, friend B.; but I will hazard the remark, that I think a good colony can pack themselves in a sphere not over 6 inches in diameter. What do the rest think?]

A friend from Illinois sent me last September two queen-bees, with directions to put them in. I thought it would kill me, but I did it quite well. I now have considerable faith in myself. Both hives are sending out quite a number of yellow-banded fellows.

GEORGE W. WARNER.

Grass Valley, Cal., Nov. 26, 1882.

Although we had a very gloomy outlook for bee-keeping in May and June, we have had a very good honey crop here this season. I started in the spring with 35 colonies, which I had to feed through May and June; increased to 70, and gave nearly 2000 lbs. comb honey, 2000 lbs. extracted.

J. A. OSBORNE.

Rantoul, Ill., Nov. 27, 1882.

I began the season with six swarms of black bees and two nuclei of Italians; increased to 17 swarms, and took 1100 lbs. honey in boxes and two-pound sections. Bees are in Langstroth hives in open shed, packed in straw, with chaff cushion over frames for winter. This has been a fruitful season for honey.

Sigmourney, Ia., Dec. 18, 1882.

L. MCCOY.

## SWARMING BY MOONLIGHT.

In last GLEANINGS you speak of night-swarming as new. The late Mr. Moon had a case once. I speak of it in *Manual*.

A. J. COOK.

Lansing, Mich., Dec. 15, 1882.

[Thanks for calling to my notice swarming by moonlight. I had overlooked the fact that you mention it, friend Cook.]

Here is my report: Commenced in spring of 1882 with 4 colonies; got 400 lbs. comb honey, mostly in 1-lb. sections, and increased to 11 good colonies. The fore part of the season was very wet and cold, and bees had to be fed through May. Most of the honey obtained was from smartweed, of very fine quality.

W. SHIELD, 11.

Muscatine, Iowa, Dec. 8, 1882.

## BLACKS, HOLY-LANDS, ITALIANS, AND CYPRIANS.

I weighed the honey from four hives; black bees, 120 lbs.; Holy-Lands, 188 lbs.; Italians, 205 lbs.; Cyprians, 225 lbs., all extracted honey.

J. W. UTTER.

Amity, Orange Co., N. Y., Dec. 11, 1882.

[You see, friends, the Cyprians do *sometimes* get honey any way. Friend Utter has had a wonderful yield from all of his bees.]

## GOLDENROD, THE EARLY VARIETY.

I see by Oct. No. of GLEANINGS, that J. H. Peirce, of Dayton, O., asks about the early variety of goldenrod that blossoms in July. We have this early kind here. It commences the last of July, but we never get honey from this early variety. We never get honey from goldenrod till the 10th of Sept.;

JAMES B. MASON.

Mechanics Falls, Me., Nov. 2, 1882.

**Blasted Hopes,****Or Letters from Those Who have Made Bee Culture a Failure.**

I HAVE been a subscriber since your first number was issued, but did not think ten years had passed since that time till I looked on the cover of the December number. Put me in *Blasted Hopes*, for January, as my report would be 100 colonies in fine condition in spring; from them, 6 swarms and 350 lbs. extracted honey, which had to be made up in the fall with sugar. Bees lived on pollen and water while clover and basswood bloomed.

J. C. THOM, M. D.

Streetsville, Ont., Can., Dec. 6, 1882.

Friend T., you ought to be thankful for doing as well as you did. You did not gain anything, it is true; but you are prepared for winter, which is better than some of your fellow-workers have done. Isn't it?

## IMPORTANCE OF HAVING SOME OTHER OCCUPATION THAN BEES.

Another year has rolled around, and yet no honey, and only a few bees. I had 25 in the spring, and increased to 40; but the season was so poor that they did not gather enough for winter, so I had to double up till I had only 30. This was the poorest honey season here for many years. No bee-keeper got any surplus honey in this section; but I have seen some good reports in GLEANINGS from Ohio. How can it be that in so short a distance as that, one place is good and the other poor? White clover was abundant, and lots of other flowers. I thought I should do a good business with my bees this summer. They were in good condition in the spring. I made preparation to give them my whole attention; but if I had had to depend on my bees only, I should not have made a cent. But I have a small farm that gave me some pocket money; therefore I would advise all bee-keepers to do something else besides keep bees, for I think it is an uncertain business. But nevertheless, I stick to the bees. In the spring, when I set my 25 colonies out, I felt "kind o' proud." I thought I should soon be up to fifty. Well, then I got a kind of bee fever, and it grew worse till the last week in May, when I got a big "dose" of "bee powder," which checked it for another year. The "dose" was, that the bees began to kill the drones off; they just slaughtered them. I opened a few hives, and some had not a drop of honey, and but little brood; so I had to feed.

[Name and address to above, lost.—ED.]

As a rule, I do think it best for a bee-keeper to have some other means of supporting himself. I would especially give this advice to those just beginning. After you get to be an old hand at the business, and have enough cash laid up so you can afford to go through one season without any income, it might do to depend on bees alone; or, perhaps I should say, honey alone. At the present prices of queens and bees, I think a bee-keeper of experience could make a good living selling them alone, even though he had to feed every month in the year; but to do this he must not be cramped too much for capital, nor can he make many mistakes through inexperience or heedlessness. A little farm is a very good thing indeed to have, when honey happens to be slack in coming in.

## Our Homes.

For dust thou art, and unto dust shalt thou return.—GEN. 3:19.

**D**ID I never tell you that we have been, for almost a year past, planning and building a new home? Well, we have, though; and now if you were to look over a little beyond the apiary, right about where the artist has tried to picture the sunflowers, you would see a brick edifice that we are just beginning to call our home. We didn't mean to build so expensive a house, but it "sort o' grew," you know, as such things often do. After we sold our old home last spring, Sue and I talked it over, and agreed that we wanted just a modest little home; but at the same time, as there were now six of us all together in our family, we thought it better to have it large enough so we should not be cramped and crowded, even if some of our real particular bee-friends should make one of our family circle now and then. So we sent for an architect, and began planning. There should be a room for each one of the children, to care for and keep clean and tidy, and free from "dust;" and then we wanted a woodhouse, a kitchen, a pantry, a dining-room, a sitting-room, a parlor, and a parlor bedroom, and then we should be just comfortable. As it was to be the only house we should probably build in our lifetime, we wanted it good and strong. We wanted it made so it would not have to be tinkered and fixed up every spring, and so it would not very soon decay, and need to be renewed; for you know it is often cheaper in the end to have a good thing, even if it does cost a little more. I very soon decided that it wanted to be of stone and brick, with a slate roof; but Sue consented only reluctantly to the force of my logic. We had to decide during the busiest part of the season, on many points; and as we did not want you, my friends, to suffer for want of supplies because I was having a house built, many important matters were settled with very little thought and consideration. I picked out a picture of a house in the architect's book, and told him to make it like that, only have it brick.

I presume many of the friends to whom I am talking have much nicer homes than ours will ever be, and perhaps some have those not quite as good; but altogether, I think I occupy about a middle place in the great sea of humanity. In many respects I know I am comparatively a country boy, and perhaps behind the times in many of the modern appliances and comforts of civilization. I used to feel embarrassed and troubled when I went out anywhere and exposed my ignorance; but I don't so much now; for when I am working hard, and trying to do right, I know I have my Savior's love; and why need any one feel troubled and be afraid, with the consciousness of the presence and nearness of such a mighty friend as he? Still, I want to be able to do as other people do, and I do not want to pain any of my many friends by a lack of proper pains in my dress, or the appurtenances of my

home when they come to see me. I feel pretty sure, as I think of it to-night, that many times I have not dressed quite as well as I should have done, for one in my station; and I fear, too, that I have given pain to dear kind Sue by objecting to little improvements she wanted to have made about our own home, where we two have passed so many pleasant hours together. I know she will forgive me, for she always does; but I was going to add, that I have almost all my life been guilty of a little fondness for being considered eccentric. I am sorry for it now, and I want to get over it. When I was a small boy I refused to wear a stand-up collar (as everybody else did), even at a sister's wedding; and no doubt I gave this same sister much pain by wanting to be excused from being present at the ceremony, because there was a "lectricity show" in town that same night. Well, I fear it was a remnant of the same defiance of custom that has prompted me to refuse to wear a necktie for several years past.

While at the convention in Michigan the matter came into my mind, and I took the trouble to look, and every brother present wore a necktie, except myself. I went out straight and got one, and for a few days back I have been quite in the habit of taking a look in the glass, when opportunity offered, to see if I presented an appearance that my grown-up son and daughter, and even other friends, would not feel ashamed of. I tell you, my friends, there is quite a number of us who can be better Christians by looking in the glass a little oftener than we do. God meant us to make ourselves pleasing in the eyes of others, so far as we can consistently. In just the same way, he wishes us to have pleasant and attractive homes.

The new brick house had a splendid cellar and an excellent foundation; and ere long I saw brother Munger, the boss of the mason-work, down in one side of the cellar laying a piece of nice smooth sawed flagging.

"Friend Munger, what is that for?" said I.

"This is for the ash-pit."

"What is an ash-pit?" said I.

I don't remember what reply he made, and very likely somebody wanted me over at the factory, so I didn't find out; but the next time I came around I found a small brick room, with a partition through the center, built on that nice smooth flat stone, and this was carried up to the room above. Over it was put a fireplace, or a place for a grate, and then a passage-way was also made into the room above, for a similar grate was to be placed there. The lower room was for the parlor, and the one above for the parlor bedroom. You see, the ashes would all fall from the fire into this nice fire-proof ash-pit in the cellar below; and instead of carrying ashes down stairs to be hoisted out into the streets to blow into people's eyes, and everywhere else, they just tuck themselves away down cellar into the pit, that will hold a wagon-load or more, from whence they can be carted out on to the land, or wherever wanted, once or twice a year, as need be. Not only does this avoid all dust or litter from taking up ashes, but the thrifty housewife, when sweeping the floor either in win-

ter or summer, need never use a dust-pan, for she can sweep it all right under the grate, and let it fall into the ash-pit, in the cellar. Still one thing more: Doctors tell us that no means of ventilation has ever been devised, equal to the old-fashioned fireplaces that take all the air in the room up the chimney with a rush and a roar, at the same time they dispense heat to the rosy-cheeked, healthy boys and girls gathered around. Whether a fire is burning or not, air is almost always going up the broad open chimney; and if one should be so thoughtless as to shut all the doors and windows when going to sleep at night, the open fireplace does its duty in bringing about a regular and constant exchange of air in the room. Stoves may do something the same; but the air from a heated room is not good. Don't I know? Listen:—

I have always a dread of riding in the cars when the weather is cold, for I am pretty sure to get a sort of sickness that has a kind of nightmare horror to it. When returning from the recent convention, during the zero weather in the fore part of December, I had a taste of it. As the stoves are what seems to be the offensive feature, I always get a seat in the middle of the car, if I can. I do not know whether they have tobacco spittle dried on all the stoves in cars or not; but I have sometimes got a way of imagining they do, and after I have breathed the peculiar burnt air they give off for about so long a time, I get poisoned, and sort of half-way crazy. Without being asleep at all, frightful dreams, as it were, run through my imagination as a sort of under current. If Satan and his allies are tobacco-chewers, and pass away their time in sitting around a rusty red-hot stove on which they from time to time squirt tobacco-juice,—well, if I were to go among them, I would rather not stay very long. One reason why the word Christianity is sweet to me, is because it seems to speak of pure air and clean people.

We arrived at Elkhart. The depot buildings were beautifully built, and are finished in hard wood, just as our new house is; but, oh what a place! Even in the ladies' room were great tin pans for spittoons, so full of green filth that matches and bits of paper were swimming around in it. The stove was red-hot and rusty, and gave off that same burnt smell. I went and stood in the open air, so full of frost that it pricked like needles, then I went back and sat down by the stove again. I presume these rooms see droves of tired travelers; for although I should judge the building was comparatively new, the floors, door-latches, and seats seemed worn by much and constant use. Money had been expended plentifully, but no one seemed to have charge of the rooms who was alive and thorough, or who had the spirit of Christianity at heart, to prompt him to think of the comfort of these neighbors who, perhaps, waited only one hour as I did in these waiting-rooms. May God help in this great problem of securing cleanliness and purity, not in our homes only, but for those who travel! I got on the train again, and the craziness commenced. Happening to glance toward the forward part of the car,

all at once it seemed to bend down, as if it were diving down into the ground. You need not laugh, for I have heard of people who saw the ground jump up and strike them in the face. But it wasn't any thing I had drank that made the cars start to run down into the ground. It might have been the effects of tobacco; but if it was, it was taken under a most emphatic protest. I raised a window and drank in the pure icy air; but it only partly answered, and made my neighbors uncomfortable. "Lord, help!" welled up from my heart, as it always does in any trouble, and a way was opened.

I shall have to make a little confession right here. A sleeping-car costs \$2.00, and it has seemed to me that a strong healthy man like myself would be acting selfishly in using that sum of money for such a short ride. You are sending me money freely, and I ought to use it wisely. I do not feel that I have any right to any better lodging or fare than the average bee-keeper of our land. The case was, however, a little different just then. I felt pretty sure, after my brief prayer, that almost any one of you would say, when the cars got a trick of "ducking" down into the ground, "Brother Root, go and get a sleeper; never mind the \$2.00."

You see, I had been away from home for three days, and there would be a "power" of work to be done when I got back, and if I didn't have my brains "at my fingers' ends" next day, it might cost me a good deal more than \$2.00. When I opened the door of the sleeper I was a little staggered to find myself in tobacco-smoke again; but back of this I came into an atmosphere that seemed like a spring morning compared to that where I had been. A good-natured porter, who wasn't patronizing, assured me that, no matter how far the mercury went below zero, no one would be uncomfortable in that car, which was a new one of the latest pattern. It was warmed with water-pipes; and while there wasn't a particle of dust, smoke, nor any kind of disagreeable smell, the air was as soft and balmy as summer. The bedding was as sweet and clean, and as well aired, as that in my own home; and in the retirement of my berth I could kneel and thank God, as earnestly as I prayed for help but a few minutes before in that suffocating car.

I awoke in the morning bright and fresh, with no trace of any unpleasant feeling or headache, even though I had been riding all night. As I was up before any one else, I had ample time to carefully note the conveniences of the wash-room while I leisurely made my toilet. If the combs and brushes had ever been used before, they bore no traces of it. After I had finished, the obliging porter asked me if I would not prefer to sit in the smoking-room. He didn't know me, and I didn't know him, you know; but after a while we both found out who the other was. When he found out that I did not like tobacco he pulled a knob in the wall, and out came the prettiest little seat you ever saw; and after it was out you couldn't see the place it came from either. While I sat on this seat, he "tidied up." After I saw how he did it, and the neat way in which he put all his things in their place, I began wonder-

ing how much one would have to pay a man who could take care of things thus. Why don't they have one in the station at Elkhart? It is because the money isn't forthcoming. That elegant car cost money too, and I presume they received a hundred dollars or more for the use of it that very night. Was it worth it? My part of it was worth the \$2.00 I paid, under the circumstances.

I know we are dust, and that to dust these bodies must return, and that is one reason why I believe in shaking off the dust that is so prone to accumulate, that the image of God that is in us may shine out for a light to the world.

A few years ago the dust in our saw-room became so oppressive to the hands working there that we purchased, at considerable expense, a blower to draw all the dust from the buzz-saw tables, and throw it in a room below, near to the grate under the engine-boiler. The man who furnished it happened to be present at our noon service. I explained to the hands what it was for, and its object, something in this way:—

"I would say, especially to the boys of our establishment, that Mr. Gray and myself have for some time been trying to devise a plan for getting rid of the dust in the saw-room, because we fear it will prove injurious to your health. The gentleman whom you see with us to-day understands how to do it, and I am glad to be able to tell you that a machine is to be sent us in a few days that will do the work effectually. Now, I want to say to the boys that there is something else that troubles me, even more than the sawdust. It is something I am more anxious about than I am of your health even. It is a kind of dust that will bring ruin, devastation, and death, not only to the body, but it will bring ruin and eternal death to the soul as well. What I allude to is markings of obscene words and pictures on the walls of our out-buildings. Now, if I go to the pains of having it all sandpapered off, and painted over, we shall surely have no more of it, shall we?"

The Bible says, "Blessed are the pure in heart, for they shall see God." Would any one ever want to see God, while such foul thoughts were in his mind?

The examination of that new sleeping-car has, as I think, been a good lesson to me. I often think of it in planning the arrangement of our new home. While thinking of it just now, I went and washed my face, combed my hair, what there is of it, and "adjusted my necktie." Do you not like to see old people neat and tidy? Well, if God is willing, you and I will soon be old people, at least some of us. If we can't all have expensive homes, we can at least look clean, and, as a general thing, have the dust all brushed from most of us. I have sometimes thought cleanly dressed children are more apt to be quiet in manners, and pure in their talk. I wonder if it isn't so with older ones.

I heard of an old miser who died a few days ago. On going over his premises, things were found just as they had accumulated for years back. Dust lay inches in thickness, and grain was found, bushels and bushels of it, that had been stored away for

years past. Though living, he was dead to business and dead to industry. It worries and frets me to see dust collecting anywhere. It is to me an emblem of death and decay. It indicates carelessness and neglect. Once in a while I find goods stowed away where they ought not to be, overlooked and passed by, nobody knowing they were there when wanted, and of course covered with dust. We found a lot of cans of honey in that shape this morning, covered with dust, and the labels faded, stained, and about as forbidding in appearance as they well could be. Have you any thing of that kind about your house that might have been turned into money just as well as not, months ago? Is that the way large business houses are carried on? To be sure, it isn't. Dust is a foe.

Saturday is usually a busy day with us. If it is during a muddy time, more or less Medina mud is tracked over the building by busy clerks. Sometimes I have occasion to pass through the building on Sunday. The deserted rooms look sad and lonely in their unusual stillness. They are cold, too, and chilly; and when one lays his fingers on a desk or counter it leaves a mark, for dust has accumulated in one short night. In the morning the room is warm, and a busy clatter is heard. There isn't any thing on the desks now that will leave a mark, for the women folks (they have been at swords' points with dust since the time of Eve, I believe) have been swinging their dusters around. Sometimes when I get weary I tell Sue I should like to go off in some great woods, and keep bees all by myself; but she quickly replies, "Now, you know you wouldn't like to do any such thing, for you couldn't live one day without a whole lot of boys and girls around you." and I guess she is right, after all. With them I have lived, and with them I shall fight against dust and decay, so long as God shall give brain and muscle.

A dusty store is an abomination; and dusty goods, shelves, and counters, will drive customers away, in spite of the inducements other things can offer. Honey in the most enticing cans, or packages of comb, won't sell, if you let dust cover it over. In the counter store we have some large stamped dish-pans, made without joint or solder, and retinned so they look almost as bright as silver. At the time the honey ran through that car I took one of the largest size, and used it to catch the honey. Before it was emptied and washed it got scratched, and its luster dimmed, somewhat; but it was hung up with the rest in hopes it would soon sell, so we could then hang up a new bright one. After several months had passed, and it didn't sell, although other sizes side by side were going off rapidly, I told Sue about it, and she said she would have that one, for it was just exactly as good to use. A new one was hung up, and they bought them so fast the whole stock was gone before I could get on more. Then, rather than have the place vacant, I hung up the dimmed one again.

Is the world to blame, because they insist on having bright clean shining goods? In one sense they are not, and I rejoice to feel

that now in this day and age there is a great call and cry for bright, clean, pure men and women. They are wanted unsullied or tarnished with any uncleanness. Dusty Christians are at a discount. Cleanliness and freedom from dust costs money nowadays. If you don't believe it, go into any of our cities, and try the cheap hotels and low-priced boarding-houses. I by no means wish to blame them; they evidently do the best they can under the circumstances.

To keep the dust brushed off requires more help, and it also requires more expensive help. The man or woman who can build a fire in three minutes, and not leave any traces behind, even to the keen sharp eye, costs quite a little more than that one who "don't know how to do any thing." Still further, cheap help is almost always help with bad habits. Men or women, clean in body and pure in heart are so eagerly sought for that you must pay a price for them. This is getting to be the case everywhere.

A remark was made a few days ago, that religion is now getting to be a thing of common sense, instead of senseless rites and superstitions. When one unites with the Church nowadays, everybody expects him to be clean. People are getting to think as did Solomon, the wise man, when he said,—

When thou vowest a vow unto God, defer not to pay it; for he hath no pleasure in fools: pay that which thou hast vowed.—Ecc. 5: 4.

When it comes to hiring a minister, we want him just like that dish-pan, if you will excuse the comparison. No dustiness wanted here. He must be clean and bright. "Not slothful in business, fervent in spirit, serving the Lord." Is it an easy matter to be a minister, and get, say, \$1500 or \$2000 a year? Not very, I tell you. I know pretty well what some of them do, and what they have to do. If you or I were held up before the broad daylight of public gaze and opinion, and expected to shine like the new dish-pan, with undimmed and "dusted" luster, year in and year out, we should break down and give up in the outset. How can one be expected to lead the bright trained minds of the present hour, unless he is up and dressed in all the arts and sciences, as well as the leading events of the day? He must not talk and make a parade, but he must live an honest, self-denying life, forgetting self while he is shaking the dust from the dusty crew all round about him. Not a speck of selfishness or weakness must be visible anywhere, and nothing must be left undone that falls within his province. His pure life must preach constant sermons, or those he delivers from the pulpit will be of little avail.

When I commenced to write these Home Papers I used to get somewhat disturbed by the letters that came now and then from those who said they had always learned to look out for those men who mix religion and business. I didn't quite feel like telling them that, although others might be insincere, I wasn't. In fact, that would be just about what the "others" had said also, if they were not sincere. I finally decided that it wasn't best to say much of any thing. I think I told one or two to wait a little before

they passed too severe a judgment upon my ways of doing things; and as they were mostly new subscribers who wrote thus, I proposed to return the money they had sent me, and leave them to pay or not as they chose, after we got a little better acquainted. After doing this I just made up my mind,—yes, and I prayed God to help me too,—to keep my character and reputation as it stood before the gaze of these critical ones, free from dust and specks. I made up my mind that, with God's help, I would try to keep just like that new dish-pan, just out of its paper wrappings. I don't mean that I did this to convince them they were wrong, nor because I wanted folks to stop and admire my "tinware." You know I did not, friends. I worked hard because the Bible I had learned to love said, "Blessed are the pure in heart, for they shall see God;" and while working and praying I did see God, and had glimpses of his great love for all who were trying to please him. I don't mean to say I made a clean record, for my best friends all know what bungling work I often made of it; but you saw I was trying, and God saw I was trying, and you and he both seemed to take the will for the deed, and you have all, and are now, wondrously kind to me. Since I have chosen Him for my shepherd, friends I have found without number, and that, too, even though I am but of the commonest dust.

Lest I leave the impression that we would advise everybody to have grates instead of stoves when building, I will add that, after the building was all up, after discussing the matter a great deal, we decided to have grates in each of the seven rooms. Although no provision had been made for them when the chimneys were built, except the one chimney already mentioned, we were told they could still be fixed so as to carry the ashes all down into the cellar, etc. It is done; but our mason assures me now that it would have saved me \$100 had I decided on this course at first, and had all the chimneys made accordingly. Furthermore, they won't burn any thing but soft coal; and when Sue's critical eye discovered flakes of black here and there around on the window seats, just recently painted and varnished so nicely, she has had a great longing for her old stoves that burned only wood, at the old home. I fear, too, she has had a pretty big longing for that old home, humble though it was.

The boys are home from college, and by accident proved to be the first occupants of the new building. Christmas day Sue went over and thought she would set their room to rights. Some way the ashes and coals had wandered almost all over the room; and before she got it all swept and dusted up according to her ideas, she got pretty tired and somewhat discouraged. The next day I went over with her, and, lo and behold! things were in a worse fix than the day before. Was the house haunted? The ashes had strayed out again, and even unburned coals were crunched into the new floor over a great part of the room. The paint was also knocked off from around the fireplace, as

if somebody had been shoeing horses in the room; and one might also have imagined the horses were young ones, and a bit uneasy too. If I remember rightly she cried a little, and I think I heard her telling Mr. Gray, that she would give a whole "thousand dollars" to have every grate taken out of the house, so it would be clean and new, as it was before they put them in. It happened that, instead of "colts," it was "Jacob," and the youngest one of the "Canadians," who spent their Christmas evening in the new house, and, not having had much experience in "dust," or coal fires either, they essayed to break a large lump of coal *before* they placed it on the grate. They have promised to "do so no more," and Sue and I knelt together that night and asked the dear Savior to give us faith that he could bring *good*, even out of those grates; and now, whenever "we children" want to bother mamma, or test her ability to look cheerful "under fire," we simply say "grates." Reader, is there any thing that you feel badly about at your house? Well, then you know how to pity us. May be we shall like the grates after all, even if they don't look as nicely as they would have done had we been wise, and had the house planned for them when it was made; and in any event we are going to try to put our trust in Him who said,—

Come unto me, all ye that labor and are heavy laden, and I will give you rest.—MATT. 11:28.

## Tobacco Column.

**I** HAVE quit using tobacco. I want no smoker; I feel more like giving you a smoker than asking one from you, so here is \$1.00 for you in place of a smoker. Bees have not done much here this season; the honey that we did get is dark and rather strong-tasted.

JOHN JOHNSON.

Malvun, Ont., Can., Oct. 6, 1882.

Well, I declare, friend J., you are a novelty, any way. May God bless you in your resolve; but I really don't know what to do with the dollar. Shall we not place it to your credit, against a "rainy day"? Seems to me things are getting upside down, or something when the brethren stop tobacco and then send me a dollar because they are glad.

You may place me in the Tobacco Column. My friends say I am entitled to a smoker. I needed one the past season. I have quit the filthy weed, and intend that part of the means spent for tobacco shall go to forwarding Christ's cause in the future.

M. A. DICKSON.

Brownsville, Ind., Nov. 16, 1882.

I have been a constant chewer and smoker for seventy years, until last fall, when I resolved to quit the use of tobacco altogether, and I have neither chewed nor smoked a particle of the weed since; and by the help of God I never expect to taste it again while I live. I did not ask you for the smoker when I quit, nor do I ask you for it yet. I thought it would be better for me to quit without any reward.

JOHN STEVENS.

Lynchburg, O., Dec. 3, 1882.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

MEDINA, JAN. 1, 1883.

He trusted on the Lord that he would deliver him.—Ps. 23:8.

AS wax doesn't seem to come in very fast, we will, until further orders, pay 25c cash, or 30c trade.

UNTIL further notice we will pay 10 cents each for March numbers of 1882. Put your name on the wrapper and drop us a postal.

AS wax is liable to advance, foundation will probably advance, and makers of fdn. wish it understood that the prices may advance at any time, without previous notice.

THE woolen stockings mentioned on another page can be sent from here, if more convenient, and where our friends are ordering goods, of course the postage can be saved. Price 35c.; if wanted by mail, 5c more.

WE have had one stalk of blue thistle in our garden this past year, and it seems to promise finely. It is always covered with bees from daylight until dark, for many months. Its unfortunate name is the only thing I know of against it.

IN our report of the vice-presidents for the coming year at the National Convention, we made one more mistake. We gave the name of Judge Andrews, of Texas, when it should have been W. K. Marshall, D. D., Marshall, Harrison Co., Texas.

WHERE you are owing us little balances that you do not wish to get a postal order or draft expressly for, but prefer to send it with next order, we have no objection to your so doing, providing you give the book-keepers notice by postal card, so they will find the matter taken care of when they make their monthly "voyages" through the ledgers. It will lighten their labors very materially, and I tell you it is no small task to look after a wayward family of about *ten thousand*.

SUCH heaps of matter have come in for GLEANINGS within the past few days, I have been positively unable to read it all, much less find a place for them in print. A good many of them, I notice, are plans for honey-houses. No doubt we shall get out a good one during the season, but I hardly know whom to give the hundred dollars to, for it will probably belong to a great many. The juveniles haven't tried to build honey-houses, but *I tell you they* have taken good care that their paper shall not stop for lack of matter.

WE commence the new year with 3632 names, which is almost a thousand more than we had at this time last year. During the month of December we have received 451 renewals, and 354 new names. My kindest thanks to you, dear friends; and all that worries me now is, that I may not be able to properly look after the wants of so many of you. A thousand is a pretty big addition to a family all at once, you see. Guess I'll have to give you all honey, as we do down in the lunch-room, and let you "slide" at that.

EARLY-AMBER sugar, it seems, has taken a new start. When in Kalamazoo, Prof. Cook said they now made it as white as granulated sugar. I asked him to send me a sample, but he said he might just as well dip it out of the bowl before us, for it was one and the same thing. This is truly good news. If any one can tell me where they are able to refine it to that degree, I shall be glad to get further facts in the matter.

AGAIN this year we are receiving cards like this: "Don't stop my journal; keep it going. I have subscribed through——" My friends, we would willingly trust you, or we would accommodate in almost any way; but when we send anybody goods they must be charged somewhere; and when the pay comes, somebody must be credited. If we charge it to you, and somebody else sends us the money, how shall we know whom to credit it? We can't see any way to fix it, so you can send the money to somebody else which you are owing us.

#### LABELING FILLED SECTIONS.

We have been considering the matter of grading sections, as you know, but there are some considerable difficulties in the way, to say nothing of extra handling, etc. A new feature has just come up: Put a nice label (something like Jones's, that won't soil) on all the dark or rough-looking ones. It is not a very great task, after they are all filled with honey; and as this label must go right to the consumer, it can easily tell him whose honey he wants to call for next time he wants some. Who will give us a design for a neat one?

EVERY little while some friend wants to know the price of a thousand circulars; and when told they will cost, say, \$6.00, he sends \$3.00 for 500. It can't begin to be "did," boys. Don't you see we should have all the type to set, any way? and to run 500 more through the press is but a trifling matter. If 1000 cost \$6.00, 500 ought to be at least \$5.00. Another friend sent 50 cents for a hundred labels with his name and address on. The clerk wrote back that we couldn't put name and address on for less than a dollar, of the kind he specified. His reply was, that if we couldn't print 100 for the 50 cents, print as many as we could for the money, and send them along. The point is, that the 50 cents wouldn't pay for setting up the type, etc.

#### THE SQUARE LIST.

ANY one conversant with the history of our laws knows how vainly we have tried to stop intemperance by legislation. Time and again some new plan or measure has been adopted and tried, only to find it didn't work well in all cases, and so it was dropped and some other measure tried. It is proving much the same with the plans we have been trying for years past to restrain unscrupulous (or unlucky, if you choose) brothers from buying supplies, bees, or honey, that they can't pay for. Whom shall we trust? is still the unsolved problem. In the Black List I tried to tell whom you should not trust, and in the Square List I tried to tell whom you might safely trust. Neither one worked as I expected it would. Procrastination has proved a more troublesome sin than dishonesty. Some got into the Black List only because they were too lazy to keep out, and eventually paid all up, and more too. Some got into the Square List who were so lazy, if nothing worse, that they had no sort of a right there. While it is my duty to publish promptly the name of every

man who is laying plans to get money without any intention of doing as he agrees, I can not see that it would be right to publish the names of those who buy unwisely, and then can not pay. We will do this, however: When you are in doubt, drop us a postal, and our book-keepers will tell you in a few words the habits of almost any man in the bee business.

## "Remindery,"

Or Department for duties to be attended to this month.

SEVERAL have written about the bees coming out of their hives when it was so cold they could not get back. For a colony containing many old bees, I believe this is nothing very unusual; nor need it be regarded as alarming while the numbers are few that thus perish, say half a dozen a day, or such a matter, for a bee, when he feels himself to be of no further use to the populace, usually takes himself off out of the way with the remaining strength he has, and I don't know but that this happens oftener in a good strong healthy colony than any other. Still, we must face the fact that colonies do sometimes winter, with scarcely a dead bee either outside or inside of the hive. Perhaps such have only young bees. Who can enlighten us? Another thing that may make the bees come out and die, may be too much ventilation, with too small a cluster of bees. I saw bees tumbling around on the snow in a kind of a dizzy way, before one of our hives in November, and upon examination I found them to be a very small cluster, in the ends of just a few combs containing solid sealed honey. They had got chilled through, and had the dysentery. A larger cluster, milder weather, or a smaller chamber to cluster in, would, I think, either one have checked the trouble. There is still a third cause for bees coming out when they ought not, and I do not know but that it is one we ought to consider more. You all know of the reports we have had stringing along for two years, indicating plainly that bees went through the severe winter of two years ago with the hive cracked from top to bottom, or with the honey-boxes all on, when whole apiaries, nicely packed, didn't. I fear we are putting too much chaff over our bees, or putting it in cloth sacks that are not open enough. Some covering is surely needed over the cluster; but I am inclined to think that a heavy colony will do better with something pretty loose, rather than too many warm pillows — friend Muth's straw mat, or two inches of chaff spread over coarsely woven bagging or burlap, for instance.

Lastly, bees will have the dysentery, and come out of their hives on the snow, when wintering on natural stores, when they would do nothing of the kind on stores made of granulated sugar. If they still have the dysentery when every thing else is all right, make the Good candy, as described last month, and put it right over the cluster, so they will eat it instead of the honey stored in their combs. In making it for such a case, I would use only the best clover or

basswood honey, to mix with the granulated sugar. In regard to disturbing bees in winter, I would open the hives only when the bees were coming out themselves. In the cellar, if your cellar is all right, you can open the hives by lamplight, and give them feed at any time, although many good authorities think it best not to disturb or stir them up at all in the winter. Never fuss with bees needlessly during the winter. It will pretty surely start them to rearing brood if you do, and this is seldom to be desired in winter. If the weather is so warm the bees are flying, the case is different; but even then I wouldn't take out the frames, unless you have some pretty good reason for so doing.

## KIND WORDS FROM OUR CUSTOMERS.

Please send me by mail a copy of A B C in cloth. I thought I knew mine by heart, and gave it away, but find I can't get along without it. My credit with you is more than enough to pay for it.

New York City, Nov. 24, 1882. F. D. CLARK.

The nucleus arrived all safe. I don't think there were a dozen dead bees in all. They appeared to be very gentle bees at first. They are pretty cross at present. We have got over 100 stocks, Italians, hybrids, and common bees, at present. They are the crossiest in the whole lot. Expressage to Marysville, \$2.80; 20 cents by stage out here: \$3.00, in all.

WILLIAM THOMPSON.

South Butte, Cal., Nov. 11, 1882.

I have sent to you several times, and I am always astonished to see how you can sell so good an article for so small a price. We have several hives of bees, and they increase very rapidly every year. I work with them mostly, as papa is always in his store. I like to work with them very much, so long as they don't get mad and sting. I have 2 hives myself, and I sold seven dollars' worth of honey from them last summer.

HORACE L. BARLOW.

Refugio, Texas, Nov. 7, 1882.

### KIND WORDS FROM NEW ZEALAND.

This is the beginning of the honey season here; my bees are hard at work on the willows and early fruit-blossoms just now. I find GLEANINGS a very interesting and useful paper, and I seem to never get tired of reading it, and I think that my wife has got the bee fever now through reading it, for she used scarcely to notice the bees before, but now she takes quite an interest in them. I saw some copies of labels in one number of GLEANINGS that quite took my fancy. I should like to try some of them, if they could be sent by post. We can not get any thing like them out here, not for three times the money.

JAMES ADAMSON.

Hastings, Hawkes Bay, N. Z., Sept. 7, 1882.

I have been borrowing GLEANINGS for the past year, and like it very much. No bee-keeper can afford to do without it. Please accept thanks for the A B C, which I obtained of you last summer. It is the best help to those engaged in bee culture I ever saw. We have 30 colonies of bees now, all packed in chaff, ready for winter. I have wintered successfully for two winters past. I think there is no trouble in wintering bees, if they have plenty of young bees and good honey, and are warmly packed in chaff on their summer stands, with a passage over the frames. I have been much pleased with the success you have had in the Tobacco Column. I think it is almost equal to the temperance cause. May God help you in the good work you have begun, and prosper you in your business.

O. G. RUSSELL.

Afton, N. Y., Nov. 13, 1882.

Now, friend Root, I am afraid you have made a mistake this time. May received her book all right, and the children are all so well pleased with it they are all wanting to write you a letter, even the little one that can scarcely talk plain. Now, what would you think to get five letters from one family, all un-

der eleven? I rather think you would wish you had not made that offer to the little folks. When GLEANINGS comes, the children must see it first, and they invariably turn to hunt for the cartoons and Home Papers.

MRS. J. A. COCHRAN.

Sherman, Texas, Dec., 1882.

[If I got five letters from one family, my good friend, I should think my juvenile project was working most beautifully. *By all means*, let them come, for it was the Master who said,—

“Suffer the little children to come unto me, and forbid them not; for of such is the kingdom of God.”—MARK 10: 14.]

As God is our universal Father, I feel constrained to call you “brother.” The A B C and Dzierzon Theory you sent me arrived in good order. I have traveled through the Dzierzon Theory with much pleasure and have commenced the A B C with the prospect of being a better man as far as bee culture is concerned, to say the least, by the time I get through with it. I have already perused several articles, which have amply paid for the book, whether I may see fit to keep a bee or not. It would seem by reading your most worthy book, as though you were one of the chosen to fulfill the bee mission, and I hope you may continue to be successful for all time to come, as in the past, and remain steadfast in well-doing, until you may accomplish the day when we may all be able to live on milk and honey, as of old. Go on, and help multiply and replenish the earth with those little winged friends, and you will be the better man for it.

WALTER S. PECK.

Syracuse, N. Y., Nov. 20, 1882.

### ONE'S OWN TOOLS.

Nothing in GLEANINGS has ever interested me more than your talk to boys and girls about the pleasures of farm life. There was a time in my life that I would not accept a farm as a gift, and be obliged to live on and work it; but now I prefer it to all other occupations. Your speaking of enjoying the work in the shop, and especially your *own tools*, reminds me very forcibly of when I commenced for myself. The very idea that the tools were mine gave me extra energy. The horses, cattle, and hogs, crops growing, and even the farm tools, looked so much better to me after possessing them, that it seemed to fairly open up a new world to me.

This is the first season since I commenced bee-keeping that the buckwheat has failed to secrete honey. Last season the drought injured it, but it was not a failure. My honey is all sold, and the bees paid big this year. I have 117 colonies packed in chaff hives. They are all strong, and have plenty of stores.

M. H. HUNT.

Bell Branch, Mich., Nov. 20, 1882.

[And I am delighted to find it is my old friend, whose name is appended to the bottom of so pleasant a letter. Yes, I do know what it is to work with one's own tools. How is the juvenile “farm” and “farmers” at your house? Haven't had any letters from them yet, have we, friend H.?

## Conventions.

### CONVENTION DIRECTORY.

#### TIME AND PLACE OF MEETING.

1883.

- Jan. 2, 3, 4.—The New York B. K. Union, at Albany, in the State Agricultural rooms.  
 Jan. 9.—Cortland Union Bee-Keepers' Association, at Cortland, N. Y.  
 Jan. 9, 10.—The Ohio State B. K. Association, at Columbus, O., in *Ohio State Journal* rooms.  
 Jan. 9, 10, 11.—The N. E. B. K. Association of New York, at Syracuse.  
 Jan. 11.—The Nebraska State B. K. Association, at Wahoo, Saunders Co.  
 Jan. 19, 20.—Mahoning Valley Bee-Keepers' Association at Berlin Center, Mahoning Co., O.  
 Jan. 20.—The S. E. B. K. Association of Michigan, at Ann Arbor, in Court-House.

**E. T. LEWIS & CO., TOLEDO, OHIO,**  
 Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianar Supplies. Send for circular. 11fd

# Headquarters in the South

FOR THE MANUFACTURE AND SALE OF

# Bee - Keepers' Supplies.

The only steam factory erected in the South, exclusively for the manufacture of Hives, Frames, Sections, etc., etc.

The Van Deusen-Nellis, and Root's Simplicity hives, and the  $4\frac{1}{4} \times 4\frac{1}{4}$  all-in-one-piece sections a specialty. Comb Foundation made on the Root's and Dunham's mill, of pure wax, and worked on shares.

Extractors, Smokers, Honey-Knives, Bee-Veils, and every thing needed in the apiary.

Italian Queens and Bees; no other races in my apiary or in the neighborhood. The superiority of the queens reared in my apiary is so well established, that no commendation is required. I send out no queen that I would not have for myself; and any one receiving a defective or worthless queen from me will have it replaced, etc.

Untested queens in April, \$1.25; in May, \$1.15; in June and after, \$1.00; rates per dozen given on application.

Tested queens, from March 1st to July 1st, \$2.50; and after, \$2.00.

Selected tested queens, reared previous season, to breed from, \$3.00. All my queens are reared from selected imported mothers of my own importation, and from selected daughters.

Early 4-frame nucleus, with tested queen, \$5.00. I have made a specialty of the 4-frame nucleus for the last four or five years, and have sent them out to all parts of the U. S. and Canada, and so far without loss or complaints.

Every nucleus I send out contains at least 3 lbs. of bees when received and sent out in the full-size Langstroth frame. They are cheaper and more advantageous than bees by the pound. Any one wishing a list of those to whom I sent nuclei the last season can have it on application, so that they can inquire what they were, etc.

Full colonies in any quantity. Perfect satisfaction guaranteed in every instance. For more particulars, and prices, send for my descriptive illustrated catalogue.

Will pay 25 cents in cash, or 27 cents in trade for beeswax.

**PAUL L. VIALLOIN,**  
**BOUYOU GOULA, IBERVILLE PARISH, LA.**

## QUEENS direct from the SOUTH.

Dollar Queens, in April and May, - - - \$1.25	Tested Queens in April and May, - - - \$2.50
"    "    "    June and after, - - - 1.00	"    "    "    June and after, - - - 2.00

Queens sent by mail. Safe arrival guaranteed.

W. J. ELLISON, Stateburgh, Sumter Co., S. C.

## HIVES -AND- SECTIONS.

We have just put in several new machines and also a larger engine in our factory, consequently we are in better shape to fill orders than ever for Bee-Hives, Sections, Shipping-Crates, etc. We make a specialty of our

### "BOSS" ONE-PIECE SECTIONS,

Patented June 28th, 1881. We can make the "Boss" One-Piece Sections any size or width desired. Send for Price List.

**JAS. FORNCROOK & CO.**

Watertown, Jeff. Co., Wis., Jan. 1, 1883.

**E. T. LEWIS & CO., TOLEDO, OHIO,**  
 Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apian Supplies. Send for circular. 1tf4

## WANTED!

Two assistants in the bee business. R. WILKIN, San Buenaventura, Ventura Co., Cal. 1d

## EARLY QUEENS!

We are preparing to send out, in March, untested Italian queens. Orders received now will be filled in the order received. We have 8 tested queens (wing cut), raised in nucleus late in the fall (and wintering in 4-frame nucleus), which will be sent when asked for (same price). We will advise all correspondents; and when they are ready, price can be forwarded to us. Price \$1 00.

**J. W. K. & A. G. SHAW,**  
 Loreauville, Iberia Parish, La.

## NORTHERN GROWN SEEDS, PLANTS, VINES, BULBS, ETC.,

at growers' prices, grown at my seed farm, fruit garden, and apiary. Descriptive catalogue free.

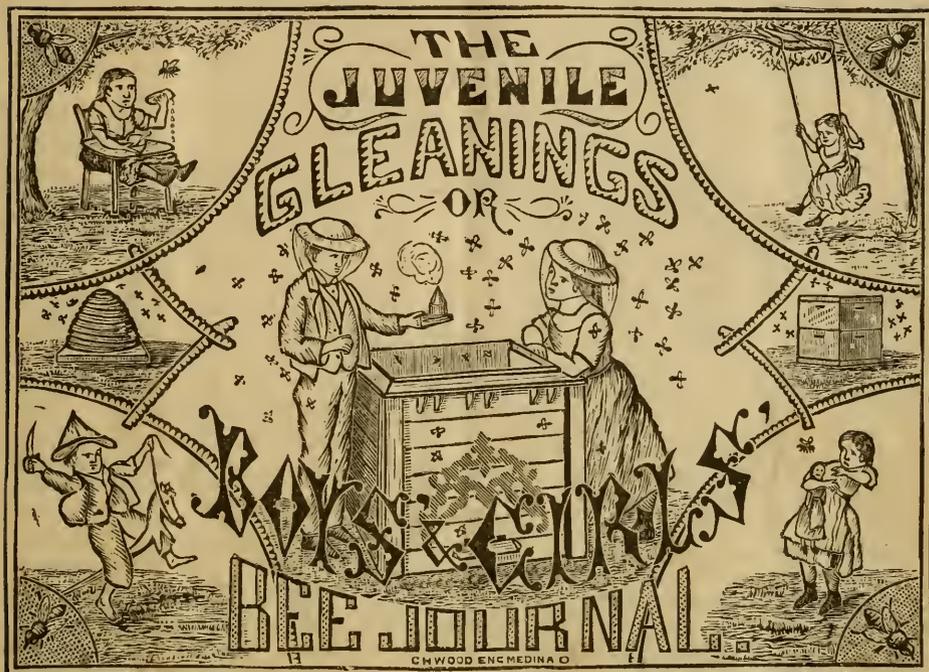

Address **JOHN H. MYERS,**  
 1-2d Saratoga Springs, N. Y.

## J. V. Caldwell, Cambridge, Henry Co., Illinois,

Manufacturer of Comb Foundation, and dealer in Supplies for the Apiary. New circular for 1883 now ready. Send for it. 1d

## Sweet-Clover Seed.

New and clean, 25 cts. per lb.  
 1-4 **BEN CLENDENON,** Grinnell, Iowa.

He that is faithful in that which is least, is faithful also in much.—LUKE 10: 16.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. 1.

JAN., 1883.

No. 10.

MYSELF AND MY NEIGHBORS.

Buy the truth, and sell it not; also wisdom, and instruction, and understanding.—PROV. 23:23.

**H**ERE I am at my type-writer again, my young friends; and, come to think of it, I am real glad I have got a type-writer too. Do you wish to know what it is like? Well, a little way off it might look like a sewing-machine; but when you get close to it you will see that, in place of any thing on top of it to sew with, it has keys something like a little melodeon. Each one of the keys has a little glass button on the end of it, and under this glass button is a letter or a figure. There are 44 characters in all; and when I strike the glass button it prints that letter on a roll of paper, or, rather, on a long sheet of paper, rolled on a rubber roller. Now, the difficult part of a type-writer is the mechanism that makes it print the letters all in a row, so as to make lines, and at the same time keep the letters all right side up. I wonder if I can explain it. Suppose you balance a lead-pencil across the edge of a wash-basin, letting one end rest inside just about on the center of the bottom. Well, now, if you were to strike on the end that sticks over the outside, this end in the bottom would fly up. Now, if a roll of paper were right over it in the right place, and a type were on the end of the pencil, it

might print a letter when it struck. Well, if you had 44 pencils, pivoted clear around the whole rim of the basin, striking their outer ends would print letters on the paper roll, and this is the way the type-writer works. Instead of striking letters I can strike periods and commas, and even spaces, so the words shall be separated.

At my right hand is a window that looks out toward the railroad, so I can see all the trains that come in, and all the goods that come and go away. At my left hand are the desks of the book-keepers I told you of last month. Behind my back is a sort of closet where the Waterbury watches are hung before the window. They make almost as much of a clatter as a lot of geese. I rather like them, though, for they sound so busy. I always enjoy going through a room where a great many are at work, making such a din and clatter that, if any one should stop to tell long stories, no one could hear him. The watches are all tested at the factory; but to be sure, we hang them all up and test them again here. After they have run correctly one day hanging up, we have one of the hands carry them a day. I have got two now that I am carrying. Addie comes to me every morning with a little willow basket full of "regulated" watches, as we call them, for they are the ones that have been up by the window until they have "behav-

ed" well one day. She takes two out of the basket and gives them to me, while I give her the two I have been carrying. If the two I hand over are exactly right, they go into boxes to be sent off to the first one of you that calls for one. If they are not right, they go back to the window again; and if they won't behave then, they are put into a box and go back to the factory where they are made, with a paper tied around their necks like naughty children, telling what their faults are. As the factory are steadily improving on them, the number to be sent back is daily growing less and less. Of the new series, just out, we are having remarkably good luck, if that is what it should be called. Almost every morning I find the watch in either pocket exactly right. I like watches. When I first went into business for myself I started a watch-repair shop; and when I went to bed at night, the last thing I heard as I closed my eyes was the busy ticking of the clocks and watches near my bed. I succeeded with them, because I loved them; and it wasn't very long before I had more work than I could myself attend to, and so along came a troop of boys and girls to help. In the drawer before the window behind my back are some of the tools I used to work with then, and I enjoy it now to sit down there and make trifling repairs, when I can find time. A watchmaker must be nice in his work, and careful and exact. One who can handle the delicate parts of clocks and watches, and do good to them, and never harm, usually commands good wages, and I am glad he does.

Didn't I tell you who Addie is? Perhaps I didn't. Well, when I used to be a "watch-fixer" her mother was a particular friend of mine, and by and by she got married, and there were some nice little girls at her house, and Addie is one of those little girls who have got "grewed up." Who told her about watches? Why, I guess I did. You see, she kind o' looks after them, just as you look after the chickens. She forgets them sometimes, but not very often; and then, you know she is one of my neighbors that I was going to tell you about; and as we always ought to be good friends with our neighbors, Addie is a pretty good friend of mine, even if I do have to talk to her sometimes very much as your mother talks to you.

Well, not only does Addie take care of the watches, but she also has it a part of her business to take your letters down to the counter store and get the scissors, pins, needles, clothes-lines, etc., that you order. Let us go with her on one of her shopping expeditions. She takes a basket, with a lot of letters in the bottom. "Lu," of whom I will tell you more after a while, has first gone over these letters, and picked out what were to go by mail, making the writing and the prices plain, before Addie takes them. Down there we find Eliza presiding. While Addie is picking the things she wants from the counters, Eliza puts more goods in their places. Her business is to see that every article is always in its place, or a card where it should be, having on it, "Sold Out;" then when I come along I can see at a glance just what goods we are needing.

More than this, Eliza keeps a book, with the names of goods nearly out. Here is what I find on the book now:—

"Five-cent flour-scoops, one left. Paper lamp-shades, two left. Mouse-traps, five-cent, two left," and so on.

Do you want to know who Eliza is? Well, I think we must have been "neighbors" for over 25 years. After Sue and I had more "prattlers" in our household than "mother" could well care for, Eliza came to live with us. The children now think about as much of her as of their own parents, and always did ever since I can remember. A few years ago Eliza got so tired of doing housework that, much as she loved the children, she had resolved to go off to the city and do some other kind of work. It happened just about the time I had got the "counter-store" fever, and finally I suggested that she should "keep store" for me, and not go away from the children entirely. I then learned, for the first time, that it had always been her wish to keep store, above any thing else. Eliza had been a Christian, years before I was. I presume she well remembers the time when everybody was astonished to see me suddenly become a praying man. Well, as I made all my projects a subject of prayer, I had been asking God's blessing on the store I wished to start, without dreaming that it had anything to do with her future. She was also praying for God's blessing as she went away from her old home. When "neighbors" are both going to the same God in prayer, do you not see how easy it is for him to show them how they may help each other? She has helped me, and I trust I have been able to help her.

Would you like to keep store? Well, if you wish to succeed, you want to be a Christian. If you have the desire in your heart to please God, this will make you fair and honest to your customers, as well as to your employer, if you have one.

Our counter store is now so filled up with goods that it becomes one of the fine arts to see how many goods can be put in a little space. Packages are piled clear up to the ceiling, and every shelf is made to hold just all it possibly can. The windows are filled, and goods are piled so closely to the stove they are in danger of being scorched. Goods that won't scorch are almost right against the stove; and when John was here during the holidays he made some wire-cloth baskets for lamp-chimneys, right close up to the stove-pipe. You see, lamp-chimneys are sold very often, and quite a stock must be kept on hand; and as they occupy a good deal of space it becomes quite necessary that they shall be always handy. We keep the bulk of them in the warehouse, in large casks. Well, now, when we make only about a cent apiece on them it will by no means pay to send a man to the warehouse every time half a dozen lamp-chimneys are wanted. Do you say a boy should do such jobs? But, my friends, we don't have boys in the factory at this time of the year. It is true, many of them would like to work, but it would keep them out of school, and I never want to hear anybody say I have kept boys out of school by giving them work here.

Besides the goods stored in the counter store, we have a large room full in the cellar, and a warehouse large enough to run a train of cars through, that is pretty well filled with goods, and bee-hives in the flat, ready to ship. If we don't look out, and keep things in order, we let goods get lost, and then go and order more when we have a lot already. I tell you, one has to look sharp, to sell things for five cents apiece, and hire folks to do it, and not have the expenses amount to more than the profit. Don't you see how glad I am to get real steady honest faithful hands that won't stop to talk and play, nor let things get scattered around and lost?

There is another little neighbor I think I shall have to tell you about, that I often meet in the counter store. It is Caddie, who isn't old enough to go to school. She is always happy whenever she can go down to the store, to see Eliza. She usually greets me with "Hello, pa," and then I have to look pleasant, and say, "Hello," back again. When a number are asking me things all at once, I can't always smoothe my face down to say hello, just on the minute; and then she gets hold of my hand, and says, "Why don't you answer, pa? it's me. I said hello to you." You see, I have to laugh then, and stop business long enough to return her greeting. Isn't it too bad, that I have to stop and laugh when I don't want to? Come to think of it, I believe it rather helps me with my work, in the end. What do you think? Do you ever help your papa that way?

While I think of it, I want to show you some pretty cups and saucers, of which we have just got a great cask full. They are printed, or decorated, and there are all sorts of different colors. They are 10 cts. for a cup and saucer, but we put a set, of 6 each, in a pretty little willow basket, and sell the whole for half a dollar. Blue Eyes and her cousin Millie sorted a lot of them out a few days before Christmas. It won't hardly pay to have them sent by mail, for the postage is 10 cents on a single cup and saucer; but when your father is getting goods of us, you might order some sent with them.

Do you want to know what Caddie does in the counter store? Well, she usually borrows a chair, and then gets one of the five-cent kitchen-sets and an orange, and has "supper." Then she gets a lot of dressed dolls, and sets them around in a tin pan, and has "school." Didn't I tell you we kept dolls for sale in the counter store? Well, we do. Eliza thought we wanted them, some time ago, but I argued they weren't "useful articles," and we don't sell any thing but that is useful; but Eliza didn't agree with me. Do you think dolls are useful articles? Caddie evidently does, for she "uses" them a great deal. I have sometimes worried a little for fear she would get them soiled before they were sold (and you know folks want dolls just like the new tin pans I was telling about last month); but

DECORATED CUP AND SAUCER.

Eliza says Caddie is always very careful of them. May be I have been a little selfish in getting things for the counter store for the boys only, without thinking that girls want dolls just as much as boys want sleds and wagons. Did you never know I was selfish? Well, I am. I will tell you of one place where I discovered I had been selfish.

Let's go back up stairs. I always go up three steps at a time. Can you keep up with me? You see, I have to write so much I get tired; and when I want exercise I run all over the rooms, to see if anybody is doing any thing wrong, or making any mistakes, and then run up stairs, just for fun. I don't make much racket, for I wear kid shoes so I can get around like a cat, you know; and then when I go outdoors I put on rubbers, so my feet are never muddy. We are wanting a carpet in our office, but we can't afford it just yet; and besides, we have a stove that makes so much litter it wouldn't work well. And, by the way, this stove is a "neighbor" that stands right before me, and pretty close too. Well, one day while I was writing I got too warm, and, as usual, opened the stove-door. As I did it, it occurred to me for the first time that perhaps the rest, whose desks were further away, might not be too warm. I thought a minute, and then spoke:—

"Girls! Have I been keeping the room too cold for you, in my selfishness, because I happen to sit close to the stove?"

I knew by the smiles that were passed around I had "struck the nail on the head;" and they finally confessed, laughingly, that they talked of asking me to write a "piece" on "cruelty to clerks," shortly after I wrote that one about cruelty to horses. It was because I was careless and thoughtless. When it was summer time I moved my type-writer quite near to the stove; and then, as it gave more room to pass into the closet where the watches are, I left it there when we began to have fires. After thinking a minute I told them I was sorry some of them did not talk right out plain to me and say,—

"Mr. Root, you are a big strong man, and warmly clothed, and sit close to the stove, while we are obliged to sit in different parts of the room, and yet you keep the stove at just such a temperature as to suit yourself, without a thought or care for our comfort."

I know you will plead for me, by saying I did not think, and that I did not mean to be unmindful of the comfort of others. I am inclined to think that a great part of the selfishness in this world is caused by people not thinking. My young friend, are you keeping anybody away from the stove this cold wintry weather? Are you standing in anybody's light? Are you making somebody suffer, by forgetting something you ought to remember? If so, you are not following the Master, for he "pleased not himself."

#### A GREAT NAME.

HOW SHALL WE BECOME GREAT?

**I**N our last number were some lines of poetry about Alexander the Great. In a few days after printing them we re-

ceived a letter from a reader in Pennsylvania, asking if we could not give the whole poem, for she used to know it, and had been looking for it a long time. Thinking many more would like to read it, we give it entire from McGuffey's Third Reader:—

- Son. How big was Alexander, pa,  
That people call him great?  
Was he, like old Goliath, tall?  
His spear a hundred weight?  
Was he so large that he could stand  
Like some tall steeple high;  
And while his feet were on the ground,  
His hands could touch the sky?
- Fath. Oh! no, my child: about as large  
As I or Uncle James.  
'Twas not his *stature* made him great,  
But greatness of his name.
- Son. His *name* so great? I know 'tis long,  
But easy quite to spell;  
And more than half a year ago  
I knew it very well.
- Fath. I mean, my child, his *actions* were  
So great, he got a name  
That everybody speaks with praise  
That tells about his fame.
- Son. Well, what great actions did he do?  
I want to know it all.
- Fath. Why, he it was that conquered Tyre,  
And leveled down her wall,  
And thousands of her people slew;  
And then to Persia went,  
And fire and sword on every side  
Through many a region sent.  
A hundred conquered cities shone  
With midnight burnings red;  
And strewed o'er many a battle-ground,  
A thousand soldiers' blood.
- Son. Did *killing* people make him great?  
Then why was Abdel Young,  
Who killed his neighbor training-day,  
Put into jail and hung?  
I never heard them call him great.
- Fath. Why, no, 'twas not in war;  
And him that kills a single man,  
His neighbors all abhor.
- Son. Well, then, if I should kill a man,  
I'd kill a hundred more;  
I should be great, and not get hung,  
Like Abdel Young, before.
- Fath. Not so, my child, 'twill never do:  
The gospel bids be kind.
- Son. Then they that *kill*, and they that *praise*,  
The gospel do not mind.
- Fath. You know, my child, the Bible says  
That you must always do  
To other people, as you wish  
To have them do to you.
- Son. But, pa, did Alexander wish  
That some strong man would come  
And burn his house, and kill him too,  
And do as he had done?  
And everybody calls him *great*,  
For killing people so!  
Well, now, what *right* he had to kill,  
I should be glad to know.  
If one should burn the buildings here,  
And kill the folks within,  
Would anybody call him great,  
For such a wicked thing?

For Juvenile Gleanings.

#### A DISH OF VIRGIL.

**A**H! what's this?  
Why, some of Virgil's poetry, to be sure.  
Virgil? who is he?

He was a poet, and you see people have a way of valuing poets, and deciding who was the greatest one that ever lived in the world, and who was the next greatest, and so on. The general decision is, that Homer was the greatest one, and Virgil the next greatest.

But, why should you be meddling in the matter,

Mr. Hasty? Let Mr. Virgil himself write, and send some poetry for us.

That would hardly work. Virgil lived 1900 years ago, and has been dead so long, that we couldn't expect him to write a letter to the JUVENILE GLEANINGS.

But, isn't his big poetry a little too tremendous for young people? And what business has it in a bee paper, any way?

You see, Virgil wrote a regular poetical A B C of bee culture, and that's the business he has in a bee paper; and as to his poetry being tremendous, I think, dear children, you all need to learn the difference between empty rhyme and jingle, and real, grand poetry. Real poetry has a certain gracefulness of air and exaltation of thought, both of which are frequently lacking in what passes for poetry. If you would just *study* this poem of Virgil's it would do you lots of good, may be. Scholars study months, and even years, to be able to read Virgil's poetry in the original Latin. Moreover, some of the big folks, it may be, will enjoy looking over our shoulders in this study.

Let us chat a little about the writer of this bee poem. We think it was a great while ago that Jesus was in the world doing miracles; and it was a few years longer ago that Virgil lived. He lived in a heathen country, in Rome, in a cruel, wicked age; and yet he seems to have been a gentle, modest, amiable, good man. And the people were so proud of their grand poet, that, when he came into an assembly, everybody rose up, just as they did when the emperor came in. The Romans were so much given to fighting and bloodshed that pretty much every thing useful was thought unworthy of a great man's attention; and so Virgil wrote for them four long poems about farming, fruit-growing, stock-raising, and bees, to turn their hearts to something better than killing people. Was it not kind of him to use his fame to do good? In Virgil's days many were wondering and talking about the Christ that was expected to come into the world, and so Virgil wrote a splendid poem about the reign of Christ on earth. In this poem there is a very touching prayer for himself, that he might live to see and write about the wonderful things that should be done. Virgil wanted very much to see the world's Christ. I have felt very sad for him many times that his prayer was not granted. He would not have been so very old if he had lived till Jesus was born at Bethlehem. Perhaps Jesus did just a little think of him when he said that many righteous men had desired to see and had not seen.

I think the common impression is, that Virgil didn't know much about bees, and that he drew on imagination and popular whims for his facts. I should like to do something to correct this idea. Virgil misapprehended his facts sometimes, as do all early investigators in any science; but for all that he is a scientist and not a romancer. I feel astonished to see how well informed and accurate he was. My feeling is, that no great poem in the world has suffered so much from the ignorance of those who have had the handling of it. It has been translated into English, but never, I think, by a modern bee-keeper, who would naturally take to its suggestions as a duck takes to water. So, if Mr. Root approves, I will render it for the JUVENILE.

You must understand, children, that the translation of a foreign poem into English rhyme can not be an exactly literal translation. Some liberties have

to be taken with the original words in order to complete the lines and rhyme them. Much, therefore, depends upon the translator; and one man's translation may sound considerably different from another's translation of the same thing.

Virgil had an excellent friend whose name is pronounced *Me-cen-as*, and to him he dedicated his treatise upon bees. And the figures in marks like this (4) refer to notes that I will put at the end of the poetry.

#### GEORGIC FOURTH.

##### INVOCATION.

The heavenly gift, the honey of the air, (1)  
 Mæcenas, I will now expound with care.  
 This portion also deign to ponder o'er,  
 As well as greater things I sang before.  
 The wonderful in little things I'll tell  
 Until your admiration it compel.  
 Of a whole race in order I'll relate,  
 Their leaders grand, the customs of their state,  
 Their teeming multitudes, their busy zeal,  
 Their glorious battles for the common weal.  
 Full well I know that one might call my care  
 A great ado about a small affair;  
 But small the glory surely will not be  
 If evil fates but yield the way for me,  
 And the great spirit of immortal song,  
 Called to my aid, shall hear and make me strong.

##### CHOOSING A LOCATION.

First a location and a proper spot  
 There must be sought for bees; and choose it not  
 Exposed to wind; (2) winds unrestrained and rude  
 Forbid the bees to carry home their food.  
 Choose not the place for apiarian bowers  
 Where sheep and butting goats insult the flowers;  
 Or wandering steers shake off the dew amain, (3)  
 And waste the growing herbs upon the plain.  
 From the fat hives these should be absent all,  
 Lizards, among repulsive things that crawl,  
 Painted as to their scaly backs with spots,  
 Let them be absent from the chosen plots;  
 The bee-eater, and other flying bands,  
 And swallows marked on breast with bloody hands;  
 All these plunder at large in fields of air,  
 And flying bees in cruel beak they bear  
 A dulcet morsel to their merc'less young,  
 No more to bask the fragrant flowers among.

But liquid founts, and ponds with mosses green,  
 Let these be present, and in silver sheen  
 The slender brook, swift hurrying thro' the grass,  
 Reviving nature as its waters pass. (6)  
 A palm should shade the entrance of the hive,  
 Or some great oleaster there should thrive. (7)  
 That when the kings (8) lead forth the first new  
 swarms,  
 In their own spring which all the earth transforms,  
 The royal youth just issued from the combs  
 May play, delighted, round their pleasant homes,  
 Where neighboring banks with summer glow invite  
 Betimes the festive monarchs to alight,  
 And a convenient tree across their way  
 With hospitable boughs may bid them stay.

There! isn't it excellent so far? Have the apiary so Eden-like with shade and waters and sunny banks that swarms can't afford to run away from it. Especially good is the counsel to have convenient trees right in the lines where swarms would naturally drift away.

(1) The condition of the air has more to do with the honey-crop than all other causes combined. Most of the famous honey regions of the world, California, Chili, the land of Canaan, Dalmatia, etc., are where the air, sweeping in the prevailing wind for a long distance over the water, is suddenly lifted up and rarified by a range of hills. No doubt, however, the idea prevailed then, as it does now, that honey sometimes fell in minute drops from the atmosphere. We certainly have floral honey and leaf honey and insect honey; and whether there is or is not a fourth kind that settles from the air, is in

doubt to this day. Some pretty strong evidence seems to indicate that there is such a thing.

(2) Very level-headed advice this is. Localities vary greatly; and it is worth while to search for a good one if you wish to keep many bees. To perch an apiary on the bald, windy top of a hill is very foolish. The poet also thinks of some more warnings about bad locations, and inserts them further along in the poem.

(3) California bee-keepers sometimes fairly cry out with vexation, their business is so interfered with by great flocks of sheep.

(4) Toads are bad enough, but lizards have the same greedy appetite for insects, and can stick their heads right in at the entrance. Aren't we glad they are not plentiful in this country?

(5) The kind of swallow mentioned here, the one with just a few red feathers on the breast, is, if I am right, never seen in this country. Considering the "cut of his jib," we don't want him, even if he is pretty.

(6) Great ponds and rivers are sometimes injurious; but little ones are beneficial.

(7) Virgil is here clear up to the high-water mark of modern practice. A palm is like a big umbrella on a pole. If the shade fell on the hive in the heat of the day it would not shade it night and morning. The oleaster, being similar to the olive, would throw a rather light, thin shade. The teaching seems to be, shade the hives, but not too much, and have sunshine morning and evening if you can.

(8) I suppose we might about as well admit here, that our poet seems not have found out that the object of affection and loyalty in a hive is a female. Surely, we can forgive him that much if we try hard.

Richards, O., Jan. 2, 1883.

E. E. HASTY.

I am very glad indeed that friend Hasty has taken up the cause of our good old friend Virgil, and I confess the point he makes is one I never really thought of before. I wonder if some of these children speak German as well as English, as our boy Jacob does. If so, they know how hard it is to interpret for any one something they do not quite understand themselves. Some years ago, before Jacob came here, we had letters from our friends in Germany, and some of the students in college wanted to translate them for us, just for the practice it afforded. Now, these students were educated, and smart, but they didn't know "bees" at all, as you and I do. Well, in one of their translations we found the word "bee-cradles." What do you suppose it was that they called a bee-cradle? They were a good deal troubled about it, and wrote, asking us if we knew any such thing. They said it seemed to be something the bees had to keep a young bee in, and they could not think of anything better than a cradle! How should they know, any way? I don't know whether they thought the bees rocked their babies to sleep, or not; but it was the nearest way they knew of to tell it. What was it they meant? Why, a *queen-cell*, of course. Well, now, those who translated Virgil had not only this trouble, but they had to get some word that would rhyme besides. Why, the reporters of our daily papers can't even write a report in English, so it sounds right to a bee-man. Just think of "horse-meat honey" and the like. Ernest is now study-

ing Virgil in college, and he and I had quite a laugh over "bee-cradles" only a few days ago. Give us the rest of it, friend Hasty, and put in plenty of your notes, to make it plain to "us children."

### MRS. HARRISON TO THE CHILDREN.

BEE-STINGS AND — PREMIUMS.

**C**HILDREN, I have just finished reading your letters in the last JUVENILE, and you are improving. Keep on taking pains, for that is the way to succeed.

If I were Mr. Root I should want all the boys and girls who write, to be bee-keepers — own at least one colony, and take care of it. Most of you could have a colony, could you not? and not get stung either, if you are careful.

There is one thing that you can do better than older persons in the apiary, and that is the watching. You see and hear quickly, and sing out, "The bees are swarming!" before any one else knows it. If you worked with bees more you would not be so afraid of them. That, at least, is the experience I have had with children. With but one exception, after they had been stung several times they cared very little about them. How many of you can catch a bee on the window, and put it out without being stung? How many of you will be bee-missionaries, and teach people to take better care of their bees? In order to do this, see how large a club of subscribers you can get for GLEANINGS for 1883, and get some of those nice premiums. A magnifying-glass would be a daisy, wouldn't it? If you had one, you could examine a bee's leg or wing, or see whether a drone has whiskers. A silver thimble would delight a girl; but how tall a boy would feel to gain the Waterbury!

MRS. L. HARRISON.

Peoria, Ill., Jan. 1, 1883.

### DO THEY CHOOSE A LOCATION BEFORE SWARMING?

BY ONE WHO ONCE WAS A BOY.

**Y**OUR article on bee-hunting recalls an incident of my boyhood days, when I lived in this State in the early settling of this section. An elder brother (a man grown, and a great bee-hunter) and myself were drawing a load of hay, and had to pass more than half a mile through the woods. He was driving the team, and I was lying on my back on the hay. As we passed under an oak-tree I could see a stream of bees pouring in and out of a knot-hole in the tree. I called to him, and we stopped and looked at them, and then went home with our hay; and after dark we came back prepared to cut the tree and carry home a fine lot of honey. But, lo! no comb, no honey, and but a single bee (evidently belated, he had concluded to stay over night) left of all the busy show of business but a few hours previous. If they had not cleaned out that tree for future occupancy, they were guilty of the grossest deception I ever knew to be practiced by the insect world.

D. BINNS.

Addison, Mich., Dec. 30, 1882.

Very good, friend B. Shall we not send you a book?

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye, takin' notes,  
An' faith, I'll prent it."

**D**ID you ever see a promissory note, children? A promissory note is given when one wants to pay the money for a thing, and doesn't have it, but has good reason to think he will have it after a while. For instance, suppose your father wants to do his plowing, and has only one horse. Well, he might wait until he got the money to buy the horse, were it not that the plowing must be done at the proper time, or it would be too late to sow the crop. Well, if he is a man of good reputation, almost any one would sell him the horse, and take his note for pay. The note would probably read something like this:—

\$150.00

Medina, O., Jan. 9, 1883.

*For value received, I promise to pay Thomas Jones, or bearer, one hundred and fifty dollars, ninety days after date.* A. I. Root.

You see, I am just supposing it was myself that was going to buy the horse, and, to tell the truth, I do need one; for although old Jack plows very well when he has another horse to help pull, he some way always seems disgusted when we try to plow with him on the one-horse plow.

Well, now I want you to notice the three first words of the above note. They are, "For value received." What do you suppose that means? What is the value received? Why, in the above case it is the horse, of course, and it ought to be a pretty good horse to be "value received" for \$150 too. Well, I was a little surprised to be told by my good friend Mr. Pond (he is a lawyer, you know), that a "promise to pay" would never stand law, unless it could be proven there was a "value received" along with it. True, we expect a Christian man to keep his promises; but the law recognizes that no man, in his right mind, would ever make a promise to pay, unless he had value received, in some shape or other. You see, they always go together, and one balances the other. I presume they balance about like the sandstone that the old gentle-

man used to go to mill with. He could not make the corn stay on the old horse's back, unless he put a big stone in the other end of the bag, to balance.

I wonder now if it won't be a good thing for us, my little friends, to try to have all our little business transactions balance. Do not let any thing be all on one side. Whenever you hold anybody's promise to pay, be sure they have value received. Now, see if we can't get down to business. I have promised you a book, if you would write me a letter; but I stated, too, that the letter was to tell something that everybody didn't know, or that would be worth something when I put it in print. Of course, I don't expect letters from children to be worth very much, and I don't "promise to pay" very much; but, my little friends, don't you think there ought to be just a little "value received"?

I very much dislike to find fault with these little letters, but I think it is chiefly for your own good that I should insist on something that will make you work just a little. As an illustration, here is a letter right before me that reads thus:—

I received the book you sent me, and was very much pleased with it. I should like to see my letter in print. Please send me Sheer Off.

JESSIE ALVERSON.

Gosport, Owen Co., Ind., Dec. 29, 1882.

Now do you see, little friends, that this is in reality only a report of the book she had, a request to see her letter in print, and a call for another book? It doesn't tell a single thing about bees, nor, in fact, about any thing else of value to the rest. Don't you think, my little friend Jessie, that it will be best to have you try again, and see if you can't send us something about bees, before we send you Sheer Off? Another thing: There are more letters than there is room for now, and so I shall have to pick out the most valuable ones to print. Don't you think that will be the best way? That is the way it is when we grow up; and this paying the best price for the best work is what makes us grow up to be strong, useful men and women. Now, you won't call this a scolding letter, for starting the new year, will you? It isn't because we are unwilling to furnish a *five-cent book*, but because we fear it would not be so well for *you* to send you books without requiring you to give some sort of "value received."

I go to school, and have a fine time. My father has 24 hives of bees. We took lots of honey this fall. Please send me a book.

MINNIE WILLIS.

Yocumtown, Pa., Nov. 13, 1882.

My brother-in-law keeps bees, and sometimes I go down there and they do not sting me. I should like to have one of your books that would suit a boy ten years old.

WILLIE E. DUMONT.

North Branch Depot, N. J., Nov. 6, 1882.

#### BEEES IN A HOUSE.

My brother has 11 swarms of bees. Last summer they made lots of honey. His bees are in a house which he built. My father is a wagon-maker.

GEORGE MILLER, age 12.

West Toledo, Ohio, Jan. 1, 1883.

I am a little boy seven years old. My mamma has two stands of bees. They have not swarmed this year. I should very much like a new book. I go to school.

LEON SPENCER.

Orange City, Fla., Nov. 10, 1882.

My pa has four stands of bees. I wash dishes for my ma, and do lots of chores for her.

ANNA TURNER.

Breeds, Fulton Co., Ill., Jan. 2, 1883.

That is the kind of girls I like, Anna; those who help their mothers.

I thought I would write you a letter. We have one hive of bees; we did have two, but another swarm came and robbed it. We received 65 lbs. of honey from the remaining hive, and we expect to have about four swarms in the spring.

LILY HOUSTON.

Wamego, Kansas, Dec. 27, 1882.

My pa has kept bees for over 16 years. I go to Sunday-school and day school. We are going to get our prizes next Sunday. I have got a book, and its name is Sheer Off, and as far as I have read in it I think it is a very nice book. I should like you to send me another.

ROBERT T. McNICHOL.

Weston, Ont., Can., Nov. 11, 1882.

My pa has 25 colonies, and 5 chaff hives. One hive has 3 swarms in it. I helped pa pack his bees in boxes for winter. Please give my card to Caddie.

KATIE M. JOY.

Elyria, O., Dec. 22, 1882.

I am always very glad to hear from my little friends, Katie, and Caddie sends you many thanks.

#### "GRANDPA'S JUVENILE."

I have been reading the children's letters in grandpa's JUVENILE. My grandp keeps bees. They made more honey last season than for many years before. They are black bees. I never saw any Italians. Grandpa says he is going to get a colony of them.

WM. E. ALVIS, age 10.

Montrose, Lee Co., Ia., Dec. 20, 1882.

My pa has 47 colonies of bees, and in spring we had only 25. We got only about 200 lbs. of honey this summer, as it was not a good honey year. We gave my brother one of the best ones this summer, and he did not get any honey. He wanted to feed them some sugar, but they would not eat it.

LIZZIE FRICK, age 13.

Mogadore, Ohio, Nov. 24, 1882.

Why, Lizzie, your bees must be funny if they won't eat sugar. I think I could make them "eat."

#### 100 LBS. COMB HONEY TO THE COLONY, ETC.

My pa is a bee-keeper. He has 31 stands, all Italians. One hive made 100 lbs. of comb honey, besides 50 lbs. to winter on. Some made only enough to winter on. I have two little sisters and one brother, named Emma, Ruth, and Walter. Old Santa Claus brought me a donkey and rider. I should like a book. Pa lost his price list. Please send him one. He wants to start a saw mill, and wants a saw.

EUGENE R. HIXON, age 7.

Sir John's Run, W. Va., Dec. 27, 1882.

Well, now there is an idea friend Eugene. When your father wants a new price list he doesn't have to write a letter, but only to tell his seven-year old clerk to do it. And you sent in his report too, didn't you?

## FROM 16 TO 25, AND 2000 LBS. OF HONEY.

My pa is a bee-keeper. He had 16 stands in the spring; sold 3 stands, and has 22 now, and they are all Italians. He has extracted 125½ lbs. of honey, and taken off about 750 lbs. in sections, and nearly all of it is sold.

G. W. MILLER.

Chariton, Iowa, Dec. 25, 1882.

Mamma has one swarm of bees, but they did not make any surplus honey this year. My aunt keeps bees. One year she had almost all of her honey stolen. Papa has about 40 cows, and I have two dogs; one is a shepherd, and the other is a little spaniel. I am 8 years old.

CHARLIE BAINES.

Norwich, N. Y., Dec. 30, 1882.

Is it really so, Charlie, that there is anybody so bad as to steal honey from a woman?

## THAT CHAFF HIVE, ETC.

Pa has just made a chaff hive. I tell you it looks nice. Pa takes great pride in his bees. I suppose that I have got to watch the bees all next summer. I watch them kill the drones, going down on their backs, killing them every minute. It is a great mystery to me how they know. To keep bees is a great thing to learn.

GEORGE B. STAPLES.

Taunton, Mass., Dec. 29, 1882.

## WHAT WALTER'S PA DID.

My pa keeps bees, and he took a queen-cell, and put it into a nucleus. He looked in it one day, and it had hatched, but he could not find her, and about 7 days after that he looked in the hive and found her; and as he did not want two queens in one hive, he took her and put her into another little box, and set it by a hive, and the bees killed her. Please send me Sheer Off, if I deserve it.

WALTER LIVINGSTON.

McVey, Macoupin Co., Ill., Dec., 1882.

I think you deserve it, Walter.

## ROBBED "TO DEATH."

My pa keeps bees. He has 30 hives of them. He gave me one hive. I thought it had not enough honey, and I fed it, and other bees found it out and robbed it to death. Pa works at building houses, and he makes all his hives. We get lots of honey; he sold it for 25 cts.

JOHN SPANGLER, age 13.

Shady Grove, Pa., Dec. 30, 1882.

When you attempt to feed *honey*, John, you must be awful careful, I — tell — you —, for it just sets those sneaking, pilfering bees crazy when they get a "sniff" of it.

## MATTIE'S FATHER'S NOVEL WAY OF HATCHING QUEEN-CELLS.

Father has been keeping bees for over 25 years, and has had good luck, except in 1880. We had 48 stands of bees, and they all froze but 3. The next year they increased to 7 stands, and in 1882 we had 19 stands, after 3 had run off. I want to know what you think of our way of hatching queens. Father takes the queen-cells when they are about 8 or 9 days old, and puts them in little tin boxes, and puts them under my old hen, and they hatch all right.

MATTIE COBLENTZ, age 13.

New Paris, O., Dec. 20, 1882.

Thanks, Mattie; but we have heard of the same thing before, only it was friend Atchley, of Dallas, Texas, who did it, and he used clam-shells instead of tin boxes. I shouldn't wonder if a sitting hen would answer very well in place of a lamp nursery.

DO YOU CARE IF A LITTLE SIX-YEAR-OLD GIRL WRITES A LETTER? I LIKE TO WATCH PAPA WORK WITH BEES, AND I LIKE HONEY. I SEE SOME OF MY LETTERS HANGING RILY THROUGH THE OIL.

JOSIE M. CONDON.

CLINTON, MO., DEC. 20, 1882.

I should think they had "nearly" tumbled over, Josie, when some of them are almost down flat. To be sure, I care to have 6-year-old girls write. I should like to know who has a better right to write, even if their letters are some of them "tumbled over." I told the printers to tip the letters just as you did, Josie; but I guess they have got them a little worse. Don't you think so?

## THE BOY THAT HASN'T ANY BEES.

I have no brothers nor sisters to play with me at home. I don't own any of the bees either, but I own a pet sheep named Chester. He can out-butt all creation. I had lots of fun when he was little, holding up my foot and letting him butt it. Pa says all the fun is on the sheep's side now, as one of his backings and charges is more dangerous than a charge of pa's crossbred hybrid bees. I forgot to say, that pa has Italians, hybrids, and black bees.

WIRT EDWARDS.

Sebree, Webster Co., Ky., Dec. 23, 1882.

## THE SUPERINTENDENT IN A BAD FIX.

Pa has 17 stands this winter. He makes his own hives. He sold \$10.00 worth last fall. We had lots of fun last summer when they swarmed. Pa pounded the bottom nearly out of mamma's dish-pan, trying to settle them; but they got away one Sunday. The bees stung papa when they swarmed, and his eye swelled so that he could not go to Sunday-school. He was superintendent. We all laughed at him. I have one brother and one sister. They are at school to-day. I am lame, and can't go to school when the roads are too bad to take a horse. Our schoolhouse is a mile and a half away.

DORA BUNKER, age 8.

El Dara, Pike Co., Ill., Dec. 29, 1882.

## TRIALS OF A MINISTERIAL BEE-KEEPER, REPORTED BY HIS LITTLE GIRL.

Papa takes GLEANINGS, and I like to read it. He takes a great deal of interest in bees. He took about 1000 lbs. of honey this year. My brother Willie often helps him. They both get a good many stings. Papa often gets stung on Saturday, so when he preaches on Sunday his eyes look very queer. Everybody in the congregation knows that he keeps bees, so they laugh at him a great deal, especially the young folks. I hope you will think this effort deserves a book; if you do, please send me Ten Nights in a Bar-Room.

CLARENCE B. ALEXANDER, age 12.

Dry Run, Pa., Dec. 19, 1882.

## MARK'S PAPA'S 200 STANDS OF BEES.

My papa has about 200 stands of bees. He gave me a stand, and they are doing very well. He gave my brother a stand. Papa got 2 more stands about a week ago. My brother got stung, and I have not seen him around the bees any since. My grandpa gave me and my brother nine rabbits, but two of them died. This is my first letter. I am going to school.

MARK BARBER.

Langford, Col., Nov. 26, 1882.

I guess your brother must have been

"busy" somewhere else, after he got stung; don't you think so, Mark?

A JUVENILE LETTER FROM MERRY ENGLAND.

My father keeps bees, and I help him to swarm them. He has 8 stocks now; 2 have died. We have GLEANINGS every month from Mr. Abbott. I like the JUVENILE very much, and I like honey; but we have not had any this year, as the bees did nothing but swarm. Father says he will give me a swarm next year. This is my first letter. I am just 9 years old. Can you send me a book?

GEORGE A. SISSLING.

Birkin Avenue, Nottingham, Eng., Dec. 21, 1882.

It would be funny if we couldn't, friend George, when you have written us a letter from so far.

LEFT-HANDED LAURA.

Pa had five stands of bees last spring, and has increased to 14. Ma and my sister Ellen hived lots of swarms. I go to school. I was left-handed, and my teacher is having me write with my right hand, and I can't do it as well as I could. Pa got 200 lbs. of extracted honey, and has sold \$60.00 worth of comb honey. I filled the upper story of the hives with straw and leaves.

LAURA WRIGHT, age 10.

Linn, Dallas Co., Ia., Dec. 23, 1882.

I think your teacher is a very reasonable one, Laura, and I am sure you will soon write as well right-handed as you ever did left. I am glad to know you like to help your father about the bees.

A LETTER FROM MY "COUNTRY NIECES."

Well, as you are getting letters from almost every one, I thought may be you would like one from one of your country nieces. My aunt Drusie has five swarms of bees. One day mamma and aunty were out working with the bees, when my little kitten went out and a bee stung it. You ought to have seen it run. It was pitiful, but I believe you would have laughed. Tell Blue Eyes that I have another kitten that is blue all over. Mr. Roof, you need not print this if you don't want to, but I hope you will.

EDNA GREAVES.

Moawequa, Ill., Dec. 23, 1882.

I would not laugh, if I were you, niece Edna, at any thing that gives any creature pain; but I presume you didn't mean to, did you?

HOW NELLIE'S FATHER GOT THE MOTH WORMS OUT.

My father had about 60 swarms of bees last spring; he now has about 75. He got about 1500 lbs. of honey. After he took off his honey, the millers bothered it so that he made a large box to put it in. It is about 16 feet long, and wide enough to hold two Langstroth frames, with a center-piece in the middle. Then there are holes cut in the side of the box and on the cover, which are covered with sercens; and when he wants to smoke the honey he has a slide to put over the holes, and then puts some fire and sulphur in a kettle, and puts it into the box, and that does its work effectually, and father thinks it is a grand thing to keep frames of old comb in.

NELLIE M. HUDSON.

Belden, Lorain Co., O., Dec. 23, 1882.

Nellie, our printers extend you a vote of thanks for the remarkably accurate manner in which your letter is written. Your writing is good, punctuation very fair, and spelling faultless.

FROM 4 TO 14, AND 600 LBS. OF HONEY, REPORTED BY A JUVENILE.

Pa had four swarms of bees in the spring, which increased by natural swarming to 14. Pa thinks he took off about 600 lbs. of honey, and they have plenty to do them this winter. He took six swarms of another man this fall, and is to pay for all he winters. He has them all ready for winter, but two or three; he makes a box a little larger than the hive, and puts it on, then he fills it with sawdust. We have Blue Eyes too, but it is a boy. He is the only brother I have. I have four sisters. If you think this letter is worth a book, please send me Pilgrim's Progress.

MATIE McCRORY.

Jerome, Ohio, Dec. 25, 1882.

To be sure, it is, with such a report, friend Matie.

AWAY OFF AMONG THE INDIANS.

My pa used to keep bees in Indiana; he had 11 stands, but last summer we moved to Arizona Territory with the Indians. I have seen but one bee since I have been here, and it was a bumble-bee. There are no bees here, for it is so hot and sandy. We get all our honey from California in cans. It is 12½ cents a pound. I like the comb honey best. Honey is good, but the bee-stings are not. Pa had a bee-smoker and a plane to make hives. We found a swarm in the church-yard. We put them in a hive, and took them home, but they soon left. Pa had one chaff hive; they were all Italians. We have no snow here, only on the mountains. I go to school, and sit with an Indian boy named Lewis Nelson.

JIMMIE ELLIS, age 11.

Tucson, Pima Co., Ariz., Dec. 1, 1882.

THE BOY THAT COULD FIND QUEENS BEFORE HE WAS 3 YEARS OLD.

My little boy, 2 years and 8 months old, could, last fall, find a queen bee when caged with 30 or 40 bees. He would say, "I want to show papa queen bee," and then would find her. In the summer he would come and stand by the hives while the frames were being taken out, and take as much interest in the whole transaction as myself. Although stung twice, he was just as keen as ever, and even now wants me to come and see the bees.

L. G. HALLUP.

New Hamburg, Ont., Can., Dec. 20, 1882.

And so, friend H., your boy might be of considerable service to some who have kept bees nearly all their lives, and can not yet find a queen. Who can say it will not pay to have a juvenile bee journal?

Happy Christmas to you! But then, I don't know you; but I think, from the size of your paper, you are not very big. Pa had two hives of bees on a hill about half a mile from our house, where there is a great deal of blue thistle. But some bad boys, I think they were, came along a few days or nights ago, and tried to steal some honey; but pa says they did not know how to go about it, and did not get much. What do you think ought to be done with such boys?

ANGIE BOSSERMAN.

Gettysburg, Pa., Dec. 25, 1882.

My way of doing with such boys, friend Angie, would be to get them to come to Sunday-school; and I think they would be more likely to come, if a girl about your age should ask them, than for almost anybody else. Did your pa leave the hives off on the hill away from any house?

## MORE ABOUT OUR FRIEND HANNAH.

I got the book some months ago, and thought it a tip-top one. It is a nicer one than the other. Hannah is not bothered yet with honey, but she has enough of syrup. My cats and rabbits are getting along well. For a while Hannah owned the rabbits. Mother had five birds, and four of them died.

ROSEY E. SMITH.

New Hamburg, Ont., Can., Nov. 10, 1882.

I thought I would write you a letter. I love to read the JUVENILE. Pa has 17 hives of bees, and he takes GLEANINGS. I don't believe pa could do without it. He has two Holy-Land queens, which are very nice. I love to watch the bees work, but I am afraid of them. They don't like me very much. Pa took off some honey in section boxes, which was nice. This is my first letter. Will you please send me Ten Nig ts in a Bar-Room?

ADDIE WISEHEART, age 14.

Graveland, Ind., Nov. 12, 1882.

Mamma has 11 hives of bees. She started with one in the spring. I am going to have a swarm next spring, if mamma's live. She has them all filled with chaff cushions. I am going to help her take care of the bees. I love to watch them work, and I like honey too. I have a colt, and I am going to break him to ride. I have a duck and turkey and rooster. Please send me a book.

LOUIS MARCH.

Tecumseh, Johnson Co., Neb., Nov. 2, 1882.

## A LETTER FROM THE SEA-SHORE.

It has been so dry that papa's bees didn't make much honey this year. They like sumac the best, but that doesn't yield much. Papa's farm is on the sea-shore, on a neck of land, and we have a nice bathing-beach. I should like to send Blue Eyes some cunning shells.

MABEL L. POTTER, age 9.

Faithaven, Mass., Dec. 1, 1882.

Many thanks, Mabel. We should like very much to see the shells when it gets warm enough so you can gather them.

## LETTER FROM A YOUNG 9-YEAR-OLD PRINTER.

My pa used to keep bees when he lived on the farm. Now he prints a paper called the Chautauqua News. When I am out of school I set type. When I get hungry for honey I come up to Uncle's and stay awhile.

NELLIE SHELDON.

Summerdale, Chaut. Co., N. Y., Jan. 3, 1883.

Only nine years old, and a girl too, and setting type! Nellie, please mark a place in your paper where you set, and send it to me.

My pa had 14 hives in the spring; they have increased to 38 by natural swarming. He has 23 in chaff hives, and the rest in American hives, but he wants to get them all into chaff hives. Pa dreamed that he ordered a lot of the Jones honey-pails, and they all came together on a string. I have two sisters and one brother. I go to school week days, but we have no Sunday-school. My pa takes the JUVENILE, and he likes it very much. My pa's name is J. T. Powell, and my ma's name is Hannah Powell. I should like Ten Nights in a Bar-Room.

CORA POWELL, age 12.

Sand Hill, Mo., Dec., 1882.

A funny dream, sure enough, Cora. But can't some of you folks start a Sunday-school in your place? I believe you could make a grand success of one.

## HOW TO SET A BEE-HIVE IN A TREE.

My pa has 19 stands of bees. They are placed under a shed, which is covered with a grapevine. Pa trianed it so it hangs over the front, and it makes a nice shade for them in the summer. We also gathered some nice grapes from the vines. We have one stand in a cedar-tree. A big limb in the center is sawn off, and a plank nailed on to set the hive on. The limbs come up on each side, which make a nice shade and shelter for them.

JESSIE ALVERSON, age 14.

Gosport, Owen Co., Ind., Sept. 26, 1882.

## BEES NEAR LARGE RIVERS.

As my pa has all he can do without working with bees, I have undertaken the job, and will try to see if I can make them pay. We live on the Ohio River, and our bees go over to get stores; and when it is chilly, and they are coming back loaded they fall into the river by thousands, and are drowned.

JOHN M. HOBBS.

Middleport, Meigs Co., O., Dec. 30, 1882.

You have made a good point, John; and that is, that bee-men should avoid locating too near large rivers.

Ma had two swarms of bees last spring, and my brother, who is ten, only one. One of ma's colonies swarmed. She has 4 now, and my brother had six new ones. He now has 16. Our bees did not make so much honey as we read of in GLEANINGS. A good many keep bees around here. Ma sent and got alsike clover to sow for the bees to work on.

Wickliffe, O., Dec. 29, 1882.

IDA FIELD.

If she had two and had only 1 swarm. I don't see how she has four now? How is it, friend Ida?

## DON'T LET THE BEES BE KILLED.

Papa has 28 colonies of bees. A man gave him one for robbing them. He was going to kill them, and take their honey. Papa told him it was wicked to do so. He told pa if he could do any thing with them he might have them. Pa fetched them home and gave them honey, and they are all right. I think that was better than to kill them; don't you?

JIMMIE JONES.

Cowden, Shelby Co., Ill., Dec. 25, 1882.

To be sure, I do, Jimmie; and I am glad to hear you papa is humane as well as enterprising.

Papa has kept bees 7 years. He has 75 stands—35 in chaff, and 40 in the cellar. I put together 1000 sections last summer. The bees made most of the honey from the basswood-trees. I went to school one term. I had the mumps, and had to stay out of school this winter.

BERTIE A. GILLETTE, age 8.

Le Roy, N. Y., Dec. 20, 1882.

There, I guess I know you, Bertie. Isn't your father the man who makes tin points? So he has half of his bees in the cellar, has he? I almost wish I had fixed ours so, and then may be six wouldn't have been dead.

## HOW ANNIE EARNED HER BEES.

My mamma keeps bees. We had two hives last spring, and they swarmed three times; they are all full of honey. We winter our bees in a bee-house, so as to keep them from the weather. I like to go to the bees, and see them come in loaded, they look so nice. One day all the rest of the family were awa from home, and the bees swarmed, and I made

them alight low; and when papa came home he hived them for me, and said I could have them, for I had watched them, and not let them run away. I like to work among bees.

ANNIE E. MITCHELL, age 12.

Glen Myer, Ont., Can., Dec. 29, 1882.

#### FROM 12 TO 26, AND 3500 LBS. OF HONEY.

My pa has 26 colonies of bees, and took out 2500 lbs. of extracted honey, and about 1000 one-pound section boxes this summer. We got an extractor and a honey-knife from you, and like them very well. I help my pa when he works with the bees. We have them all in chaff hives. We had 12 colonies this spring which increased to 26. HARRY BOOS.

Somonauk, Ill., Jan. 1, 1883.

Why, Harry, you have given us one of the "stunning" reports. Your father's 12 colonies have been worth more than some farms. How much did the honey sell for?

Papa has 18 stands of bees. I love honey, and I like to see them swarm. Papa beats the big bass drum; that brings them back when they start to go away. I have a little sister three years old. She likes the bees because they make good "yasscy." I like to read GLEANINGS. I go to school, and am eight years old. HARRY RUSSELL.

Lincoln, Ill., Nov. 24, 1882.

It is pretty well agreed among bee-keepers now, Harry, that beating on pans, drums, etc., does no good in making swarms stay or return. Much has been written on this subject, which will be profitable for you to read. What is "yassey," I'd like to know?

#### THE HIVE THAT DIDN'T SWARM FOR 11 YEARS.

We have 12 swarms. I help tend them. The way we got our first swarm, it went through our yard and we followed it to the woods. In the evening pa fixed up a small store-box and hived them in that. That was two years ago last spring, and we left them in their hive till last spring, when we had them transferred to one of your L. hives. We got another swarm then from my aunt (pa's sister). She had a hive that had not swarmed for 11 years. We got 3 swarms from that one the first year. Now, Mr. Root, if you think I deserve a book, Ten Nights in a Bar-Room will be my choice.

MINTHA HARSH, age 14.

Marshallville, O., Dec. 30, 1882.

#### SOMETHING MORE FROM THE ROLAND CHILDREN.

We have 80 stands of bees. My sisters, Helen and Anabel, have been to Ohio. I have 4 sisters and a brother — Anabel, Bertha, Helen, Adah Ethel, Roy. This is my first letter. We have three cows and one calf, and fifty chickens and three pigs. We have an engine and mill, corn-sheller, and sawing-machine.

JOHN ROLAND, age 9.

Grandview, Ia., Dec. 31, 1882.

We are very glad indeed to know you are getting on so well, friend John, for I have often thought of you since the sad letter came from your sister, which we printed last September. While your sisters were clear out here in Ohio, I should have been very glad to have seen them. With all the machinery you speak of, if you keep it all running at once, I can imagine you have almost as much care as I do at times. Good-by, John, and give my respects to Anabel and the rest.

I will tell you about our bees. They are all right now. We have lots of honey. We have 34 hives of bees. I go to Sunday-school. We are going to have an organ in our schoolhouse. LIZZIE JOHNSTON.

Danforth, Ill., Nov. 19, 1882.

"Bees are all right, and lots of honey." Well, that is right to the point, and covers the whole ground, for all I can see. Well done, Lizzie.

Pa has 30 colonies of bees; he thinks a great deal of them, especially his Italians. They have not been much profit to him this year, as there has been the greatest bee-famine since the middle of June that there has been for years. Pa takes GLEANINGS. I love to read it. We little folks think it quite a treat for you to send us the JUVENILE.

DORA B. THARP.

Eagle Mills, N. C., Nov. 26, 1882.

#### HONEY IN THE BIBLE.

I have been trying to find an answer to the Bible question which Cora M. Thayer gave us juveniles to find out. I can not answer the question she asked, but I think I have found out yours. Is it not I. Samuel 14:27 and Judges 14:9? May I ask one? "My son, eat thou honey, because it is good."

MAY E. HIGGINS.

South River, Md., Jan. 3, 1883.

Correct, friend May. Your question is asked in another letter, and you will find in this same letter an answer to the question that was "too much" for you. I hope all the little friends will read the history of Jonathan, the loving man, and Samson, the strong man.

#### ANOTHER LETTER FROM "HANNAH."

Father's bees and Uncle James Facey's have a slight touch of the dysentery. I see in Hugh Miller's "Testimony of the Rocks," that the first bee makes its appearance in the amber of the Eocene, locked up hermetically in its gem-like tomb, an embalmed corpse in a crystal coffin, along with fragments of flower-bearing herbs and trees. In answer to Cora M. Thayer, Proverbs 25:27. In answer to your question, Jonathan and Samson. Where in the Bible does it say ye shall not offer honey in sacrifice made by fire? Rosey says we are not all honey and syrup; we have quite a few vinegar-barrels.

HANNAH M. SMITH.

New Hamburg, Ont., Can., Jan. 1, 1883.

Right, Hannah; and now for a hunt for an answer to your question.

#### 100 LBS. A WEEK, AWAY DOWN IN MAINE.

My uncle Cecil has kept kept bees since a year ago last fall, and they swarmed twice. They made honey enough themselves, and there were two or three weeks when they made about 100 lbs. a week. He has put them in the cellar for the winter. He has no chaff hives, but is going to have some next winter. His bees get honey from buckwheat. "It is not good to eat much honey," is found in Proverbs 25:27. Where in the Bible does it say, "My son, eat thou honey, because it is good"?

GEO. F. GREELY, age 10.

Clinton, Kennebec Co., Maine, Dec. 30, 1882.

If your uncle has only four or five hives, friend George, 100 lbs. a week would do pretty well; but if he has 40 or 50 hives it would not be much to brag of. Do you see? You did not tell us how many he had, at all.

Pa had 16 stands of bees in the spring; he increased to 42, and got 300 lbs. of honey. He fed 600 lbs. of white sugar in the fall. He has them in the cellar. We belong to the Methodist Church. We go to Sunday-school in the summer. I have two sisters and two brothers. The youngest sister was one year old on Christmas. She has blue eyes. The Bible question that Cora asked, you will find in Proverbs 25:27. In answer to your question, wasn't it Samson and his father? This is my first letter, and if I deserve a book, please send me Ten Nights in a Bar-Room. JOHN WESLEY SWITZER, age 13. Fergus, Ont., Dec. 23, 1882.

That we will, "John Wesley." The first time I ever spoke in church was in a Methodist meeting. Don't you think I am almost a Methodist?—We are not so sure that Samson's father ate honey at all; see answers on preceding page.

I think the answer to Cora M. Thayer's question is Proverbs 25:27. Your question also, John, in Matt. 3:4; Jonathan, I. Samuel 14:29. I go to school this winter when I can. I have a very kind teacher. I should like to see Blue Eyes very much. Now, uncle, can't you make it pay to have a picture taken of your place, family, help, etc., just like every-day life, and put it on one of your counters, to be bought by our bee-keeping relatives? I should like one. How many of our cousins would like one too? I am glad that my brother has renewed his subscription for GLEANINGS, so I can read JUVENILE another year, for I like it very much. ALICE I. DEYO. Homowack, Sull. Co., N. Y., Dec. 25, 1882.

Why, you see, Alice, we have given pictures of our place with the A B C, and I am giving you "pen pictures" each month of what we are doing. However, I will think about the other picture, and may be we will have *something* of the kind. Thank you. It would take a pretty big picture to take in all the "help," Alice.—Your answers are very good, and show that *three* men in the Bible ate honey. The answers above give the names we had in mind. Who can mention another man in the Bible who ate honey?

We have 38 swarms of bees in chaff hives, stuffed with prairie hay, in good order for winter. Father is making hives for next summer. Last summer my bees swarmed. About half of them alighted on a little tree close to the hive, and the rest of the swarm flew around the house and settled on a tall tree. What made them do that? If this letter is worth a book, please send me Ten Nights in a Bar-Room. Brother Luke will write in this letter.

PRYER LINDLEY, age 9.

I have a little brother who is a year and a half old. He visited the apiary three times last summer alone and did not get stung. He would stoop down at the hive to see the bees. I have a hive of bees, and intend to be a bee-man some time. I love to read.

LUKE LINDLEY, age 7.

Lawn Hill, Iowa, Dec. 25, 1882.

I guess there is a "pair" of little ones at your house, aren't there, Luke?—a little bee-man and a little letter-writer.

#### LETTERS FROM THE TWINS.

We are very glad to call you uncle, as we have but one uncle in the world. We should like to live near you, if you can talk as well as you can write. We all

like GLEANINGS. Grandma keeps bees. She has 6 stands. She had a swarm of bees that she hived 3 times, but they would not stay hived. She said I might have them if I could keep them. I hived them four times, and then they went away, so I have no bees. MINNA J. DICKENS.

This is more evidence to prove the difficulty of keeping swarms when they resolve to go. How did you try to keep them at home? Did you use pans and drums, as one of our little friends speaks of doing?

I think that it must be nice to have so many nieces and nephews. Mina and I are twins. We are twelve years old. Grandma is going to send for an extractor and a smoker in the spring, if her bees winter well. We have no Sunday-school nor public school near enough for us to go to. ANNA DICKENS.

It seems too bad, Anna, that you can't go to school at all.

#### HARRIET'S LETTER, AND MY BIRD STORY.

My pa keeps bees. He has had them a long time. When he wanted any honey he used to kill the bees, and get the honey. They all died winter before last. He bought another hive of bees a year ago last spring. They are pure Italians, and he has 14 stands now. When my pa wants honey he uses an extractor. He gets lots of honey. He says he would never kill any more bees for their honey. We have 22 tame canaries, and what a noise they do make! This is my first letter. HARRIET WYATT, age 12. East Williams, Ont., Can., Dec. 20, 1882.

And that reminds me, friend Harriet, of a little story I heard about a canary. The lady didn't have 22, though, as you have, but she had only one. Well, she used to open the door of the cage, and let that one out, so he could fly around the house when they two were all alone together. What do you suppose he used to do when he got out? Why, he would get into the dirt in her flower-pots beside her house-plants, and scratch and wallow, just as hens do. Sometimes she would go into the other room, and then Birdie would get lonesome. If he couldn't hear her he would call out, "Tweet! tweet!" And then she would say, "Yes, Birdie," and then he would whistle and sing, to let her know he was satisfied. Well, one day he called, "Tweet! tweet!" and she called back, but he didn't seem satisfied. He kept saying, "Tweet! tweet!" right along, and wouldn't whistle at all. As she was very busy, she didn't go in right away, but pretty soon she thought his "Tweet! tweet!" sounded rather fainter, and she looked in to see where he was, and what do you think? Birdie was almost drowned in a big bowl of water. I suspect he thought it would do to take a bath in, and so hopped into it, just as he would into the dirt; but it was so much larger than his own bath, that he went down in all over; and then when he could not get out, the poor little fellow called to her the best way he could, and she only kept saying, "Yes, Birdie," and didn't come to take him out at all, until he was almost chilled to death, with the naughty water in that great awful bowl. But she did get him out, and dried him by the fire, and he got well, and sang as well as ever. Aren't you glad? I am. The lady told this to my wife.

I will give you papa's report for this year. In the spring he began with 19 stands of bees, and increased to 55. We did not get much honey this year, because the bees swarmed so. Papa has taken off about 400 lbs. of honey. Most of his bees are Italians, and in Simplicity hives. He got all of his hives from Mr. Flanagan.

#### SWARMS RUNNING AWAY.

One time when he was gone for hives, 3 swarms of bees came out, and before he got back they had gone to the woods. We had 6 or 7 swarms of bees go to the woods this year. We were taking off honey from a very cross hive of hybrids one time, and the bees came out and stung us all. Papa says he got stung 40 times. Mamma got stung on her hand and in her eye, and I got stung 3 times on my head; but I do not think becoming hurt much.

#### PLUMS.

We have the plums, "big as a peach," but we did not get \$7.00 a bushel for them, but we got 40 cts. a gallon, which would be \$3.20 a bushel. Would you like a tree? If you do, I will send you one. We call them the wild-goose plum. We sometimes picked up 50 gallons of plums in a day. Papa has also a farm, and he could hardly be in the field a minute, before the bees would swarm.

#### CATNIP.

We had a patch of catnip, and the bees were just roaring on it all summer. I saved a pound of seed. Do you want any? If so, what is it worth?

MAUD WHITESIDE, age 13.

Belleville, Ill., Dec. 14, 1882.

And a right good report it is, Maud.—It seems to me your pa lost almost as much as he gained the day he went after hives and let three swarms run off to the woods.—I should be real glad to get a tree of the kind you mention. We had a wild-goose plum-tree; but when the men were building our new house, somebody ran over it and broke it all down.—I think we have all the catnip seed we can use now, thank you.

#### WHAT HIVE TO ADVISE, ETC.

We live in town. Pa bought one swarm of bees last July; got 50 lbs. of honey from them. One swarm came out, but it ran away. He bought eight more swarms last fall. They are packed in planer chips. He wishes to transfer them to other hives in the spring, and would like to know what hive you think the best; also what will stop bees when they start to run away. Pa sowed some sweet-clover seed, and expects to sow some alsike, spider plant, and catnip, in the spring. I think you are very good to give the juveniles such good books, and so much space in your paper. Please send me The Roby Family, if you think I deserve it.

MAY FOOTE, age 14.

Creston, Iowa, Dec. 26, 1882.

What hive is best? is very often asked. If you mean without regard to cost, I should say the chaff hive. If you wish to extract honey only, the chaff hive fitted for the extractor. If you want the best hive for a little money, I should say the Simplicity hive; and if you expect to carry your hives into the cellar winters, I don't know but the Simplicity is as good as any, and they are a great deal easier to carry than chaff hives. All things considered, I would advise every apiarist to have about an equal number of

chaff and Simplicity hives, but to winter mostly in chaff hives.—When bees start to run away, throw dust or dirt among them, if you can. Sprinkle them with water, with a pail and dipper; use a fountain pump, if you have one; break up their ranks with sticks or clubs; chase after them, and see where they go; and some folks think making a noise to drown the note of the queen will make them come down, but it may be a mistake. To stop runaway swarms is, in short, sometimes the great problem.

#### A PUZZLE FOR THE JUVENILES.

MYPAHAS4HIVESOFBEESTHEYAREIN THE  
CELLARMYBROTHERSANDHELPEGETTHEM  
INWEDREWTHEMONASLEDFROMCHARLEY  
WHITING7

Venice, Cayuga Co., N. Y.

There, my chicks, who can read that? It is just exactly as I received it, and it is just as a good many of the wee ones write; but I suppose it is the best they can do, and I wouldn't have them stop writing, for any thing. While I think of it, some of the old ones, too, squeeze their words and letters up so closely it makes it quite a puzzle to get at just the truth, and then sometimes we don't, and troubles come. I'll tell you how I would do it. I would take twice as much paper as I intended to use. Then I would commence at the top, and make calculations to have a lot of blank space left below. Always have ruled paper (we have now some nice paper, nicely ruled, for only 15 cts. for a quarter of a ream—who will tell how many sheets there are in a quarter of a ream?) and when you get pretty near the end of the line, don't try to squeeze another word in, but just commence on the next line. Put in all the commas; and when you are not sure, put in a few too many. You will learn how after a while. When you get to the end of a sentence, always put a period, and then take a little more room, and commence with a capital letter. Omitting these capital letters, when they commence a new sentence, is one of the worst habits, I tell you. We have had some of the worst kind of blunders in business, because the writer didn't use a capital letter when he began to talk about something else. Now, you children have plenty of time, and usually plenty of paper, I think, and I want you to learn to write real nice clean plain letters. Now, my little Charley, I want you to write me a nice little letter, with spaces between the words, won't you? and then, you see, I shall know you haven't felt hurt at what I have said. We're good friends yet, are we not, Charley?

#### WHAT MADE THEM STING SO?

My brother Charlie has six swarms of bees now. The old swarm in the log I wrote about last June died this fall. He extracted about 200 lbs. of honey, and the bees have plenty to winter on. He packed them in hemlock boughs, and they look as nice as if they were on a Christmas-tree. They swarmed four times last summer, three times when Charlie was gone, and ma had to hive them. Once she had been using coal oil, and looked out the window, and saw the bees coming out, so she slipped on some kid gloves and started for them. As soon as she began

to brush them into the hive they began to cluster on her hands as if the queen might have been there, but every one stung her hands.

ABNER STRONG, age 9.

Millington, Mich., Dec. 22, 1882.

I think, Abner, that it was the kid gloves that made them sting so viciously, but the coal oil on her hands may have had something to do with it. I am very sorry she got stung so badly.

I came home to spend Thanksgiving. I have been away to school, and I found Albert and Gertie had been writing for a book, and I thought I would. I wrote once before and got a book. I will tell you how strangely our bees acted last summer. Pa put a swarm of bees into a new hive, with the fdn. all in, and they stayed about two days, and then left and went to the woods. Pa went away from home one day, and there was a swarm which came out, and mamma put them into the same hive, and they went away, and then pa said he would examine that hive and see what the trouble was, and he couldn't find any thing wrong, except that the fdn. was cut so the honey-cells were crooked, and he thought they were disgusted, and so they left. Do you think that would make any difference? Pa has been very particular since then to get it straight. My sister has a little bantam hen, and it is very tame.

EDITH M. HALL, age 12.

Northfield, Minn., Dec. 2, 1882.

#### LETTER FROM FREDDY CRAYCRAFT.

We have two colonies of bees. They are fed and packed up for winter. We had a very nice Christmas. There was a Christmas-tree at the church, and papa made me a present of a nice watch. Our greenhouse is full of flowers, and they are in bloom. I wish you a happy Christmas and a merry New Year. Please find inclosed the specimen of a patent Kentucky bee-hive.

FREDDIE CRAYCRAFT.

Salem, Ind., Jan. 1, 1883.

With the above letter Freddie sends a circular which is headed as follows:—

#### THE UNMEDDLED,

SELF-PROTECTOR, MOTH-ROLLER BEE-HIVE!  
INVENTED BY JOHN PHILLIPS.

I suppose the "unmeddled," means the hive is not to be opened and the frames taken out; and there is very good reason indeed for it, for it is a box hive, and therefore has no frames to take out. The "moth roller" is some kind of a "patent" to roll the moths out of the hive themselves. Would not that be funny, children, to see the moths keeling over backward out of the hive, when they couldn't help themselves? Patent moth-trap hives are rather behind the times now, and we guess friend Phillips must live back in the woods somewhere where they don't have bee journals.

#### GERTIE'S LETTER.

My pa has 63 colonies of bees, all in Langstroth frames. I have a colony. It has 15 frames, and has made the most honey for the last 2 years of any in the lot. I don't know but I cheated myself. I gave pa all the increase and honey, except one section every time a crate is taken off. I help take care of them, and put the sections together. This has been a poor year for honey here. The old swarm has made only about 40 lbs.

#### QUEENS FLYING FROM A COMB WHEN THE HIVE IS OPEN.

Pa and I went out to clip the wing of a Holy-Land queen which we got of Mr. Alley last summer. When we took the frame out she flew and did not come back. Do you think she has gone back to the Holy Land?

#### LONG TENEMENT HIVES.

Pa thought he would see how bees would do in long hives close together, and so he made two chaff hives. He put 4 swarms in one hive on 12 racks each, and on the other he put 8 swarms having 6 racks each, divided by division-boards down between the frames. Half fly out one side, and half the other side, and each hive is painted a different color. They look nice. This is my first letter. If you think I deserve a book, please send me Ten Nights in a Bar-Room.

GERTIE A. WILLIAMS, age 13.

Lottsville, Warren Co., Pa., Jan. 1, 1883.

I don't think it was a very bad "cheat," Gertie, if your father was the gainer?—No, I don't think the queen flew across the ocean to Palestine, but I do think she went back and entered some hive pretty close to her own, within 15 minutes or half an hour. I don't think I ever had a queen fly in that way without finding her pretty soon, either dead or alive, in front of some neighboring hive, if she didn't come back to her own home. I would always leave the hive open, and the frame as near where it was when she went off as I could, until she was found.—Long tenement hives are an old idea, but I believe almost every one gives them up, sooner or later.—Your letter is well worth a book, friend Gertie.

## Reports Encouraging.

FRIEND LAY, AND HIS ANTICIPATION FOR THE NEW YEAR.

OUR Cincinnati visit was an exceedingly pleasant one to myself, and it seemed that all enjoyed themselves very much. I indeed consider it a rare treat to listen to the very pleasant and highly interesting talks from such eminent men as were assembled on that occasion. I shall never forget the genial spirits whom I met there. *Let's have another.* The winter so far has been mild and pleasant; the mercury reached 28° above zero Dec. 16. Bees are in fine condition; they have not been confined longer than 2 days at a time. They will begin to get pollen in about 15 or 20 days.

Will you be kind enough to say to the boys up in your part of this great national apiary, not to let *horsemint* and *Cyprians* trouble their dreams, but to wait and listen? for ere the 4th of July guns boom upon midsummer air we are going to send up some bee and honey reports that will startle the natives from Maine to Wisconsin, and then, leaping the Rocky Mountains, will cause a mighty rattling among the white-sage bushes of old California. Under the genial warmth of our bright skies, and nursed by sea-born zephyrs, our honey-plants are already springing into life. Give a Texas hoosier plenty of horsemint honey and milk, and you can not keep his tongue still.

J. H. LAY, M. D.

Hallettsville, Texas, Dec. 27, 1882.

**THE ONE-HIVE APIARY THAT WOULDN'T STAY SO.**

I started with one stand, and now I've so many I must either become a bee-keeper or get rid of some of the bees. Which? MRS. M. A. SHEPHERD.  
Barry, Pike Co., Ill., Dec. 29, 1882.

**FROM 2 TO 10, AND 800 LBS. HONEY.**

Bees did well here this year. I started with two stands; increased to 10; could have had 20, and 800 lbs. honey, mostly extracted. WM. HILLS.  
Ironton, Mo., Dec. 26, 1882.

I have 20 colonies, mostly hybrids, of all grades. Started with 6 stands in spring, and made 250 lbs. of extracted honey; all sold in town at 20 cts. per lb., and call for more. JACOB FISCHER.  
Elizabethtown, Ky., Dec. 30, 1882.

My report for 1882 is as follows: 2500 lbs. comb honey, sold at 20 and 25c in New York. Very little increase in stocks; 84 colonies packed in chaff on summer stands, constitute the number of colonies that I have at present. ALBERT BRUSH.  
Susquehanna, Pa., Dec. 27, 1882.

**152½ LBS. TO THE HIVE, AND THREEFOLD INCREASE.**

I don't think my bees would work for me if I did not do according to instructions in A B C and GLEANINGS. My bees have done very well this summer. Average yield per colony, spring count, was 152½ lbs. and increased threefold. E. S. COLLINS.  
Cedar Lake, Mich., Dec. 28, 1882.

My 8 stands of bees did well this year. They average 100 lbs. per stand. How is that for a beginner? I cut off a limb of a tree with a swarm in it, and took 15 lbs. of honey from them. I tried to save them, but the little pcts got drowned, and so I lost them. LOUIS WERNER.  
Edwardsville, Ill., Dec. 28, 1882.

My bees are mostly blacks; a few colonies are hybrids, and two Italians. I had 30 colonies last spring, mostly in good condition. Increased to 45 and sold 5000 lbs. of honey in section boxes, at 20 cts. per lb., besides using all that a family of seven wants to eat, and gave the neighbors perhaps 75 or 80 lbs., so you see I still think the blacks worth caring for. W. T. ROPP.  
Delaware, O., Jan. 2, 1882.

**PENNSYLVANIA NOT TO BE COUNTED OUT.**

Some one says, "Cross Pennsylvania out;" they had better not be so fast; although there are better places, we shall not quit bee-keeping. It has been a very bad year, but we have some honey. I started in the spring with 30 colonies; increased to 56, and took 1000 lbs. of comb honey, and 1000 of extracted. A. W. LINDSEY.  
West Brooklyn, Pa., Dec. 25, 1882.

The like was never known before, of such a yield of honey as we have had during the past season, in this part of the State. In fact, it was a honey harvest all summer. It was hard work for us to give our 160 colonies all the room they needed for storing. Many of our colonies gave over 200 lbs. to the hive, while a few did nothing; and such, I will take care that their queens' heads come off in the spring. Honey crop, 16,000 lbs. JAS. SPENCER.  
Woodburn, Iowa, Jan. 10, 1882.

**THE FIRST REPORT OF HONEY IN 1883.**

The bees are working to-day on alfalaree, pepper, eucalyptus, lemon, lime, and orange blossoms; within the past 3 weeks they have filled their hives

so completely that I shall have to extract in order to give the queens room to breed. E. GALLUP.  
Santa Ana, Cal., Dec. 23, 1882.

Well, friend Gallup, that is a big contrast from our report this 8th day of January. Our bees are out in the zero weather, and six out of our 185 are dead already. No reason could be assigned, except that they had eaten the honey all around them, and the cluster was too small for them to move over to it. There, I declare I forgot this was the department for Reports *En-couraging*.

**KIND WORDS FROM OUR CUSTOMERS.**

Those circular saws are just splendid; they are not for sale. G. S. DENNISON.  
Tiffin, Iowa, Jan. 1, 1883.

Don't you see that I can not do without GLEANINGS? You can not get rid of me for one dollar a year. LEONIDAS CARSON.  
Frederick, Ohio, Dec. 19, 1882.

Inclosed please find 91 cts., for which please send me another telephone. This is about six I have ordered. JAMES E. TILMAN.  
Akron, Fulton Co., Ind., Dec. 22, 1882.

Will you please send the Dec. number of JUVENILE? I suppose one was sent, but was lost on the way, and it is causing considerable lamentation among the juveniles here. T. A. WHITESIDE.  
Belleville, Ill., Jan. 1, 1883.

**"DO THEY MISS ME?"**

Goods arrived in splendid condition. Many thanks. But oh! the JUVENILE GLEANINGS has not come this month, and the children are almost crying about it. A. COX.  
White Lick, Ind., Dec. 27, 1882.

I had 5 stands last spring. I went to work and fed them up; they went to work, and made me nearly 100 lbs. to the hive. I give all the credit to the fdn. I got of you. I have 13 stands wintering nicely so far. C. M. BENNETT.  
South Charleston, Clark Co., O., Jan. 1, 1883.

**THE 75-CENT TELEPHONES.**

The telephones have been giving splendid satisfaction — so much so that most of our neighbors have concluded to have one. Inclosed please find 91 cts. for another one. Had I known so many were wanted, I might have inclosed all in one order. JAMES E. TILMAN.  
Akron, Ind., Jan. 1, 1883.

My brother, do not consider your efforts vain, or that they will be lost, while you are striving to elevate the moral standard of the young; for upon these the great future hope of our country depends. Press home in the future, as in the past, the great importance of sobriety in habits and morals, and that strict honesty is essential to permanent success in life. As the circulation of your publication increases, your ability to do good, and your responsibility also, increases. May the good Lord direct you aright! J. Y. KEZARTEE.  
Ceresco, Mich., Dec. 28, 1882.

[And may God bless you for your kind and cheery words, brother K.]

**FROM A CALIFORNIA MOTHER.**

Your card of acknowledgment came three days after I sent my last postal. Where I lived when a girl, the boys used to come around early Christmas morning, singing,

"Wish you a merry Christmas and a happy New Year,  
A pocket full of money and a cellar full of beer."

I wish you the same, only change the last letter of the last word into s. Ernie says, "Thank Mr. Root for the nice books you sent him." I also thank you, for it is a help to him about learning. He reads well in his school-books, but hesitates about trying other books till he had one of his own sent by Mr. Root for the little letter he wrote. Now I can get him to try almost any thing in the shape of juvenile reading. MRS. JOEL HILTON.

Los Alamos, Cal., Dec. 29, 1882.

And thine ears shall hear a word behind thee, saying, This is the way, walk ye in it, when ye turn to the right hand, and when ye turn to the left.—ISA. 30:21.

TRADE is better than ever before, so early in the season, but we are not so much crowded but that every thing goes off promptly, with but few exceptions.

THE excellent sledding we have been having for the past few weeks has given us a chance to buy a large lot of extra nice basswood for sections. We have a fine stock already piled in the warehouse, against the time of need soon coming.

### PRICE OF WAX AND FOUNDATION.

WE are obliged to give notice, that after Feb. 1st the price of foundation will be advanced 3 cents per lb. This will make 25 lbs. or less, an even 50 cents per lb. The same thin, for sections, 60c. As usual, 1 cent less for regular-sized sheets, and another cent less for regular-sized boxes that we have all boxed ready to ship. For good wax, we pay 28 cents cash, or 30 cents in trade.

### THE GOOD CANDY FOR WINTER FEEDING.

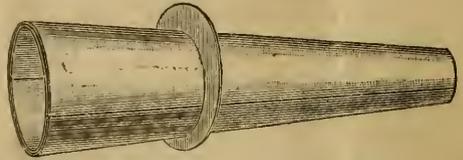

IN making the Good candy, be careful that it is not too soft. Our apiarist had a lot that was just right, but was so hard he could not spoon it out fast enough to suit him, and so he stirred in more honey. The consequence was, that when it got warmed up it ran down between the combs. Let it be hard, and cut it out in chunks with a knife, if necessary. It looks to me now as if it bid fair to supersede all feeders and other methods of feeding.

### FOUNDATION MILLS FOR 1883.

FOR the first time, foundation mills are now made in our own building. I have purchased the entire business, both of friend Olm, of Fond du Lac, Wis., and friend Washburn, of our own place, with all the tools belonging to both. We are prepared to put hands enough to work at the business to turn out a complete mill every day, if need be. Our rolls are now made of a very much harder metal than those made heretofore, and on this account they may not look as smooth as our old ones; but the fdn. is exactly what is wanted by the bees, and the wax comes off far better, as you will discover. Our aim is to make fdn. most acceptable to the bees; not that with hard polished wax, even if the latter is a little handsomer to look at. We haven't the mills piled up ready to ship, as we have scales and other goods, but hope to have them so by the time we come again.

### MAPLE SUGAR, AND TOOLS FOR MAKING IT.

NOT a few of our bee friends are probably sugar-makers, and it begins to be time for us to be thinking about our utensils. We have spiles like those shown below, for \$1.50 per 100, or \$12.50 per 1000.

SAP-SPILE.

They are made of double tin, and finished by dipping them in melted tin, which makes them absolutely rust-proof. Bits, 3/4 inch, for tapping trees, right for the above spiles, 20 cts. each; by mail, 23 cts. Braces to hold the bits, 25 and 50 cents. Postage on the braces, 18 and 27 cts. respectively. Patty pans, for little cakes, from 10 to 30 cts per dozen.

SAP-PAILS; PRICE PER 100.

	Common Tin.	Charcoal, 1C Tin.	Charcoal, 1X Tin.
10-quart.	\$16.50	\$18.00	\$20 00
12-quart.	\$18.00	\$20.00	\$23 00

Tin covers for above, \$4.50 per 100.

The pails made of common tin will do very well if they are cared for; but they must be warmed, and rubbed with a little tallow on a cloth, and kept out of the weather when not in use, or they will rust sooner than the other. Those made of charcoal tin will stand the rust as well as any tin, but all are much improved by being greased every season when put away. The 1X tin is better than the 1C only in being heavier, and standing a bruise better; but the 1C is considerably the lighter to handle. I have been told, that giving them a thin coat of sugar by dipping them in weak syrup before they are put away is a perfect protection against rust. I presume it would make them a little sticky to handle. The covers are to keep out rain, leaves, bugs, millers, mice, etc.; and, most of all, to keep rain water from running down the body of the trees, and coloring the sap, and so the syrup and sugar. Maple syrup can be made as white as clover honey, and sugar in the same proportion, and then you can get all most any price you ask, for the first run.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

**\$1.00 Queens.**

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Be in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \* use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apian supplies. Send for circular. 1tfd

**Sweet - Clover Seed.**  
New and clean, 25 cts. per lb.  
1-4 BEN CLENENDON, Grinnell, Iowa.

**50 TO 150 COLONIES OF PURE ITALIAN BEES,**  
In new, superior, well-painted, movable-frame hives (frames 12 1/4 x 12 1/4 in.), for sale at \$8.00 per colony, delivered at depot or express office at Lexington, LaFayette Co., Mo. DR. G. W. YOUNG.  
12-2d

## Honey Column.

### CITY MARKETS.

CHICAGO.—*Honey*.—Prices are unchanged, but the supply is more than equal to the demand. *Beeswax* is scarce, and rules at 27c for bright yellow, cash on arrival; dark and off color, 17@22c.

ALFRED H. NEWMAN.

923 West Madison St., Chicago, Ill., Jan. 23, 1883.

CLEVELAND.—*Honey*.—*Honey* is quite dull just now; but every other kind of goods is the same; prices, however, have not changed much. Best white 1-lb. sections are selling at 20 cts.; 2 lbs. 19; second quality, 17 to 19. Extracted does not sell at all; have never known it so dull before; nominally held at 9 to 11 for bbls. and kegs, and 12 to 13 in cans. *Beeswax* very scarce at 30. A. C. KENDEL.

Cleveland, O., Jan. 22, 1883.

DETROIT.—*Honey*.—The demand for honey is but very light, and the market is fully supplied. Sales are made with difficulty at 16@18 cts. *Beeswax* is worth about 30 cts. A. B. WEED.

Detroit, Mich., Jan. 23, 1883.

CINCINNATI.—*Honey*.—There is no excitement in the honey market, but sales are fair to our regular trade. Offerings of comb and extracted honey are plentiful. Extracted brings 7@9 cts. on arrival. The sales of comb honey are very slow, although there is a large supply of first-class quality on the market. It brings 12@13 cts. on arrival. *Beeswax* comes in slowly, and is in good demand at 20@30 cts., according to quality. CHAS. F. MUTT.

Cincinnati, O., Jan. 23, 1883.

BOSTON.—*Honey*.—One-pound honey, 20@22; 2-lb. honey, 20; Extracted, 10. *Beeswax*.—None except small lots at very high prices, say 35 to 38 cts.

Boston, Jan. 24, 1883. CROCKER & BLAKE.

NEW YORK.—*Honey*.—Our quotations on honey and wax are as follows: Fancy white-clover, in 1-lb. sections, per lb., 23 to 25c; fancy white-clover in 2-lb. sections, per lb., 20 to 21c; off grades white-clover, in 1 and 2 lb. sections, per lb., 16 to 18c; buckwheat, in 1-lb. sections, per lb., 16 to 17; buckwheat, in 2-lb. sections, per lb., 14 to 15; white-clover, extracted honey, in bbls., 9 to 10c; buckwheat, extracted honey in bbls., 8 to 8½c. *Beeswax*.—Prime yellow, 35c. H. K. & F. B. THURBER & Co.

New York, Jan. 24, 1883.

I have 3500 lbs. extracted honey for sale. basswood and clover, in kegs holding 150 lbs., for which I will take 10 cts. for basswood and 11 for clover, delivered on track at Farley, Dubuque Co., Iowa; if wanted in lots of 1000 lbs. or over, ½ cent off. The honey is first quality, well ripened up in hives. Samples sent if wanted. JAS. SCOTT.

Farley, Dubuque Co., Ia., Jan. 22, 1883.

I have 8000 lbs. of comb honey in ½-inch Langstroth frames; will sell at 14 cts. Also 1000 lbs. in 8-lb. boxes, glassed on one side, at 15 cts., delivered on the cars at Woodburn, Iowa. JAMES SPENCER.

Woodburn, Iowa, Jan. 10, 1883.

We have had a poor season for bee-keepers, but I can make a better report than some of my neighbors. I commenced the season with 24 colonies; got 1350 lbs. box honey, and increased to 37, all packed in chaff. I have 1000 lbs. honey in 1½ lb. boxes to sell, put up in crates of 16 boxes each; outside boxes, glassed, rander not glassed. Delivered on board the cars at Decatur, Van Buren Co., Mich., at 18 cts. per lb. S. H. MALLORY.

Decatur, Mich., Dec. 11, 1882.

I have about 1000 lbs. of white honey, and 500 lbs. dark honey, all extracted, for sale at 10 cts.

DR. A. B. MASON.

Wagon Works, Lucas Co., O., Jan. 20, 1883.

Every lady should send 25 cents to Strawbridge & Clothier, Philadelphia, and receive their *Fashion Quarterly* for 6 months. 1,000 illustrations and 4 pages new music each issue.

### NOTES FROM THE BRIGHT-BAND APIARY.

FRIEND KINGSLEY'S ADVERTISEMENT, NO. 1.

I AM glad to say, the bees of the Bright-Band Apiary are all snugly packed away for winter, and have been doing well up to date; even some three-frame nuclei have stood weather down to zero. So much for my way of packing, which I shall be glad to give at some future time.

But now I wish to turn to the fraternity, with an expression of thanks for the kind patronage given me during the past summer, in queens and bees. I also think I can be of service to a great many of you this winter. There are two things a great many of us need, but are without, on account of the high price generally asked for them, and that is, a hand-power buzz-saw and extractor. By proper management I am able to make and furnish either at a much less sum than is generally asked. I will first give you a picture of the saw.

PRICE \$25.00.

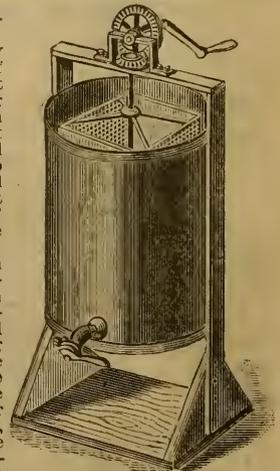

I am glad of having the privilege of bringing this saw before you all, as I have never seen any thing that would equal it, either in rapidity or quality of work. It is very handy, as one hand can do the turning and sawing too, and, at the same time, is not very hard work, unless you get into a "big" hurry. The whole thing is gotten up in first-class workmanlike style, and all you have to do when you get one is to put the crank on and go to sawing. Seven-inch saws will be used, unless some other size is ordered. All who have hives, queen-cages, section boxes, etc., to make should order one before spring.

And now for the extractor.

This is made very much on the style of Novices, only it is set in a light but strong wooden frame, which makes it convenient to set almost any kind of a vessel under to hold the honey, and about the right height to "save one's back." It also makes the gearing stronger.

Now, friends, both the saw and extractor are gotten up in first-class workmanlike style, and I shall take pride in trying to please all. Price of saw, \$25.00. Price of extractor, any size not larger than for Langstroth frame, \$5.75; for a larger size than this I shall probably have to charge a little more.

Very truly yours,  
CHAS. KINGSLEY.  
Greeneville, Greene Co., Tenn.

PRICE, \$5.75.

Vol. XI.

FEB. 1, 1883.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POST-OFFICE. Clubs to different postoffices, NOT LESS than 90 cts. each.

**NOTES FROM THE BANNER APIARY.**

NO. 39.

A HOME-MADE WIND-MILL.

I GUESS I shall have to be a little more careful about telling what I am going to do,—yes, or even what I am *thinking* of doing. For instance, on page 478 of October GLEANINGS for 1882, I remarked that I was “thinking quite strongly of building a home-made wind-mill on top of my shop, with which to run my buzz-saw.” Nov. 9th I received a letter from which I give the following extract:—

“Well, friend H., how about that wind-mill? have you made it yet? and if not, are you going to? and when it is finished, will you give us a photograph and description of it in GLEANINGS? I am just about crazy to know all about it. I have a foot-power saw that does good accurate work, but it needs more power than I possess to run it. A patent wind-mill costs as much as a steam-engine, and that is more than I can afford at present. I wrote to A. I. Root to see if he could help me contrive a cheap mill. He wrote me that he could think of nothing cheaper than the patent mill; but we *must* and *will* have something cheaper. Please let me hear from you.”

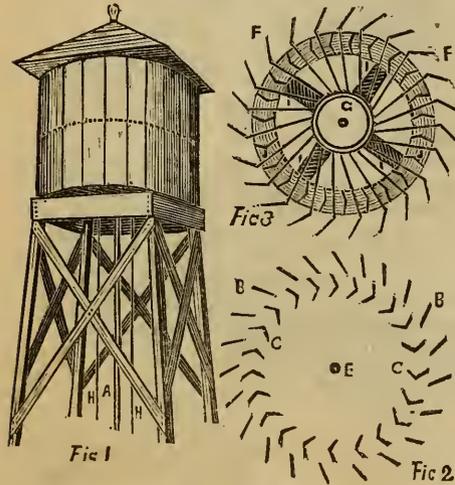

Now, neighbor P. has a home-made wind-mill that pumps the water, churns, and does sundry odd chores for him, and had I made a mill it would have been built upon the same plan as his. Soon after receiving the above letter it occurred to me that a drawing and description of my neighbor's home-made wind-mill might be valuable to some of the readers of GLEANINGS; therefore, as soon as I had leisure I took the sketching-camera under my arm and went over to neighbor P.'s. The whole family were interested in the sketching-camera, and then

what a time neighbor P., his boys, and myself had in looking for a good position! You see, the mill was so high that it was impossible to get a good view without going so far away as to make the picture too small. We mounted the straw-stack, climbed upon top of the barn, on top of the woodshed, and went inside the barn, climbed upon top of the hay-mow, and pointed the “machine” through the one or two knot-holes that we could reach. (I have always obtained the clearest pictures by placing the camera just inside the open door or window of an otherwise darkened room.) Finally, by building and climbing upon the top of a pyramid of boxes and barrels just inside the great barn-door, and sliding one of the doors partially open, a good position was obtained, a sketch of the wind-mill taken, and here it is.

This style of mill might be illustrated by placing the fans of a fanning-mill in an upright position inside of a hogshead or large barrel, the staves of which are made to overlap each other, and to turn upon pivots at their ends, as do the slats of a window-blind. In the illustration given, the blinds are represented as open, and it will be seen that the wind can readily enter and strike the left side of the fan-wheel, while at the right the blinds stand in such a position that the wind is deflected or turned from its course, and passes to the right, around the outside of the mill. A is the vertical shaft to which are attached the fans, or sails. Although not so shown in the drawing, yet the corner posts of the tower extend to and support the roof.

Fig. 2 is a sectional view of the mill as it would appear if cut in two at the dotted line shown in Fig. 1.

B, B, are the blinds, or deflections. C, C, are the sails; and it will be seen that, the better to "catch" the wind, these sails are not straight, but curved. E is the shaft. Now let us suppose that the bottom, or floor, of the mill is removed, and that somebody is standing underneath the mill, looking up at it, what he sees looks about like Fig. 3.

PLAN OF HOME-MADE WIND-MILL.

F, F, are the lower ends of the blinds, to the inner edges of which are attached, by means of staples, light iron rods, the inner ends of which are bent down so as to form right-angled hooks that drop into holes made near the circumference of the wheel G. As the blinds turn upon pivots at their ends, as do the slats in a window-blind, it will be readily seen that, by turning the wheel G, the blinds can be opened or closed at pleasure. Neighbor P. has a long rope, the ends of which are fastened to opposite sides of the wheel G; the rope then passes over pulleys and hangs down like a long rope swing. Pulling one side of the "swing" opens the blinds, while pulling upon the other side closes them. This rope can be seen at H, H, Fig. 1. Just above the wheel G, and the iron rods that connect it with the blinds, can be seen the spokes I, I, I, and rim J, J, of a wheel. At the top of the mill is another wheel exactly like this one, and it is between the rims of these two wheels that are placed, in an upright position, and nailed fast, the sails that receive the force of the wind. The rim of the wheel shown in the above illustration is represented as "transparent," which enables us to see the lower ends of the sails.

The lower ends of the blinds should not fit closely to the floor of the mill, but should be raised an inch or two, otherwise a sudden fall of temperature during a storm of rain or sleet will freeze them fast, making it impossible to open or close them. When a mill like this is used to drive machinery, and it is found necessary to do so, heavy ball-governors can be used, connecting them by means of levers with the wheel G. This kind of mill can be built by an ordinary mechanic; and there is but little liability of its being wrecked in a gale. The enormous head pressure, which causes a great amount of friction in all mills of the rosette pattern, is entirely avoided. It can be placed in the cupola of a barn, upon a shop, or upon a tower, as best suits the owner. The

sails receive the *direct* force of the wind, and that, too, at the periphery of the wheel, thus obtaining the greatest possible leverage, while most of the weight of the material lies at the rim, consequently imparting great momentum to the machine while in motion.

Neighbor P. himself built his mill, and the tower upon which it stands. The material for their construction cost \$15.00; that for the mill alone cost \$6.00. His mill is 6 feet high and 6 feet in diameter, and, with a wind having a velocity of 20 miles an hour, is about  $\frac{3}{4}$  horse-power. It is estimated that a mill 12 feet high and 14 feet in diameter would give 15 horse-power.

I am well aware that wind power is not the right power with which to run a factory,—it is too expensive waiting for the wind,—but bee-keepers who make hives for their own use only, and perhaps for a few of their bee-keeping neighbors, and who probably do their sawing by foot power, to such, I think, a good wind-mill would be a boon. They could have every thing in readiness, and when there came a windy day they could go into the shop and saw all day long. Then, besides, wind-mills can be made to furnish power for pumping water, sawing wood, cutting or grinding feed, turning grindstone, churning, etc.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., Jan. 4, 1883.

I am sorry to throw cold water on your home-made wind-mill, friend H., but this is a subject I have been pretty familiar with, in my earlier years. The mill you describe is very simple, and easily made; and if it gives the power needed, all well and good. But there is one very great objection to all vertical wind-wheels such as the one you describe. I once invented one, and submitted it to the editors of the *Scientific American*. The objection they gave was, that the wind could act on only a few of the sails at one time, while, with the horizontal wheels in common use, the wind is exerting a power on every individual sail, or bucket, *all the time*. Therefore, to get the same amount of power with a vertical wheel, we must make a very much larger machine; and, ordinarily, it has been decided to be more expensive in the end. Wind will certainly do a large amount of work, and that, too, without engineer or fuel; and we did at one time run all our bee-hive machinery with a 17-foot wind-mill, and for a time we ran with it the printing-press that printed GLEANINGS, as well. When one does the work himself, I like a wind-mill; but with hired help, that must stand still if the wind doesn't blow, it doesn't answer so well.

## CANDY FOR QUEEN-CAGES, AGAIN.

FRIEND HALL TELLS US HOW HE DOES IT.

I SEE some of the queen-breeders mention the waxing of the cage where the candy for the queen is to be put. Friend Root, we are the first to use this kind of a cage, so far as we have any knowledge. In the latter part of the summer of 1881 we first began to use wax where we put the water, and the past season we waxed every cage where the candy was put in the cage, and we shipped over 400 queens in 1882. You no doubt have examined our cage. We use light poplar wood for them, 2

inches wide, 1 inch thick. We bore one hole  $1\frac{1}{4}$  in., then bore one  $\frac{3}{4}$  of an inch. We nail a thin board on one side, and then pour hot wax into the  $\frac{3}{4}$  hole, which prevents the wood from absorbing the moisture. We next bore one hole into the other end with a  $\frac{3}{8}$  bit, boring it into the edge, and just far enough to let the tip end of the bit come through. We pour hot wax into this hole, holding it there until the wood absorbs the hot wax, then pour the rest back into the melting-pan. We then pack some cotton trimmings of cloth into the last-named hole; pour in water until the trimmings are thoroughly wet; then dip the cork into hot wax, and cork it up.

We make an opening into the cage so the bees can get the water. We have had great success with this cage. I think that, when the candy is properly made, and out of granulated sugar, that almost any kind of cage will do. Granulated sugar has been the most satisfactory with us. Some of the queen-breeders say they haven't lost a single queen in the mails. That beats us. We lost several before we began to use granulated sugar. If we could get a cage that would carry every queen through all right to our customers, without the loss of a single queen, wouldn't we be fixed then? and we could sleep well at night, after caging queens all day and sending them out, knowing that every queen would go through safely. We shall cage our queens 24 hours before shipping them (or some of them at least), to see whether it makes any difference. They would be reduced in weight and size; they would not tumble about in the cage as much as they would to just cage them right out of the hive, heavy with eggs, and clumsy. The mail-bags are roughly handled. We have seen the mail agent on the cars throw them out on the ground, and it is very heavy. Such handling is enough to kill the poor little bees. We want a cage that will protect the queen, no matter how roughly they are handled.

We are going to try our hand on a cage the coming season, for long distances, and cage our queens 24 hours before shipment; will not cage them in our mailing-cages until ready to ship. There is no business that we delight in more than rearing queens and shipping them; and one of the greatest pleasures in it is to have a nice good queen to fill all orders as they come, by return mail; and it is a great pleasure to us to receive cards from our customers, saying the queen arrived all right and in good order, and in due time, and that they are well pleased with them, and give satisfaction in every respect.

Kirby's Creek, Ala., Jan. 15, 1883. T. S. HALL.

I have just been puzzling over the way to fix the Good candy for our queen-cages next year. Very small glass bottles, with a large mouth, do very well; but we have much trouble in fixing them securely in the cage, because of the varying sizes we find in any thing made of glass. As wax is the natural receptacle for food for the bees, I presume a waxed hole will be as good as the bottle, and very likely cheaper; yet, for some reason or other, we have always made slow work where we are obliged to use melted wax, to say nothing of the daubing pretty sure to happen, unless expensive help handles it. I don't like to have the honey soak into the wood, because it doesn't look tidy and nice, and I don't want the honey to be absorbed from the sugar, so as to leave it dry, either. We shall see.

## THE WRITERS FOR GLEANINGS.

TAKING A LOOK AT THEIR FACES.

I HAVE for many years felt like having on the pages of GLEANINGS a view of some of those whom we learn to know so familiarly month by month, but I have been a little doubtful about getting engravings at a moderate price that I would want to use. We have recently found an engraver, however, who, I think, will do very well; and now, friends, I take pleasure in introducing to you, to commence with, our old and well-known friend

W. Z. HUTCHINSON.

He gave me his photograph at the convention, and also that of the twins. I haven't got the twins with him this time, but we are proposing to have them meet the little folks in our next JUVENILE, if our friend the engraver has good "luck" with them. You see, you would now all of you know friend H., if you should see him come in at a convention, even if anybody didn't say, "That is W. Z. H."

## HOW SHALL WE GET OUR COMB HONEY STORED AND MARKETED WITH LEAST EXPENSE AND LABOR?

SOME ITEMS OF EXPERIENCE FROM OUR FRIEND BYRON WALKER.

FROM numerous articles in the different bee journals, it seems that the matter of packages for storing and marketing comb honey is attracting not a little attention just now. Having raised and marketed about 50,000 lbs. of honey, put up in a variety of ways, in the last half-dozen years, I venture to offer a few thoughts on this subject.

As the bulk of my honey crop is usually taken in a few short weeks, often late in the season, when most bee-keepers are busy preparing their honey for market, and their bees for winter, I find it very necessary, in handling my apiary of about 150 colo-

nies, 'in order' to accomplish all the labor involved in these several objects, so as to secure the best results, to adopt those methods and appliances that will enable me to perform the greatest amount of labor in the shortest space of time; a necessity rendered all the more imperative, where competent assistance is not to be had, and at a time when, to supply the urgent demands of one's customers, is to rob your own apiary of the necessary sections, cases, and foundation.

Again, as my experience teaches me that one of the great obstacles to a ready sale of comb honey is the bad condition in which it too often reaches the dealer, I must have packages of such size and strength as will best withstand rough handling. Then, too, as it is a troublesome and expensive item to keep track of and recover one's shipping-cases, especially where shipping to distant markets, I find it pays best, and gives the best satisfaction to all concerned, to make use of cases which you can afford to give away with your honey. It is hardly necessary to add, that I must use packages of such sizes as will meet with the most ready sale, and bring the best prices. Now, may I not venture to conclude, that a style of package that will combine and secure these several ends is the one most needed? It is not my intention, at the present time, to mention in detail the various arrangements in use for securing and marketing comb honey, but rather to speak briefly of that which has given me so much satisfaction for the past three years, and which I expect to make use of in the future. It consists chiefly of one-piece section boxes, somewhat similar to those made by yourself, used in connection with a combined honey-rack and shipping-case; also nearly the same as that described by you in your price list. I sent you a sample of my section last year; but as I have reason to suppose that you either did not see this at all, or else, noticing that the ends were not dovetailed, you failed to examine it closely, I take the liberty to point out in what respects it differs from yours, and wherein I think it superior.

As I found by experiment what common sense teaches in theory, that timber that can be relied upon to bend at the corners of these sections without breaking is not dry enough to dovetail at the ends without shrinking, I avoid the use of timber that has been seasoned too much; make my section a trifle heavier than yours—5-32 inch instead of 1/8 in thickness; cut the grooves for the corners in such a way that the section will bend at the right points every time, without coaxing or compulsion, and join the ends with 1/4 No. 19 wire nails, instead of dovetailing. In this way I secure a section at least twice as strong, and one just as quickly put together as yours; for although it takes a little longer to nail them (I find, however, plenty of handy boys ready to do the work at 5 cts. per 100), a smart boy, with the aid of a simple steam-box, can bend mine at the rate of 50 per minute, while any one whose thoughts are busy in another direction can bend them several times as fast as yours can be bent by a skillful hand attending strictly to business. Allow me, in this connection, to refer you to the inclosed opinions of Oliver Foster, Mt. Vernon, Ia., and J. A. Green, Dayton, Ill, which I think you will admit are entitled to some weight.

I am happy to say, that your one-piece sections are decidedly the best of all I have seen. Your groove, with one side deeper than the other, is a

wonderful improvement. A boy whom I could not teach to fold the "Root" section right, folded yours every one right from the start with scarcely any showing.

OLIVER FOSTER.  
Mt. Vernon, Ia., Dec. 22, 1882.

Mr. Walker:—Your card of Jan. 4th is received. You ask for an opinion as to your sections. I will say, that during the past season I used over 6000 sections, of three different makes, and much prefer yours. You may send me 5000 sections now, and I shall probably want more later.

J. A. GREEN.  
Dayton, Ill., Jan. 8, 1883.

It is not that I have an eye to that inevitable five dollars, that I call your attention to this matter, for I could well afford, in the long run, to pay you ten times that amount, would you agree not to copy this improvement. Indeed, it requires no prophetic eye to foresee the early adoption of this style of corner by all manufacturers of one-piece sections; and the sooner this takes place, the better for the brotherhood of bee-keepers. I have said my combined honey-rack and shipping-case was similar to that advertised by you, differing chiefly in having the ends of an equal thickness throughout, and provided with a wide groove cut entirely across them for handles. Such cases can be used in the upper story of L. hives, by making the ends of cases only 5/8 in. thick.

It is a matter of not a little astonishment to me, that you have so few favorable reports to publish, from those using such cases without separators. Several correspondents seem to think their experiments prove that straight combs can not be secured without separators, and you appear to be so far wedded to the arrangement of wide frames with separators, that you seem to think it would be almost a calamity for the bee-keepers of our land to be obliged to lay them aside for something else; but I would say for one, that I could not be persuaded to return to their use, believing, as I do, that it was a matter of pure economy to throw them aside. As to the matter of securing straight combs without separators, I can say that, with me, at least, it is no longer a problem, having only found it necessary to use large starters in my sections, and a section not over 1 3/4 inches wide. Out of over 10,000 lbs. of comb honey taken in about six weeks' time the past season, only a small number of combs were irregular, and these were chiefly in cases where wide sections were used. Had I been obliged to rely upon wide frames and separators to have taken my crop with during this time, with the help I could command from a couple of boys in preparing every thing for the purpose during the rush of the season, with orders for sections, etc., pouring in upon one, I imagine I should have had a much smaller yield to report (I took in all from about 100 colonies, 10,500 lbs. of comb honey, and about 3000 lbs. extracted, with an increase of 50 colonies), and by the time I could have prepared it for market it would have been worth several cents less per pound, and the preparation of my bees for winter would have been neglected.

You state, in your price list, that honey put up in such shipping-cases as I have described, usually brings several cents less per pound than that taken with separators, and packed in ordinary shipping-cases. Even if that were the case, I should much prefer to use them; but I find that my honey sells in the Detroit market as readily, and at as high a price, as that put up by some of my neighbors the other way. It does very well to handle over your honey several times, if you use firmly nailed sec-

tions, have plenty of time to waste, very, very careful hands, and a market you can reach readily with a spring wagon; but if you can't compass these conditions, and have to ship your honey to some distant market by rail, as I did to Chicago, two years ago, and to Buffalo, in part, the past season, you will find that the less you handle your honey, and the stronger the section you use, the happier will be the result of your venture, other things being equal; and you will be more fortunate than I have been if your honey in dovetailed sections, and especially that re-packed in any way, does not bring you several cents less per pound, rather than more than the other. True, the glasses of these cases are sometimes soiled with propolis, and the sections more or less firmly fastened to each other and to the case by the same substance; but it is only a trifling matter to exchange such glasses for others in the one case, while it is just what is need to help withstand shocks from any cause during transportation, in the other.

To give an idea of what honey will stand when put up as I have described, I will relate an incident. This fall, while loading a lot of honey into a car, I had about a dozen 20-lb. cases of 1-lb. sections on a cart, piled about three feet high, when an assistant carelessly lifted a couple of them off from the wrong end of the load, causing the rest to be dashed to the floor with great force. Upon examining the wreck I found only two cases that were materially injured, a third having one section broken. Comment is unnecessary. There are other advantages to be gained by the use of this case that I have only time to hint at in this already too long article, such as facility in tearing up, and in excluding the queen from the sections, by properly spacing the bottom slats of the cases, also in starting the bees at work in the sections by fastening the starters to the ends of the sections instead of the tops, and standing the cases on end between the outside combs of the brood-nest; after which they can be readily raised to the top for completion. This latter plan works best where frames having closed ends are used, and the length or breadth of your case is equal to the depth of your frame.

With regard to different sizes of sections, while various sizes will be necessary to suit all classes of customers, the 1-lb. package is too popular at present to be easily superseded by any other size.

I would suggest, however, that where pound and half-pound sections are to be used in connection with these cases, without separators, it would be best to have them made after the style shown in the following diagram with projections  $\frac{1}{8}$  inch:—

The idea is from Chas. Bellows, Vermillion, D. T. You will notice, this does away with the projections objected to by Mr. Heddon, and allows the bees to pass freely from one section to another the whole length of the case, and it may help to secure straight combs where the sections are not filled with fdn. Besides, would we not avoid using the only feature of Fornerook's section on which he stands any chance of sustaining a patent? I can see no objection to this plan, and shall give it a trial, at any rate. It may be better to use two projections instead of one on both edges of each end.

Capac, Mich., Jan. 23, 1888. BYRON WALKER.

Friend W., I did get your one-piece section, and noted your improvement, although

I did not quite take in the idea that your section could be doubled up just as quickly as those with the V-shaped groove. We did not adopt your section, because we had quite a number of complaints from them; and among them was the very friend, Green, who now gives the above testimonial. Another thing: If we should stop our works, and alter our machinery to meet the views of every brother who writes us and sends samples, we should never fill orders at all, nor do much else. Thank you for calling attention to the matter, even though you do it a little vehemently. Had you been at the convention at Kalamazoo, I think you would have heard me call attention to the fact that an immense trade was springing up in this combined crate and case, used without separators. Now, friend W., please send me one of those cases, arranged for the narrow sections you mention, and we will have it engraved for our next issue; also please answer the following questions in regard to its use:—

1. Do you tier these cases up, one above another? If so, how do you manage it so the bees do not soil any part of the section with propolis?

2. Do you put sections at the sides of the brood-combs in any other way than the one you have mentioned?

3. Do you let the bees work in each case until it is filled and capped in every section? and do you raise up one partly finished and put an empty one under it?

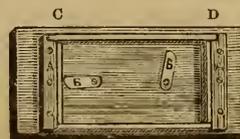

4. Can you space the wooden bars on the bottom of the crate so accurately that it will answer as a perforated zinc queen-excluder? If so, give a little of the details.

If I am correct, you do not quote quite fairly from our price list. The objection to a section made as in your diagram is the amount of room afforded the bees for propolizing the edges. I am informed by competent authority, that our friend Fornerook has no chance for a valid patent on any point, and never had.

## DEVICE FOR MAKING "HOME-MADE" FRAMES.

BY REQUEST OF ONE OF OUR JUVENILES.

**A**T the request of my little girl I make a picture below of the apparatus I use for nailing frames together. Of course, this would be of no use to those who use dovetailed frames, such as you sell, but I think a large majority of bee-keepers still use frames nailed together, and nearly all of my bee-keeping neighbors, who are not mechanics, make very awkward work nailing frames together without such a help. The apparatus is merely a

piece of board with two cleats, marked A, A, screwed fast to it, just as far apart as the outside width of frame. Of course, the width of board and the length of cleats should correspond with the depth of the frame; the top ends of the cleats should be notched as shown, so that the distance from C to D would be equal to the length of the top-bar; the object of

these notches is, that the projecting arms to support the frame may be made equal in length on each side, without stopping to measure it. The buttons marked B, one in place and the other turned up, are to hold the end-bars in place while nailing, and are fastened to the board with one sew.

I used to nail my frames together without any such help; but since I have used this I find I can nail them twice as fast; and another advantage is, that they are perfectly square, and are not winding, as they frequently used to be. It took me about twenty minutes to make the "concern," and I saved more than that time on the first hundred frames I put together.

E. HUNT.

Sheridan, Mich., Jan. 8, 1883.

### HOME-MADE BINDERS FOR GLEANINGS OR OTHER JOURNALS.

ANOTHER PLAN SUGGESTED BY ONE OF OUR BEE FRIENDS.

**I**N last Jan. No. I read a description of how to preserve GLEANINGS, by T. J. Cook. The illustration shows how I preserve all my periodicals. A, A, are leather straps, two inches shorter than the papers I wish to bind, and one inch wide. Punch 3 holes at equal distances in the strap, large enough to pass a shoe-string through; punch corresponding holes of same size through each number of the paper, Dec. No. first, next Nov., etc., until January is

on top; then place one strap on top, the other at the bottom, then run the shoe-lace (a stout one) as indicated above, No. 2; draw them tight, then tie them at B, and the work is done. If care is taken to have each hole correspond with the succeeding one in the several numbers, you will have a pretty neat job of it that you need not be ashamed of. I got the idea some years ago from the *Poultry World*, for I love bees and thorough-bred poultry.

JOHN W. STURWOLD.

Haymond, Ind., Jan. 10, 1883.

Thanks, friend S. Perhaps I am mistaken, but it has seemed to me that leather would be rather too yielding, to draw the numbers up strong and tight. Would not stiff pasteboard under leather be better? And while I think of it, why not have a pasteboard cover for each side? We all have had experience with books with paper covers, and know how easily they get torn and "dog's-eared." I have been thinking of late, several times, that I almost never

wanted to see another paper-covered book of any kind that was of any value. For a while we were out of paper A B C books, and, to avoid delays, sent cloth, and asked the difference, if satisfactory. Almost every one expressed himself pleased to pay the difference and have a nice strong covered book. Well, we have a few times tried sending paper-covered books when we were out of the cloth. Whew! you ought to have seen how the brethren scolded. We had to have the most of them sent back. Well, to go back to the home-made binder, if you have some sheets of pasteboard cut nicely square, you can cover them with some nice colored paper, blue or green, for instance, and then paste a white sheet on the inside, and the front cover to GLEANINGS on the outside, then use the binding arrangement above, and you have a book that your grandchildren can pull down from the shelf to look at the pictures, and note the progress in bee culture, years hence, if you choose. One of our girls binds our Postal Guides in a similar way, and they make very pretty-looking books. Our engraver has made a funny blunder and got the binder on the front edge instead of the back.

## "Remindery,"

Or Department for duties to be attended to this month.

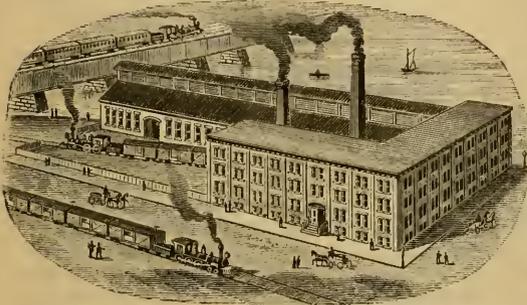

### SUGGESTIONS FOR FEBRUARY.

**W**ITH many of us the bees are likely to have a fly this month, where kept out of doors. Where kept in doors, I would not disturb them, unless things are in a very bad state indeed. Darkness, and plenty of good pure air, will usually keep them quiet, although some folks do contend they should have water. If giving them water keeps them quiet, perhaps it will be well to give it to them quietly. Go slow in adopting new ways of doing. I think I would rather have bees kept in the cellar until natural pollen comes, if they are not suffering with dysentery, or are too warm and uneasy. Bees out of doors may be handled whenever it is warm enough for them to fly, but I would not handle them unless it is warm enough. If they are properly protected and ventilated, and good food is all around them, they can fly when they get ready, or not fly, as they choose; and I do not know what need there is of disturbing them, unless it is to see that the entrances are not choked with dead bees. If the entrance to the chaff hive is left open all winter, as I think it should be, there will be little danger of its getting stopped up; but if any hive should not fly when the rest do, it might be well to take a peep into the entrance. If the severe weather has killed off any colonies, either fasten the hive up securely, or put the combs in a tight honey-house, where no bees can get started robbing on them. Robbing, started in the early spring and winter, is a very bad thing, and be sure you have none of it.

## A FEW WORDS ABOUT SOME SUCCESSFUL BUSINESS MEN.

W. F. & JOHN BARNES, ROCKFORD, ILL.

SOME of our older readers may remember the experiments we made with foot-power saws for making hives and section boxes, something like ten years ago. You will remember that I decided in favor of a machine costing only \$35.00, in preference to one that cost over a hundred. The cheap machine was made by the gentlemen whose names appear at head of this article. We have sold machines of their make, every year since then, and it has been with pleasure that I have noticed the steady increase of their business from year to year. At the Centennial I was pleased to meet one of the brothers, and shall always remember him as a bright, good-natured enthusiast in his business of showing and explaining what could be done with foot-power saws. Below we give an engraving of their factory as it appears in this present year of 1883.

The material used in this building is brick and stone. The main machine-shop, shown on the extreme right, is 150 ft. by 40; the front portion of the L is also 150 ft. by 40. The office in the left end of the front L, where two men are seen, is 40 by 50. The rear part of the building, facing the Rock River, is the foundry and smith shop, 250 ft. by 60.

## A COUPLE OF A B C SCHOLARS IN KANSAS.

THEIR TRIALS AND SUCCESSES.

MY wife and I are bee-keepers on a small scale. I commenced last June with two colonies of Italian bees. They were about as nearly starved out, I presume, as bees ever are to pull through all right. I thought I knew a little something about the science of bee-keeping, but I soon found out I was as green as grass; and the more I worked with my pets the more mystified I became, and at the same time interested. I finally subscribed for GLEANINGS, and that made the fever worse. I bought Cook's Manual and your A B C book, and of course I learned a great deal; but it seems to me the half has not been told, and that there are "mountains" of information yet for me to learn. I feel now, when I do not think of it, greener than I did the first of last June, when I had no experience, nor your A B C book, Cook's Manual, or GLEANINGS for a guide. I had fertile workers during the sea-

son, and robbing, and the "contrariest" and most aggravating swarm of bees, I thought, on earth. It was an after-swarm that would swarm out, and then go back into the old hive. They kept up this foolishness once or twice a day for five days; and after they had eaten all of their honey in the old hive, they got disgusted, as I then thought, and concluded to stay in a hive I had been putting them in, and went to work. They were the best workers I had in my little apiary, afterward working all day until dark, with a rush.

In the midst of a honey-flow the 10th of Sept., three days of dry hot winds dried up all the flowers, and the honey season was ended, and robbing was in order. The colonies were all strong, except one. This the other bees attempted to rob. I was a little better posted by this time. I tried all of your plans and Prof. Cook's, without success, except the last. I moved the hive two miles into the country, and it was a success. I brought them back a fair colony late in the fall, and put it in the cellar. I call it my nucleus. I have at present 5 strong colonies and the nucleus; one colony in chaff hive, 2 packed in chaff in Simplicity hives, and on their summer stands; the rest I put in the cellar. My five colonies went into winter quarters with about 40 lbs. of honey to the hive. I got something over 200 lbs. of comb honey, without fdn. One colony made 105 lbs. surplus, and all in a country that does not furnish honey, as friend Dearbon, of Silver Lake, Kan., said in the last June No. of GLEANINGS. Silver Lake is only six miles from here, and a good deal such a locality as this. Perhaps he may be right, as one season would not disprove it.

### SMARTWEED,

Or a weed that looks like the old-fashioned smartweed, grows thickly everywhere in corn-fields and on wheat-stubble that has not been plowed up. It furnished the honey here, and is of a very superior quality. Some speak of it as being equal to white clover. Will some one in GLEANINGS tell whether it can be depended upon as a honey-plant? Does it afford honey every year, and how long is its season to yield honey? I couldn't find any thing in any of the bee literature as to its value as a honey-plant.

My wife helped me with the bees. She has the bee fever also, and caught it from her husband. Often in her sleep, during the time when the bees were swarming out last summer, she would wake me up in the night and say the bees were all over the bed, clawing around and brushing imaginary bees off the pillow until she would wake herself up. She is reading and posting herself up this winter, and says she will allow no such foolishness and cutting-up and swarming-out so often next season as we had last. I call her "Mrs. Harrison," as she admires that lady's letter in GLEANINGS so much; and, by the way, she thinks GLEANINGS is just splendid, and so do I. We have no little ones, only our bees for pets. The thermometer has averaged 17 degrees below zero for the past three days—the coldest known for years in Kansas. M. F. TATMAN.

Rossville, Kans., Jan. 22, 1883.

I am very glad to know you succeeded so well, my friend; for over 100 lbs. of comb honey to the hive might encourage almost anybody, for the first season. I wonder if other bee-men's wives, a few of them, have

not dreamed of bees, and made things lively for awhile.—The plant you speak of is called by some heart's-ease, and by others blackheart. Its botanical name is *Polygonum persicaria*. As it always comes into weedy corn-fields in the West, I presume there is little need of cultivating it as a honey-plant.

### THAT FLOWERING MAPLE.

#### HOW TO PROPAGATE IT BY CUTTINGS.

ON page 31, Jan. No., E. Edmunson writes about the abutilon yielding honey. I have known for several years that there are two or three species of them that are secreters of honey of fair flavor, but I never owned any of them myself. You also asked if some of the "sisters or other womens" won't tell how to propagate them by slips. Well, I am no "sister," nor "other womens'" sister; but "I iz a man that noze how 'tis dun, so I'll tell you awl."

A number of years ago I worked with an expert gardener in a large greenhouse, and there learned the principles of the art of propagating plants in various ways. But not having a propagating-house of my own, I have many times used its substitutes, one of which I will try to make plain.

Take a deep goblet, tumbler, or a fruit-jar, or a bottle with the top broken off. Put some good-sized pebbles, pieces of coal clinkers, or any thing else in the bottom, to fill the article within 3 inches of the top. Now put some smaller ones in to chink up the cracks in the top of the pile, so that there will be nothing but small crevices left, and yet all beneath this top layer needs to be kept just as open as possible, to make a space for water.

Now take some good rich garden soil (not chip dirt), and the same bulk of sand, — I like river or clean road sand best, — and fill up the rest of the glass with the mixture. Be sure to mix the sand and dirt thoroughly. Wet it till the water runs through and nearly fills the spaces full among the rubbish in the bottom of the glass. If your job is properly done, very little if any of your soil will wash between the pebbles.

You are now ready for the cuttings. They should be the young tendershoots at the tips of the branches, from two to four inches long. Stick these *tight to the glass*, and as close together as you have a mind to, all around the glass; then set the glass close to the window, in the full blaze of the sun, only watering often enough to keep some water in the bottom of the glass. Don't be afraid the things will die, if they do wilt some; nor if the soil looks dry on top, think they must be watered; but just make up your mind that, as long as you see water in the bottom of the glass, the water must evaporate through the soil. If your cuttings are good, and it has been pleasant weather, in 10 or 15 days you will see the roots start. When they are an inch or two long, make the soil quite wet; then carefully pull out the best-rooted ones and put them into small pots in good garden soil, and give a good watering. Set in the shade for two or three days, then give them a strong light. Small pots, or even spice-boxes, are good; but to put one of these young plants into a large pot or box is like feeding an infant with food needed by a strong hard-working man, and it would do as well. I have put nine cuttings in a goblet that

had the bottom broken off, so I hung it by three strings to a nail in the top of a window-case. Foliage-plant cuttings, with only two leaves, being a single joint of young growth, have rooted in one week for me by this treatment, and I have taken three batches of plants from a glass, all well rooted, within five weeks.

In 1882 I had a piece of a choice foliage plant 10 in. long, with four pairs of leaves and two small leaves. I cut off each of the three pairs of large leaves to make a cutting; thus I had four good cuttings. The two pairs of oldest leaves were split in the center of the stalk, leaving a leaf and perfect bud on each piece, with about 1½ inches of split stalk below each leaf. I then had six good cuttings. All of them lived, and in two weeks were all rooted and in separate pots. This was done the last week in March, and furnished me six good plants for the border, that surpassed any of the ten-cent plants from the florist.

Verbenas, heliotropes, petunias, and all of the bedding plants, as well as many of the choice greenhouse plants, are easily raised in this way. I have tried the plan for twelve years, and know it's good.

Woodbury, Ct., Jan. 19, 1883.

H. L. JEFFREY.

### DON'T SELL YOUR HONEY WITHOUT KNOWING WHAT IT IS WORTH.

MRS. HARRISON TELLS US SOME OF HER TROUBLES.

BEES-KEEPERS tread on my corns oftener in the way they dispose of their honey than in any other. Dealers say that they never saw honey so plentiful in Peoria before as during the last State fair. We do not wish our fellow-craftsmen to think that we claim a "patent right" on this market, for all have the privilege of selling where they can do the best. The *hurt* is not in coming here to dispose of their honey, but in forging it upon the market at a price less than the cost of production. A groceryman remarked to us yesterday, "If these men who brought their honey here during the fair had worked up their own locality, they would have realized much more money. But they would say, 'I have the honey here, and I must sell it; I don't want to take it home; name your price.'"

It takes some time for people to be willing to pay a fair price for an article after they have purchased it so cheaply. This cheap honey, though, has its mission: it will create a demand where it never existed before, as many persons bought it who would not have done so, if it had not been cheap. And they learned what they probably never knew, that honey "is good." These bee-keepers (in a small way, no large ones are ever guilty of such folly) paid dearly for thus educating the people.

There are few country neighborhoods where the product of fifty colonies of bees could not be sold to advantage. We once visited a bee-keeper who lived five miles from any town, who had an apiary of about 50 colonies, well cared for, and run exclusively for extracted honey. He said, "I sell all my honey at home, to the neighboring farmers, and I could sell much more if I had it, but I could not nearly supply the demand."

The products of large established apiaries find no difficulty in finding a market; but that of small apiaries is different. The market must be worked up. The best way to sell in towns or large cities is to leave the honey at home and canvass with sam-

ples, visiting drug-stores, groceries, etc. If the owner has not any work that will pay him any better, large orders might be taken by visiting manufactories where many hands are employed, choosing their lunch-hour as the most propitious time for the visit. We have found some very good honey customers, while purchasing our household supplies, by offering a small quantity of honey, and paying the rest in money. Mrs. L. HARRISON.

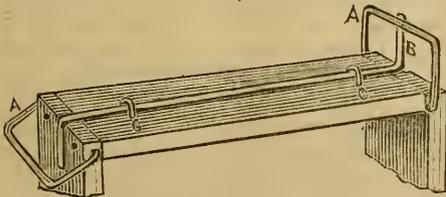

Peoria, Ill., Jan., 1883.

It is bad to sell honey, or any thing else, for what it will bring, to folks who do not particularly want it. On this account I would dislike to take a load anywhere unless I had some sort of an idea how I was to dispose of it. Your suggestion, Mrs. H., that it were well to go first with samples, is an excellent one, unless you are prepared to take the load home again, unless a fair price be obtained. If our friends will always mention what their honey sells for, in making their reports, it will do much toward informing all who read the journal about how much they ought to ask for their honey.

### REVERSIBLE FRAMES, AGAIN.

FRIEND BURGESS, AND HIS IMPROVEMENTS OF THE PAST YEAR. SEE P. 71, FEB., 1882.

**A**BOUT a year ago I sent you a sample of my way of making the "reversible frame." You suggested two bearings instead of one. I accepted your idea, and now inclose a *shortened* end of the frame, as I make it. You will notice that my end-

pieces go between the top and bottom bars so the wires hold all tight together. Your illustration was the reverse. In wiring for fdn. I use 6 wires across my frame — the end ones, one inch from the end-piece — you will notice the holes made. As I turn the frame over from time to time I need no *diagonal* wires. The wire bearings are made by winding around a  $\frac{3}{8}$ -inch bar of iron, and then cutting them open on one side. The top and bottom bars have a saw-kerf near the end to receive them. The upright wire support is held in place by two staples, such as are used in blind-making, placing them  $1\frac{1}{2}$  inches from each end. I think a good many would try a few *reversible* frames, if you kept them in stock.

Recently a man wrote me, that, by turning over the frames of a *Simplicity* hive, as you suggested, he secured 18 boxes of honey where the bees had determined to put it into the brood-frames. They do not like to have the honey part of the frame put at the bottom. F. W. BURGESS.

Huntington, L. I., N. Y., Jan. 12, 1883.

When our friend sent the model of his reversible frame a year ago, I told him it would not do to let the frame hang on a single wire. You will notice in the one shown above, he has very ingeniously, indeed, so arranged it as to have a firm double support

like our metal corner, and at the same time it permits the frame to be turned over at pleasure. While I think it quite possible that we may get a great deal more of the honey put into sections by this reversing, it still seems to me the best way to do it will be to have a hive with a movable bottom like the *Simplicity*, and turn it all over, placing the sections over the bottom-bars instead of the top-bars.

### THE MAN WHO DIDN'T WANT ANY "BEE PAPER."

ALSO A GOOD WORD FOR THE CONTROLLABLE HIVE.

**I** SEND you the following account of an interview I had with a bee-man who uses Mrs. L. Cotton's hive. I was in a neighboring town the other day, when he was pointed out to me as a bee-man, and I accosted him with "Hello, friend, they tell me you are a bee-man."

"Y-a-a-s, I keep bees."

"Well, I suppose you take a bee journal, do you not?"

"A *what?*"

"Why, a bee paper."

"No: I never take no bee papers, an' I don't want any."

"But, you have books on bee-keeping, have you not?"

"No: I never could learn nothin' from books and papers."

"But, didn't you attend the meeting of our County Bee Association?"

"Y-a-a-s, I was up there, but I didn't learn nothin'. I could 'a' told more in one-quarter the time than them fellers did."

"Why, you must be an old hand at it, aren't you?"

"Y-a-a-s, I've kep' bees 'bout 20 years, I guess, but didn't handle 'em much till 3 or 4 years ago."

"How was that?"

"Why, ye see I began makin' a different kind of hive then, and I seen some men handle bees, and I learnt so I kin handle bees just as good as anybody kin, now."

"What kind of a hive do you call it?"

"Well, I call it the *con-trol-able* hive, and I tell you it's the best hive there is made."

"Oh! ah! something new, isn't it?"

"Well, I guess there are none about here."

"It was not got up about here, then?"

"No: I sent off for it."

"Who is the inventor?"

"Her name is Lizzie Cotton."

"I suppose you have good success with her hive?"

"Yes, *sir*."

"How much is the highest you ever got from one swarm?"

"I got 135 pounds."

"Well, that isn't to be sneezed at, any way. How did your bees do this year?"

"Pretty poor. I guess I had 400 or 500 lbs., however."

"How many colonies had you?"

"How many *what?*"

"How many hives of bees?"

"'Bout 25, I guess; but it's been an awful bad season. Wouldn't have got much if it hadn't been for feeding in the spring; and I tell you, I've got the best feeder you ever seen."

"Is that so? guess I'll have to come around and see it. Who got it up?"

"Got it up myself, and it beats any thing in the united world!"

At this juncture I had to tear myself away from this enthusiastic inventor, as I had other business on hand than the pursuit of bee lore.

Oberlin, O., Jan. 22, 1883.

CHALON FOWLS.

### HALF-POUND SECTIONS.

FRIEND MORRIS' EXPERIMENT, AND WHAT HIS WIFE "POLLY" THINKS ABOUT IT.

**A**S the ½-lb. section (like Mrs. Langtry) is all the talk now, I will give my little experience. Last August one day, says I to my wife, "Polly, I've thought of something. If I cut a 4¼ x 4¼-lb. section through the center, putting fdn. in each half, wouldn't the bees make half-pounds of honey?"

"Well, perhaps," says Polly; "but, what is the object?"

"Why, don't you see?" I said; "something new."

Like all other inventors, I never thought for a moment that some one else had thought of and put into practice, long ago, the same idea.

"Well," says Polly, "what's the use on't? You can sell all the honey you can possibly raise in 1-lb. sections at a big price now."

"But, Polly," says I, "I can get a bigger price per lb. for my honey."

"But, don't you see," says Polly, "you would have to get nearly twice as much for your half-pounds, to get your pay for your extra work and expense, double the amount of sections at nearly the same cost per 1000, double the amount of work in putting together and putting on and taking off the ½-lb. section? and besides, you are only catering to a morbid taste of a dissatisfied people who are always clamoring for something new. You men are as bad as we women. You want to change the fashion as often as we do. A 1-lb. section has been the fashion for a year or so, and now you must have a change, just as you have every thing cut to fit. A round section has been proposed and made, beautiful to look at too; now a ½-lb. section is the rage. Next you will want a section cut bias, with two rows of buttons up the back. And then, again, it would double the amount of fdn., and beeswax is getting scarcer. Comb fdn. is crawling up higher and higher in price, and you must study how to economize its use, instead of how to use more of it."

"Nevertheless, Polly," says I, "I am going to try one colony."

So I took 11 strong brood-frames and split in two 44 4¼ x 4¼ sections; of course, each frame held 8 of the ½-lb. sections, making 88 sections. Then filling each with nice large starters I hung them over a strong colony, fixed the hive perfectly level, and "let 'em went." They were filled and capped over nicely; but to ship, they are no go. They weigh a little over ½-lb., and are bulged just enough so that they can not be crated, and they do not stand well. Half-pound sections will have to be made wide enough to hold the honey inside the section. But I think I shall take Polly's advice, and stick to 1-lb. sections for a while yet.

By the way, as the question of separators or no separators is up, I will remark that I have found

that, if I take *perfect* fdn., put it *exactly* in the center of the section, and a full-sized starter; put all the sections on the hive at once, have the hive *perfectly level*, and then don't meddle until the bees have finished the job, my word for it, 95% of sections treated that way will crate nicely, and will overrun 5 to 10 lbs. on a hundred, while with separators they will fall short. But there is no use of a bee-keeper trying to get along without separators, unless he is as exact as a watchmaker; and he must beat the Waterbury chaps at that.

TAKING BEES TO FLORIDA TO WINTER.

I think we Northern bee-keepers shall have to try the following plan, which I clipped from the Chicago *Inter-Ocean*:—

On Saturday a car containing a curlous freight was switched on the East Tennessee and Virginia Railroad and moved South.

It was filled with bee-hives. One hundred and forty of the latest style of bee-hives piled systematically on top of each other, and to the foreground a philosopher with his bed and board.

"Where are you going to take your bees?"

"To Florida for the winter. My name is Thomas McFarland Jackson, and I live in Northern Missouri. I have large apiaries that are forced to lie idle in the winter. I'm going to take this carload of hives to Florida, where they can make honey every day in the year. As soon as the clover is out again in Northern Missouri I will take them back there."

"Will it pay you to move them?"

"I think so. It costs less than a dollar a hive for transportation, and each hive will have from \$6 to \$7 worth of honey in it when I bring it back. That is what Italian bees I sent to Florida last year did last winter. Only Italian bees will thrive in Florida, as the moths eat up the common bees."

"Will you live in the open air there?"

"I'm going to camp around with my bees. I believe I will bring back about \$1000 worth of honey in hives that would otherwise lie idle all the winter, and be empty in the spring."

Rantoul, Ill., Jan. 24, 1883.

H. M. MORRIS.

Friend Morris, we are very much obliged for the results of your experiment, as well as for the wise counsels of your good wife Polly. Thanks, also, for a report of that Florida project. We must try to follow up friend Jackson, and get him to tell us about how he succeeds.—Now about your ½-lb. sections: While reading your account I was hoping all the way through to hear that you tried a 1-lb. section, without splitting it in two; *i. e.*, that you by means of two sheets of fdn. made them build two combs in one section. The idea is not mine, for I remembered it from the card below. See:—

I feel moved to "put in my lip" about the half-pound sections. Make 'em just like the pound section, only run a groove the whole length of the strip, on the back side. When folded, put in *two sheets of fdn.* Harvest, crate, and market without dividing; but let the grocer's clerk pull 'em in two when he retails 'em. The halves, when parted, will not be quite half-pounds; but city folks are so stingy they like 'em the better for that. Won't be shouting for a half-ounce section so soon, eh?

Richards, O., Jan. 5, 1883.

E. E. HASKY.

Well this looks to me the most promising of any idea we have yet had. No separators are needed between the two, for they are never taken apart until they are sold, and so we have a great gain here. Another thing: Those who have 1-lb. sections on hand can make them into ½ lbs. by simply running them over a fine slitting saw that will cut so nearly through they may be easily separated with a penknife after they are filled. I

should think these slits could be sawed for about a dollar a thousand. Now, why will not this answer, for the present season at least? Has any one ever had two nice combs of honey in one section?

### NORTH-EASTERN BEE-KEEPERS' CONVENTION.

A REPORT OF IT BY D. A. JONES, "HIS OWN SELF."

**W**ELL, brother Root, you missed a great treat in not being at the North-Eastern Convention at Syracuse, on the 9th, 10th, and 11th insts. They are a lot of jolly, good fellows, brim full of apiculture, not married to any old-fogy notions, but bound to advance and keep pace with the times. I calculate that it was worth three times the cost of the journey to me, just to sit and listen to the "big guns" of New York State, who had come there to "Doo-little" but talk bee-keeping, and "Root" up every new idea, so that you could see it plainly before you; and as they had a "House" for a secretary, you will be sure to see it all in print.

Your humble servant was called on to explain and illustrate the best mode of putting up extracted honey in order to increase its sale and consumption; and so, securing a small tin pail of beautiful basswood honey, taken there on exhibition by Mr. L. C. Root, of Mohawk, N. Y., and, not having a spoon, I dipped it out as rapidly as possible with my knife, and was illustrating the best plan for putting up the honey to my entire satisfaction, when brother Root, seeing the manner in which his honey was so rapidly disappearing, admitted the value of my system, as did all the rest of the brothers present, feeling assured as they did that any quantity might be so disposed of.

I suppose that you will have the pleasure of their acquaintance next fall at Toronto, as the convention accepted my invitation to be there, and meet with the members of the North American B. K. A. They passed a resolution to be present as a body, and to bring their wives and daughters with them.

The half-pound sections were very severely criticised, and there seems little desire to adopt them, excepting as a curiosity.

I judge, from the intelligent discussion on wintering, that the majority of the members of the association have the matter well in hand, and that little loss may be expected from that quarter.

You may expect a very large trade in those new honey-packages the coming season, as nearly every one who produces extracted honey is beginning to see the advantage of putting it up in standard packages, nicely labeled, and each label bearing on its face the name of the producer; of establishing a home market, and realizing at least one-half more. The small-sized packages are serving excellently as introducers, and are increasing in sale tenfold.

Perforated metal will be much sought after during the coming season; and as yourself and brother Muth, of Cincinnati, O., are the only ones holding large stocks in the U. S., you may expect a lively trade.

I have almost "Given" up all hopes of seeing the Given press exhibited. It did not put in an appearance at the N. A. B. A. Convention at Cincinnati last fall, while Mr. Vandervort's and your own interest is so many; nor did it appear at the North-Eastern, though Mr. Vandervort's was there and in opera-

tion. Mr. V. received orders for 10 or 12 machines, so that you will notice this as a further proof of mistaken economy on the part of those who do not place their goods on exhibition. Further, it forms one of the interesting features of the convention, and we are allowed to compare and judge of the respective merits of the articles on exhibition.

In the future I hope that any one who has any thing of merit to show will make it a point to have it present at the various conventions. There has been so much said and written regarding various machines, appliances, etc., appertaining to our business, that it would be really interesting to know what position and rank the varieties would be awarded when thoroughly tested side by side. As in the past, so may some in the future, endeavor by fine-spun theories to evade these tests; but still no amount of ink and paper will convince like the actual test. "Seeing is believing." If we can have a large exhibit in every department, our convention will be one of the leading attractions, and many will become interested while examining our bee-museum, will join the association, and embark in our fascinating pursuit.

D. A. JONES.

Beeton, Ont., Can., Jan. 23, 1883.

Well done, brother Jones. I had almost settled down into the opinion that you were getting to be altogether too busy to write for a bee journal; but here you come, as fresh and genial as if you had nothing else in the world to do but to sit and listen, and then tell the journals about it. I know it pays to go, and I know I ought to go; but an absence from home of three days piles my work over me so for a week or two that it almost uses me up; whereas when I am at my post, and keep it abreast of me, I can manage to breath pretty freely most of the time. It does us good to hear the names of the "big guns" you mention, and I know conventions are an excellent thing for our people and the world at large. I am glad of the exhibits, too, and that our conventions are drifting into a sort of fair of bee implements and products. I see, too, that God's hand is in it, in getting us all better acquainted, and, as a natural consequence, better friends.

### A BRIGHT CONCEPTION.

RAISING BEESWAX FOR MARKET.

**I**N GLEANINGS, some one asks, what the small scales are on bottom-board of hives, having a large surplus of such. Your answer is, if I rightly remember, that feeding some kind of sugar is the cause of an over-production of wax scales. Now, if so be that you are right in your answer, can we not learn how to make up, in part, the present scarcity of wax by giving some wax-producing feed? I am not sure that one kind of sweetening has such influence; but if so, there are "millions in it" to the bee-raisers.

Have you any positive experience on the subject? If so, let us know the relative value of the different grades of sugar, etc.

A. L. KLAR.

Pana, Ill., Jan. 22, 1883.

To be sure, there are "millions in it," friend Klar. Old, old veterans in the "biz," like you and I, can see it, if the rest don't. And that reminds me that friend Olm, who

is now here making fdn. mills for us, tells that there is a man in Fond du Lac, Wis., who keeps bees to raise wax, and nothing else. As fast as they get a lot of comb in their hives he pulls it out and makes the little "insex" build more, and so on *ad infinitum*, or until the honey stops. I don't know what he does when winter comes. Well, I have several times, in feeding bees, had them secrete wax at an astonishing rate, yet I didn't know enough about it, and don't now, to tell whether it was food, or something else. Friend Viallon demonstrated several years ago, and has recently verified it again, that common brown sugar produces much more wax than white or granulated. By the way, friend K., I don't believe we can make very much at it by buying sugar, if it is true that it takes from 15 to 20 lbs. of sugar to make 1 lb. of wax; and come to think of it, as honey is worth twice as much, I don't see how we can get it by feeding honey either; but we must have the wax somehow, and, in fact, we've "got to have it," as the boy said. Some time I will tell you about the boy, if you never heard of him.

### THE NEW FOUNDATION-MILLS.

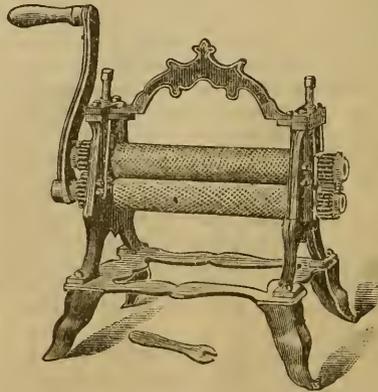

MADE FOR THE FIRST TIME IN OUR OWN FACTORY.

**F**RIEND OLM came with his machinery about the first of the year. His plan of making fdn. mills is quite a little different from the one pursued by Mr. Washburn. Instead of driving the metal into shape with proper punches, our sturdy German friend conceived the idea of a machine that would cut the metal out of each cell, one by one. He made it work, and the machine is now in operation day by day in our building. It is a sort of automatic machine, and a tool much like an engraver's graver goes down into the metal of which the roll is made, and makes a cut. After it has passed out of the way, another similar one goes down at just the right angle, and just far enough to take out the chip made by the first. The same machine moves the roller along just the right distance for the next cell, and so on until the roll needs turning for another cell. The metal used on all our former mills was something similar to tinner's solder, being largely composed of lead. These mills are made of a composition of copper, tin, and zinc, similar to hard Babbitt metal, and contain no lead at all. The metal is so hard it would not bear raising the cells, as our old mills were made. It is a little interesting to note how two ingenious inventors like Mr. Washburn and Mr. Olm each worked out the problem, independently of the other, of making honeycomb in metal rollers.

While we use Olm's engines for cutting out the metal, we have adopted the machines we bought of Mr. Washburn, for stamping the walls. I wish to state here, before leaving the subject of roll-making that our rollers made of this hard Babbitt metal are not as handsome as the mills we have previously sent out made of the softer metal; neither is the fdn. made on them as smooth and

pleasing to the eye, but it is better worked out by the bees, and comes from the rolls in a way the old kind never did. If you want handsome fdn., you will be disappointed; but if you want it for business, either brood-comb or starters, you will surely be pleased. I lay much stress on this because some of our English friends have complained pretty bitterly because the new mills did not make as *handsome* work as the old.

Another thing: We have entirely dispensed with the back-gear, because we found by experiment that even our girls could turn the rolls of the new mills with ease, with the crank right on the end of one of the rollers; and as they get along with the work very much faster, the back-gears are a great hindrance. This refers to mills for 10-inch sheets and under; for 12 or 14 inch, back-gear might be desirable. To get additional power, we make the crank pretty long for the 10-inch mill, a cut of which we give you below.

OUR TWENTY-FIVE DOLLAR TEN-INCH MACHINE.

With every mill we send a good sample of fdn. made on it; and with a very little practice you should be able to do as well. At the very low prices we make these mills, we can not undertake to alter or change the cells or walls to suit everybody's idea; or, if you will excuse me, everybody's notions of how they should be. I have satisfied myself by experiment, of what I think best, and our machines are running so busily on these that it will be a very great expense to change or make them different. We always furnish samples of the make of our rolls free; but before you judge of them, or, in fact, before you criticise our mills, I would ask you to hang a bit of the fdn. in a cluster of wax-working bees, and see how readily they take to it. Any of the mills, large or small, will make both brood and starter fdn. The small mills will, if any thing, make the thinnest. Any mill that does not suit may be returned, you paying charges. I would by all means get a 10-inch mill, for making fdn. for L. frames; although the 9-inch mills will do, it takes much more time, and more skillful hands to keep the sheets from running out of the rolls. While at the Cincinnati convention I saw friend Vandervort use a board with strips on the side, to guide the sheets squarely into the rolls. This board

was perhaps two feet long, and just wide enough to let the dipped sheets slide down between the strips on its sides. We are now using sheeting-boards, of seasoned maple. They do not rough up as much as basswood or whitewood, with frequent use.

Every mill improves with use. Running the rolls together tends to wear them so as to fit more perfectly; and after months of use, the metal points get polished where they work against each other, and the fdn. comes out very much easier than at first. On first trying a new mill I would take only a sheet of wax, say one by two inches, and then if this comes out without tearing, take a larger piece, and so on. Do not try to make very thin at first; but after you get used to it, screw the rolls down gradually, and you will soon be able to make strips wide enough for sections, as thin as ten or twelve feet to the pound.

### HONEY-HOUSE ITEMS.

ALSO A FEW OTHER SUGGESTIONS FROM FRIEND GATES.

**I** WISH to give a few items in relation to a honey-house as I have to have it, and perhaps as the most of our readers have; viz., to utilize some building already built.

#### A MOVABLE COMB-CLOSET.

I build my comb-closets movable, as follows: Take two planks, as wide as can be procured (mine are 18 in.); have strips 1x3 nailed to them, commencing 1 in. below the top, and put them one inch further apart than the depth of the frame. Have the top and bottom the same width as sides, nailed between them. Let the back be nailed to top and bottom. Now, the sides are as far apart as the length of two top-bars and *one inch*. A strip 6 inches wide in front, half way between the sides, holds the center-strips for the ends of frames to rest on. Doors are hinged to this center-strip. Height of closet as much as can be conveniently reached. Mine holds over 200 combs, and can be made in a day.

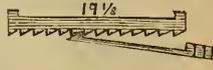

I have shutters to the windows of honey-house, and in the honey season I take out the sash and put a frame in place, which has another frame with wire cloth tacked to it, working inside on two pivots, so I can reverse sides to it in an instant, and put any bees that may be brought in, outside. I consider these, viz., the comb-closets and wire reversing window, essentials.

#### WORK-BOX AND SEAT COMBINED.

I don't think the seat shown in your price list has ever had half enough praise given. I could not get along at all without one, and I want the drawer by all means, to keep scissors, book of record, pencil, a queen-cage or two, etc. I only wonder how I got along without one so long as I did.

#### DRILLING TOP AND BOTTOM BARS FOR WIRED FRAMES.

I have also made a machine for boring the holes in the frames for wiring, that pleases me so well I wish to give you a description of it. I took an old Wilcox & Gibbs sewing-machine, and in place of the hook, or looper, put in a piece of steel umbrella-rod filed to a point, like a three-cornered saddler's needle, and 2½ inches long. This is the drill. Now, for the slide to lay on top of the table and hold the sticks: I made it

of a piece of plank 5 x 19, and 11-16 inch thick. The top-bar of a frame is nailed to one edge of this, projecting above, half its width, and another flat on top 2 inches from this; this holds 6 top-bars or 7 bottom-bars. Now we want a ratchet with notches 2¾ inches apart. It is ½ inch thick, 21 in. long, and 1¼ in. wide at the ends, and ¾ in the middle, like this.  It has a hickory spring to catch into it, and the slide is ready on top. The bottom has two grooves cut across it, 9 in. apart. ¾ x ¾ in., and two hard-wood strips the same size, 7 in. long, are nailed to the table for the slide to run on. This completes the whole. I made mine one night after supper, and bored fifty strips before bedtime. I can bore 100 frames in three hours, and do them accurately. It is just fun. A Grover & Baker sewing-machine treadle is the best. G. W. GATES.

Bartlett, Tenn., Jan. 8, 1883.

Many thanks, friend G. While I think I would make your comb-closet a fixture rather than to have it movable, I know by experience it is a very good idea to have a place for empty combs.—Your window-screen swinging on a pivot is an old idea, but it will do no harm to bring it to mind again.—Your bar-piercer, I am inclined to think, is a valuable idea, and our experience has always favored using a drill, rather than an awl that does not revolve. It is easier, does the work cleaner and nicer, with all kinds of wood, and it seems to me must be more rapid. Our machine is much the same, only we have drills enough for the whole bar at once. We have had much trouble in getting drills that would not break; after using expensive twist drills we tried knitting-needles, and finally wire nails flattened at the end, and these were less trouble, because they would bend before breaking. I am inclined to think your umbrella-wires will be just the thing.

## Humbugs & Swindles

### Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

**P**LEASE inform me if there is a patent on the "Golden" bee-hive, by a Mr. Pickle, of Nashville, Tenn. There is a gentleman of this place selling rights for the Golden in this and Montgomery Co. I purchased one of him, and it proved a total failure in the honey line.

LEWIS A. EASTERLY.

Sandy Ridge, Lowndes Co., Ala., Jan. 19, 1883.

If the hive proved a total failure, friend E., I hardly see why you should care whether there is a patent on it or not. Nowadays it is getting to be almost the rule, that about as good an indication one can have that a hive is worthless, is to know that it is patented. Our successful honey-producers never use patented hives. You will see, by looking at our back volumes, that the Golden bee-hive has been many times reported as a swindle.

**HONEY-HOUSES; AN IMPORTANT ITEM.**

SCREENS FOR WINDOWS, ETC.

**I** THINK that friend Doolittle's bees are not very smart, or they would find that space where the wire screen extends over the top of the windows of his honey-house. I think my bees would find it quicker than you could say seat; for proof, read the following: A few years ago I stored my honey in a roughly made storage room joined to my house. It was boarded up and down, and not very tight any way, and of course the bees soon found it out. Then I began battenning up cracks at the sides, around the sills, roof, and, in fact, everywhere, for 2 weeks or more; and not until they had carried several boxes of honey back to their hives did I beat them. Every day they would find some new place to get in, until finally they went around it to my kitchen door, through that, and across a kitchen of 12 ft., to the door of the honey-room. That door being tight they crawled under the casing, where it lapped over drop siding, and around the studding, and out under the casing again into the storeroom. It was not now and then a bee that did that, but large numbers. Beat that, if you can.

My present honey-house is 8x10 ft., and bee-tight; but when I first put honey in it they found a way in through the key-hole, about as soon as there was honey in there; and whenever honey is not plentiful in the fields, they are hunting every crack and joint from sill to roof-ridge; but have never made it a success, as it is plastered inside. To get those out that get carried in, I have the top sash of the windows hung on pivots, and a spring bolt at the top, so I can draw the bolt, tilt the sash, brush them out, and tilt sash back.

I will tell you next time how I keep my empty combs.

A. A. FRADENBURG.

Port Washington, O., Jan. 8, 1883.

Thank you for calling attention to this matter, friend F. When I read friend Doolittle's description of the way in which his window was fixed so all the bees inside could at any time get out, while none outside could get in, I fell to wondering whether it would work with such bees as we have sometimes. On further reflection I decided that, as friend D. is a very careful man, he probably does not have bees educated up to the pitch of pilfering, that we often do, and that the device will be very valuable help to all who keep things in any sort of decent order. I can readily understand, friend F., how the bees worked and "wiggled" (I think that is the right word, isn't it?) to get at the honey, for I have seen them. To take an old building and batten it up so bees can't get in, after they have been educated to it by several pounds of honey stolen during an interim of a week or ten days, is almost an impossibility. Why, it seems as if they would go through inch boards, when they get really into the merits of the case, and it is "a good day for robbing." Will those who test, or who have tested friend Doolittle's idea, please report? I presume it is well known that our English friends have a device called a bee-trap that lets bees pass one way, but not back again. It just now occurs to me that we did try having the wire cloth loosened at the lower end, on

one of the windows in our wax-room, and it answered very well by letting the bees outside as soon as they had buzzed themselves tired enough to fall through the opening.

**A LETTER FROM JERUSALEM.****Holy-Land Bees in their Native Home.**

ALSO A FULL ACCOUNT OF THE DEATH'S-HEAD, OR THE MOTH THAT "SQUEAKS."

**I** TAKE the liberty of addressing you these few lines, hoping not to annoy you by a little report concerning the death's-head moth. Being a subscriber to your journal by the intermedial of my friend and teacher in apiculture, Mr. F. Benton, living at Athens at the present, I saw in the November number of GLEANINGS, page 553, an article, "A Moth that Squeaks." Having previously made some acquaintance with that "moth that really squeaks," I thought of sitting down to-night and giving a little account of my own experience with them.

On the 26th of October, this year, preparing my hives for wintering at the "Gardens of Solomon's Apiary" (near Bethlehem), I took two dozen of these moths out of some such hives as had the entrance high enough to permit them to enter. In one of the hives I found seven such moths, all skeletons, for the bees had taken out every portable particle from them, stripped them of the thick hair growing over their bodies, and began thus propolizing them. In August, September, October, and November, I frequently met with them disturbing the bees, but only in the night. When I first saw them flying before the hives, I could not make out whether the bats were disturbing my colonies, and began chasing them. When I succeeded in capturing one, it began squeaking about as a mouse would, although not quite as loud; since then I watched them closely, and captured some also, by means of a butterfly-catcher. They eat only honey, sucking it from flowers; but when they find such hives as allow them to enter, they prefer to suck it out of the combs, taking a teaspoonful of honey at a time. The insect measures 5½ inches across the wings, and about 2½ inches from head to tail. I should very much like to send you a specimen; still, you could not "hear it squeak."

I possess 3 apiaries in Palestine, besides the Mt. Lebanon and Cyprus apiaries, in connection with Mr. F. Benton. Bees fly gaily, but have nothing to carry in, when perhaps their North American friends are snugly tucked in their underground winter lodgings.

PH. I. BALDENSPERGER.

Jerusalem, Dec. 14, 1882.

Friend B., there are three reasons why we feel glad to get your kind letter. We are proud to say we have, for once at least, had a letter from that famed old city of the Bible; we are glad, also, to hear from our friend Benton; and, last of all, to know all about that death's-head moth, so much has been said about, and to know that it really does "squeak," as well as eat honey. Many thanks for the very full facts you have given us. The name of Jerusalem has been made dear to us by our recent Sunday-school lessons.

## ADULTERATED COMB HONEY.

ALSO SOME REMARKS IN REGARD TO ADULTERATIONS IN GENERAL.

**I** NCLOSE here a slip cut from the editorial columns of the Cincinnati *Commercial Gazette* of Jan. 12, as follows:—

It used to be considered safe to use honey in the comb, but now nearly all this is manufactured. At first the pure honey was extracted from the comb and the bees were fed on glucose, from which the comb was rapidly refilled; but now artificial combs are produced, and bees being fed on glucose, so-called honey is turned out in comparatively large quantities, and bees at the same time are being demoralized.

What the editor says of the adulteration of other foods, we can leave to those engaged in the production of those particular articles; but what he says about honey, touches the honor and the interests of bee-keepers. Do you suppose the assertion, that "nearly all the comb honey is manufactured," can be shown to be a slander on the honey-producers?

For my own part, I have raised honey for market, and sold it, and could defy any chemist to find any thing in it but what the bees gathered in the fields; in fact, it was absolutely *pure honey*, and I have scarcely any doubt but that the honey sold by all the bee-keepers of our acquaintance is just as good, and the most of them would not know glucose if they should see it.

But if it be true, that there is adulterated honey on the market, it behooves the producers of good honey to expose and put a stop to such adulteration; for to just the extent that the belief extends, that honey is unsafe to eat, to that extent is the production of honey, and the bee business permanently damaged. Besides, the adulteration of honey would, in the long run, be unprofitable, even to the guilty party; because for every dollar that a dishonest person would make selling impure honey, a hundred dollars would be lost by the lack of demand for any honey, good or bad, caused by want of confidence that any of it was good.

It would be a tremendous pity to have the great and growing bee interest injured to the extent it would be by the general belief that all honey is spurious; there are so many people who depend largely on it for their living, and so many who make the production of honey an auxiliary to their other occupations, yielding them not only profit, but instruction and pleasure, that it would be an immense loss, pecuniarily and otherwise, to lose the market for their honey. And it would be no small deprivation to the lovers of good honey to deny themselves the pleasure of such good eating, for fear they should get something spurious.

I think few persons, outside of the bee-keeping fraternity, have any correct idea of the number of bees actually kept, and the amount of pure honey gathered in the country. It is probable that the mind of the editor who wrote the above article is associated with the old style of keeping bees, before movable frames were used; when the only way to get honey was to bore an auger-hole in the top-board of a box hive, and set a "cap" on it to be filled, or kill all the bees in the fall, and "take up" the honey. To such a person, the sight of the quantities of beautiful honey offered for sale only suggests, "manufactured from glucose;" "too much of

it to be pure honey." They have no knowledge of the improvements in the breeding and management of bees discovered in late years, which insure the large production of pure honey, and which elevate bee-keeping to the importance of a regular and profitable occupation.

And right here we can see the importance of the compilation and publication of statistics showing the number of hives kept, and the number of pounds of honey produced, so that our editors can have some knowledge of the quantity of good honey gathered by the bees, and need not jump at the conclusion that the honey is counterfeit because of the abundance.

Of course, it is perfectly right for newspaper men to warn people of food adulteration. The important thing is, that they shall state only that which is *true*. We are told that "the bees are being demoralized by feeding on glucose." Just how the demoralization takes place, the editor does not say. I am sorry he did not tell us; for if he had, I have no doubt we should have had something in bee literature quite entertaining, if not instructive. He probably means that the bees are injured in their moral character, perhaps made lazy and unprincipled by being fed on glucose, instead of being compelled to practice habits of industry by gathering pure honey in the fields, or perhaps rendered dyspeptic, and consequently unreliable, in their moods and tempers by having their stomachs full of such stuff as glucose.

Well, I expect to buy some queens and bees in the spring, and I want it distinctly understood by all queen-raisers, that I do not want any "demoralized" bees, none whose morals are damaged by eating glucose; only those of good habits wanted; only those will be received that can bring a certificate of character stating that they have not been fed on glucose.  
Cincinnati, Ohio, Jan. 11, 1883. THOS. HUNT.

The article you send us, friend H., will probably go the rounds, and many people will believe it; but I do not think those who give place to such items have any idea they are true. Editors, as a general rule, are well-informed men; but for some time past there has been quite a demand for sensational articles on the adulteration of food, and reporters as well as newspaper men, knowing this, are keeping the papers full of it. No doubt it is well to consider these things, and no doubt but that great harm has been done, and people should be awake to the matter; but the opposite extreme is in imagining that everybody is a cheat except yourself, and that your neighbors, right and left, are perpetrating frauds on each other every day. Within a few days one of our bee-men writes that some of his own honey was analyzed by some professor from some university, who styled it principally *glucose*. I do not believe the *liquid* honey in our market is, as a *rule*, adulterated, nor do I believe many well-established grocers will give you sugar or any thing else that is adulterated, when you ask for the pure article. Are bee-men the only men in the world who are honest? We are all of us more or less responsible for the folly that is going the rounds of the papers, and we ought to be ashamed of it. Adulteration will out, like murder; and the man who is proven guilty of such littleness is killed for ever in business, and in the estimation of all who know him.

## HALF-POUND SECTIONS, AND OTHER MATTERS.

FRIEND ROOMHOWER'S IDEAS ABOUT THEM.

**I** SEE half-pound sections quoted as high as 30 cts. per pound. Now, unless honey in half-pound sections brings more than 5 cts. per lb. in advance of that put up in 1 and 2 lb. sections, I doubt if any thing is gained by the change; but I fear much will be lost.

In our market here at Albany, I am informed, by reliable dealers, that they sell just as many 2-pound boxes of honey, and in some cases more, than they do one-pounds, set side by side; and I can not get one cent on a pound more for a pound section than I can for a two-pound; and if the 1-lb. box had never been brought to notice, I really think it would have been just as well. And, by the way, I have heard a good many hard words hurled at our friend Novice for bringing them into use; and if he had attended the convention at Albany, when the "box question" was discussed, I think he would have been lucky to get off without having his hair pulled.

### SEPARATORS.

I have often tried to get evenly built combs in my sections, without the use of separators; but to say that I have failed in every instance would hardly give the matter a true expression. Yes, I have more than failed, and I think that Mr. Heddon must exhibit some *hidden* power over his bees, to induce them to build combs evenly and where he wants them to. How many are there besides Mr. Heddon who use no separators, and have their combs nice and straight? When a colony of bees first commence to work in the surplus chamber, they generally begin in the center, or part that is located over the most thickly settled portion of the hive or brood-chamber, or in that part of the hive that contains the brood. First a few sections are taken up; and as they proceed from that portion first occupied, out toward the outer side, the cells taking the same position are elongated far beyond the center of the box or section, and the result is, a section with the weight of the honey all on one side. This is my experience, and I shall never try to produce comb honey in sections without separators.

### HOW TO KEEP GOOD FRIENDS WITH OUR NEIGHBORS.

Since I have been keeping bees I do not know that I have gained the ill will of a single man or woman in my neighborhood. Somehow my bees never seem to sting or bother any one; and if they do, I never hear any angry threats that my bees must be removed from the village. Located as I am within ten feet of the main street, it seems strange that I do not get into a fight with some of them. Well, I will tell you how I manage to keep good friends. If I hear of any one getting stung in the neighborhood, I send or carry them a nice section of honey; or if I have none in sections I send a few pounds of extracted, and the result is, instead of getting enemies I generally get orders for some honey; for when I offer to give them some nice honey, you see they will see how nice it is, and after I am gone they will say, "Well, there! isn't he clever?" and, "Oh how nice this tastes! I guess you shall have to buy some." And the way it generally turns out, I get a customer and a good friend at the same time.

Last spring while in the store one evening I overheard an old man telling another gentleman that we should have no more fruit, because there were so

many bees that they would eat the fruit-blossoms all up. Why, he said that the bees were so thick on his apple-trees that they dug the bloom all off trying to get to the honey, and that all of the bee-keepers ought to be prosecuted, and that he wished he had all of the bees in the country under a straw-stack. He would touch a match to it and burn up the whole business. A short time afterward I gave him a small pail of honey, and explained to him that bees did not harm the blossoms in the least, but, on the contrary, did them good. Well, he said that it was the first that he ever knew that bees did the blossoms good. He supposed that they sucked away all the juice which made the fruit. But I am sure he believes me now, for we have had an immense crop of fruit this last autumn. So, my friends, if your neighbors get angry at you because your bees sting them, send them some nice honey, and it will heal the wounds.

F. BOOMHOWER.

Gallupville, Scho. Co., N. Y., Jan., 1883.

Friend B., we succeed in bee-keeping, or any other kind of business, when we work for the good of the people at large; and I believe the masses have decided, pretty unanimously, that they want a small package of honey at a time. Notwithstanding what your Albany bee-folks said or thought about my poor self, the demand for 1-lb. sections the world over has been almost the wonder of the world. We made and sold about one million ourselves last year, while all the other sizes amounted to scarcely one-tenth of that number.—I admire your way of letting your neighbors see what good honey is like, and of disarming prejudice, and I am sure it pays best in the long run.

## WIDE FRAMES, OR CASES, TO HOLD OUR SECTIONS.

### WHAT SHALL WE USE?

**W**E are a progressive people. To-day one thing is all the rage, and to-morrow it is dropped for something new. We get all fixed up with surplus arrangements one season, and by the next season some one's ingenuity has made some great improvement, and so all our fixings must be laid aside for now, if we wish to keep abreast with the times.

A few years ago you gave us the one-pound section and the broad frames. It seemed as though this was nearly perfection—good enough. It seemed one pound was about the right thing; but now, just as it is becoming a standard section, somebody thinks we want a smaller one. Now, I do not believe there is any call for a smaller section than the one-pound; but if we must have a smaller one, I say let us have it so it will fit into our regular broad frames.

Then there is the combined case you got up. It is a regular stumbling-block for beginners. They do not know which they want, the case system or the broad frames. I must confess, myself, I like the form of giving the bees 23 sections, one deep, covering the top of hive better than to give them twenty-eight in wide frames two deep, covering half the hive; but it seems to me the advantages in favor of the wide frames are two to one—first, not being any space between the two sets of sections; second, 8 sections can be handled at once instead of one; thirdly, by the use of the division-board the surplus room can be contracted, even to

one frame of sections (a great advantage in the last part of the season, as the sections can be all crowded out or filled, and not have a lot of partly filled sections, as with the combined case). The idea of sending the case to market just as it comes off the hive is not a good one, as any one will find out; if he thinks any thing of his reputation as a honey-producer, the sections should all be handled over and graded before shipping.

Now, friend Root, this brings me to the question I wish you to ask friend Heddon. Many times, in speaking of the wide frames, he says, "If you use wide frames (I would not)." Now, we have perfect confidence in friend Heddon's ability as a honey-producer and as a teacher, and have no doubt he can explain satisfactorily why a case is better than the frames; but never having seen that explained, we wish to call on him to explain it; also let us know if he has had practical experience with the broad frames.

JAMES B. MASON.

Mechanics Falls, Me., Jan. 14, 1883.

The respective merits of wide frames, or a case of sections on top of the frames, I have considered at length in former articles, and I do not know how any one can tell a beginner, or any one else, which plan will be best for him under all circumstances, friend M., especially when people have such different ideas of things in regard to which is best. Your ideas in regard to grading the honey are very good, and are a strong argument in favor of wide frames and separators.

### IS BEE-KEEPING TOO HARD WORK FOR WOMEN?

BY ONE WHO HAS TRIED IT ELEVEN SUMMERS.

**T**HE question will soon be answered in a practical and general way, since, from Maine to Texas, women are turning their attention to the pursuit in a yearly increasing ratio. That women should keep bees may, in due time, become almost as much a matter of course as that, in Germany, they should engage in field work.

"The American women, they is too lazy, and they is too proud," said a German woman, after telling me of the work to which she had been accustomed in the "old country." That such work was "too hard," or in any way undesirable for the American woman, seemed beyond her comprehension. And that bee-keeping can be "too hard," seems equally beyond the comprehension of certain of our sisters who not only enjoy their work, but find their strength sufficient thereunto. They compare it favorably,—as, indeed, I have often done myself,—with certain kinds of housework, from which there is, for some women, no escape.

That a day at the wash-board is harder than a day in the bee-yard, is true. And some of us who could hardly earn the salt for our porridge at washing, can at least provide for it the *sweetening* at bee-keeping. But it does not follow that the average wash-woman would do even this much. I know of one whom I would not trust with the care of one colony—to whom I could not conscientiously sell one. But she does her washing with ease, and—if *carefully watched*—she does it well. Bee-keeping would be for her too hard a study.

I have in mind, also, certain teachers and seamstresses who are supporting themselves by their work. They have the brains which my washwoman

lacks, but they have not a tithe of her physical strength. They might do *something* at bee-keeping,—the care of one or two colonies might do them good in many ways,—but they could not depend upon it as a *means of support*. It would be folly in the extreme for them to relinquish the work they understand, with the hope of providing themselves shelter, food, and clothing, by keeping bees.

And there are farmers' wives sadly in need of spending-money, and looking toward bee-keeping as a possible help, who are so weighed down with other cares that they should pause and consider well how these may be lightened before they venture to add thereto the care of bees; "For is not the life more than meat, and the body than raiment?"

Whatever a woman's fitness in other respects, she should have the additional advantage of a home. Such a one, with comparatively little risk, can satisfy herself by experiment whether or not the work, if engaged in somewhat extensively, is likely to prove "too hard." It is, in my opinion, the best and only way to settle the question. Still, a little friendly discussion respecting it, among the sisters, with an interchange of opinions and experience, may be of some advantage. It can not fail to be so, if it should bring to light the improved methods which enable one to perform with ease what another finds "too hard."

For instance, for the benefit of the sister who, on page 438 of last volume, indicates one of her difficulties, will not Mrs. Harrison tell us just how she manages to avoid moving heavy hives, in swarming-time? If she uses the Brooks swarm-catcher, will she kindly tell us how she managed previously to its introduction—which was only during the past season?

I am somewhat ashamed to confess, that the swarm-catcher was not tried in our apiary last summer, though there was abundant need of it, and we fully intended—but, no matter about that.

Our practice is to move the old hive back, setting the new one in its place. If there be time, the deserted sections in the cap are first taken off; but if not, as is often the case, the old hive is *shoved* back—not *lifted*. If there be but one to move it, it is twisted around and off the stand, in the easiest fashion possible. When the swarm has returned it is carried to a new stand, and the old hive is shoved back into place. Sister and I usually work together, but we can manage in this way alone when the swarms do not come too thick and fast. But it is hard work.

Nor do I hesitate to confess, that our bee-keeping the past season has been quite "too hard work." Perhaps I should say, rather, that we had, combined, too much bee-keeping (51 colonies in the spring, 75 now), and too much housekeeping for our strength.

We happen to live in a place where reliable help in the house is hard to obtain, while help in the bee-yard is out of the question. We supposed we had provided in-door help for the season; but at a critical time, during haying, and some little time before the basswood harvest, we were left alone, nor could we obtain any help which was better than none, for the rest of the season.

The most important results of our summer's work may be briefly stated. We have determined to sell, or give away, every one of our 75 colonies next spring. I have pleaded vainly with Nellie to be allowed to keep one, promising to select the weakest there may be. But she is inexorable.

After eleven summers among the bees, we are to try to live without them. We are to have time to see our friends, to make the new house somewhat more homelike and cosy, etc. And when I venture to inquire, "But, how shall we do without the— the spending money?" she answers, "Cyula, another such season as last summer, and we shall for ever more have no need of spending-money!"

She is not very logical; but if she be of the same mind next spring, she shall have her way.

Jan. 15, 1883.

CYULA LINSWIK.

Many thanks, my good friend Cyula, for your kind letter, that savors of fairness all the way through, and that treats this matter in so wise a way to; but I want too make a little protest to my friend Nellie, inexorable though she may be, as a general thing. It is about this same "spending-money" you touch upon, too, at the end of your letter. You say during haying, etc., it was that you found so much trouble. Now, why not sell off the "haying" instead of the bees? Did the hay, all together, bring as much money as the bees? Of course, I know nothing of the circumstances, but I can illustrate my meaning by telling a story I have several times told before. One year, when our honey crop sold for over a thousand dollars, an old bee-friend who lived near, and had as many bees as I, or more, stopped extracting when it came haying and harvest time, because he couldn't leave his grain to spoil. The entire crops of his small farm would not bring \$300.00 (and it was a comparatively easy matter to hire men to do that work, too) and yet he let surely over \$500 worth of honey slip through his fingers, and did it with an easy conscience too. Have I got off the subject of bee-keeping for women? I think not. If you and our good friend Nellie would keep bees, and not be worried with any other cares, I am inclined to think you would enjoy it more than any thing else in the world; and, also, that it would give you a better income than doing any thing else. Well, if that is so I appeal to the folks who do the "haying" at your house, to take immediate steps toward some arrangement that will let you two follow your own taste whereunto you are called of God, and then, perhaps, you may write us something a little more cheering on the subject of bee-keeping for women, after the season of 1883 has passed. By the way, friend Cyula, you didn't tell us how much "spending-money" the 75 produced.

### MY NUCLEUS HIVE.

A HALF-LENGTH LANGSTROTH FRAME.

66 **C**OME, be short."  
"Yes, yes."

Sides 10 $\frac{1}{2}$  in. long by 9 $\frac{3}{4}$  wide by  $\frac{1}{2}$  thick; ends, 6 $\frac{1}{2}$  in. long by 9 $\frac{3}{4}$  wide by  $\frac{3}{8}$  thick; bottom, 13 in. long by 7 $\frac{1}{2}$  wide by  $\frac{1}{4}$  thick; cover 10 $\frac{1}{2}$  by 7 $\frac{1}{2}$  by  $\frac{1}{2}$ . Two cleats on sides for handles; one cleat on front end of bottom, to keep from warping; two cleats on top of cover, to keep that straight. Front end,  $\frac{1}{2}$  narrower than the above "9 $\frac{3}{4}$ ," making it 9 $\frac{1}{2}$  for entrance. Paint, two coats, and use shade-board.

FRAMES.

Ends, 8 in. long by  $\frac{3}{8}$  wide by  $\frac{3}{8}$  in. thick; top and

bottom bars, 8 $\frac{1}{4}$  in. by  $\frac{3}{8}$  by 3-16. Extra outer top-bar, 9 $\frac{1}{2}$  in. by  $\frac{3}{8}$  by  $\frac{3}{8}$ .

HOW TO FILL THEM.

The regular top and bottom bars have 4 holes, for wiring with No. 30 tinned wire. These holes are 2 in. apart, and the two outside ones are about  $\frac{3}{8}$  in. from the side-bar. Wire four of these frames, and fill them with comb fdn. by the button-hook hand-pressing process. Now, two of them will just fill a standard L. frame (the extra top-bar is not on yet). Insert two of these filled L. frames in the center of a good strong colony. Within 24 to 48 hours the fdn. will be new comb, and full of eggs. You can now remove them, or leave them till the eggs are hatched, or till the young bees begin to emerge, and then you can remove them (with adhering bees), or get bees from some other hive, or from a natural swarm, or any way you choose, and use any of the many simple effectual methods to newly locate the bees (but this article is not on queen-rearing, but nucleus hives), and nail on your top-bars, properly placed, with one 3d fine nail in each end, left out about 3-16, so that when you wish to unite nuclei for wintering, all you have to do is to pull off these outside top-bars, and slip the little frames into half the number of L. frames; then put them in full-sized hives, and you know the rest. When spring comes, if all are alive you are ready early to fill more nucleus hives. If part are dead, the same is true by using half brooded and half empty combs. If all should be dead (and there will not be any sense in such a state of affairs five years hence, or less, for we are going to get control of this wintering business soon), all you have to do is to repeat the process of last season, when you began with the fdn. I have used 8 small frames, 2 larger ones, 2 full L. frames, in both narrow and full-sized hives, and hives divided into 2 and 4 parts, for queen-rearing; but the little hive described above "gets away" with them all. Nothing so nice to ship a choice queen in. On arrival, the queen, combs, and brood can all be utilized at once, if the purchaser is fortunate enough to have the standard frame. The empty nucleus hive can be laid aside till the owner wishes to rear a few queens. I have used 30 of them, and have now under construction 175 more, 125 for my own use.

Well, well; I have got only six pages, not enough for a 3-cent stamp. Just let me pull the stopper from my "bottle of all sorts."

HALF-POUND SECTIONS.

Just a minute. GLEANINGS is quite quiet on the  $\frac{1}{2}$ -lb.-section business. Mr. Osborne and you have a few words to say, on page 10. "I kick" on both of you. Mr. O. has too thin a section, especially if separators are to be used. He seems to make no allowance for separators, while the section *should* be one-fourth wider with than without them. He is not far out of the way of  $\frac{1}{2}$  lb., I think, however. Why, you have accommodated the old broad frames nicely, but yours is about a  $\frac{3}{8}$ -lb. section. I call you to order, sir. The subject is " $\frac{1}{2}$ -lb. sections." We see an advantage in thinner combs.

Now, that queen-excluding honey-board. Are we going back to the time of Huber? Please excuse me; but I must say, that I really think that, whoever thinks he needs a queen-excluder, needs only more light regarding the best methods of obtaining the most comb honey in the most marketable shape.

Now, I have formed my private opinion of Mr. W. E. Flower, of Ashbourne, Pa., though I don't remember knowing that such a man lived till I saw his ar-

ticle, "Blacks v. Italians," on page 13; and, publicly expressed, it is, that he is honest and fearless in expressing his convictions; that he keeps bees for profit; that he is going to "get there;" that we shall hear from him again; that he will soon be in accord with just what you state on p. 21; that there are indications that a dash of black blood improves the Italians, especially for comb honey.

Dowagiac, Mich., Jan. 11, 1883. JAMES HEDDON.

Well, friend H., you have got neighbor Harrington's idea for nucleus hives, exactly. He has had them in use two seasons, and I believe likes them pretty well, although he has not as yet got round to pulling off the top-bars, and hanging them two in an L. frame. The little frames seem to work right; but still there is an inconvenience in not being able to exchange a single comb in these little hives with any comb in any of the larger hives at any time. When stocking them with bees and brood he just cut the brood out of a large frame, divided it in the middle, and it just filled two small ones. His plan to keep them from starving was to keep granulated sugar all the time on the bottom-boards. These half-sized frames have been advocated and tried a great many times, but no one keeps them more than two or three years, so far as I have been able to determine. I confess I like the idea; but then, again, I don't like the idea of more than one regular frame in any apiary, and, I can almost say, or anywhere else.

### CAN WE AFFORD TO USE THE HALF-POUND SECTIONS?

WHAT WILL IT COST US TO DO IT?

MUCH is being said of late relative to our using the ½-lb. sections, what the size shall be, whether they can be used without separators, etc.; but I have failed to see much, if any thing, said regarding their profitableness to the producer. Much is said about our catering to the wants of the consumer, and about the demand regulating the supply, etc.; but I wish to say, right here, that the consumer would never have demanded a ½-pound section had not the producer placed such before him. It is this strife, regardless of cost, going on among our bee-men, to see which can put something upon the markets a little different from what his neighbor uses, that has caused ½-pound sections to be quoted in our markets, and not the demand of the consumer. The same thing can be truthfully said of all the different styles of packages since the Rev. L. L. Langstroth gave us the 6-lb. box. The demand for a smaller box containing but a single comb of honey would doubtless have sprung up in due time; but the sequel shows it was the ever-restless disposition of those keeping bees that preceded the demand, and thus educated the consumer, or caused him to call for a smaller box. Thus, a few of our bee-keepers have sent sections holding about ½ lb. of honey to Crocker & Blake, of Boston, and the result is, quotations from them which have nearly upset the bee-keeping world, and set them crazy over the subject, without a single demand from the consumer upon them.

I said, a little while ago, that these things were

gone into regardless of cost, and the object of this article is to show those, not entirely bereft of reason on this point, what it will cost us to produce a pound of honey in these ½-lb. sections. As our bees could work in the 2-lb. box or section to just as good advantage as in a larger 6-lb. box, I will take that as a standard. As this section sells in market (as quoted by D. W. Quinby, of New York) at 23 cents (his lowest quotation), I will take that as the standard as to price. After careful experiments and a large correspondence, besides talking with many of our most practical bee-keepers, I have come to the conclusion that, by the use of the 1-lb. section in preference to the 2-lb., we sacrifice ⅓ of our crop of honey on account of cutting the cluster of bees up so much, making a disadvantage to them which amounts to ⅓ of our crop. Then we have twice the number of sections to buy or manufacture, and put together, and twice the number of pieces of foundation to prepare, saying nothing of the larger amount to use. Then comes the extra amount of handling, from the time they are ready to put upon the hives till they are ready for market. Without going into further detail I will say that, after careful figuring, I have decided that the loss we sustain by using the 1-lb. section instead of the 2-lb., amounts to at least 1-6 of our crop, which, taking 23 cents as our standard, would be nearly 4 cents. Hence, it will be readily seen that the 1-lb. section should sell at 27 cents, to warrant us in using that style of section.

There are many points of minor importance which could be urged on both sides of the question; but after summing them all up they would not materially change the above conclusion. When the 1-lb. box or section first came into notice I looked over all these points, and find minuted down in my diary these words: "When the 1-lb. sections sell at 25 cts. per lb., I can make the same profit from my bees by raising honey in 2-lb. sections and selling the same at 20 cts., that I could to adopt the 1-lb. When the 1-lb. sell at 20 cts., I can do as well by selling the 2-lb. at 16 cts.; and if the 1-lb. sell at 15 cts., I will hold to the 2-lb. section, if I can get 12 cts. If a greater difference in price exists, I will change sections; but not before." Hence, to-day finds me still in favor of the 2-lb. section, as the difference in price is, as a rule, not over 2 cents per lb. in favor of the 1-lb. section.

Now, if we adopt the same line of reasoning to arrive at the truth regarding the ½-lb. section, we shall find that, by its use, we shall lose nearly one-half of our crop. At the North Eastern Convention recently held in Syracuse, Mr. F. C. Benedict and Mr. Newman, of Wyoming Co., N. Y. (the parties who have furnished Crocker & Blake most of their honey in ½-lb. sections), when asked, said that they thought they could get only about ⅓ as much honey in the ½-lb. section as in the 1-lb., and that they used it only in the greatest flow of honey, as the bees would not work in them to any advantage when honey was coming in moderately. Now, if we add to this the extra cost for sections, and the time necessary to handle them, from the time they are taken in the flat till they are ready to go to market, we shall see that the placing of the loss at ⅓ is not far out of the way. Then if we apply this to our standard, we shall see that ½-lb. sections of honey should sell at 46 cts. per lb., to warrant our going into them. As there is no prospect of our getting this, why discuss the best size, etc., instead of

discussing the subject as regards its paying qualities?

Again: One of our most practical apiarists, who had watched the honey market for years, told us at the convention that if we all placed our honey on the market in ½-lb. sections in the fall of 1883, it would not bring a cent a pound more than if all placed their honey on the market in 1-lb. boxes, and I believe he was not far from the truth.

I have thus written my views regarding the small sections, hoping that, by so doing, I might persuade our brethren not to go into this thing "in haste, to repent at their leisure." As the ½-lb. sections sell in market at the same price as the 1-lb., and suit my surplus arrangements just as well, I shall continue to use those in connection with the 2-lb. section, thus attesting my faith by adhering to the thing which gives me the greater profit.

G. M. DOOLITTLE.

Borodino, N. Y., Jan. 16, 1883.

I am inclined to think, friend D., that your views are a little extreme in the matter, although it may be as bad as you say. Granting it is, if our friends still insist on little packages, we shall be driven to take up the old question of some means by which we can cut comb honey up into little squares, and not have it "leak." At the Michigan convention I suggested that a large sum of money could easily be raised for the man who would show us how to cut up our honey, after we had got it in full-sized frames. I suppose it is well known, that the bees will make beautiful honey, and at a great rate, in nice new ordinary brood-frames, with the help of fdn. Can it be done?

### A GRATEFUL A B C SCHOLAR.

ANOTHER PLEASANT LETTER FROM OUR FRIEND ROESE.

SEEING no report from our Badger State, I shall take great pleasure in informing you of my prosperity with my bees during the past year. I am an old bee-keeper; kept them without profit for 10 or 12 years, and yet I am just in the A B C class. I used to keep them in home-made box hives. In the winter they would die, and in the summer they would fly away. Six years ago I lost them all. Five years ago I took one swarm in box hive on a debt, and commenced the old box-hive way again; and only two years ago I got knowledge through *Farm and Fireside* of GLEANINGS. Since reading this journal, my interest in the new way of bee-keeping became awakened, and I adopted, gradually, the Langstroth and Simplicity hives.

In the fall of 1881 I went into winter quarters with 45 colonies, and wintered safely 35, which number increased by natural swarming the past summer to 86 swarms. I sent for a Novice extractor and other implements and supplies rather in the rush of business, and the result was, that every thing went wrong with me; my goods were miscarried by the carelessness of railroad officials, and I lost the best of my honey-flow. On receiving my extractor, July 23, I went to work with all my might. I extracted from such colonies as were in movable-comb hives, and transferred other swarms from candy and cheese boxes and nail-casks, into new Simplicity hives, and succeeded in gathering a honey harvest

amounting to 1200 lbs. of honey—about 500 extracted and 700 in combs; and I should judge, from the free use of honey in the family, of which I have not kept account, about 200 lbs. were thus consumed.

My extracted honey I marketed in Mason fruit-jars. Price charged for quart, 55 cents, and ½ gallon, \$1.00; sold all at the rate of 15 cents per lb. My comb honey was in bad shape, a large portion in large wide frames for holding section boxes, for I did not get my Simplicity sections in time; and when I did get them I could not fold them without breaking. I was obliged to let the bees work in wide frames, and fill whole upper story; consequently I had to sell it all at 15 cents per lb.

On summing up all income for bees and honey during the past season, I have realized the sum of \$244.20. On deducting from this amount \$71.30 expended for hives, implements, fruit-jars, tin pails, and supplies of various kinds, I have a profit of \$162.90 left, which profit paid a mortgage on our homestead, which hung over our heads for 7 years past. The principal was \$150, and interest, 10% per annum. This my bees paid, within \$2.90, both principal and interest, and blacks at that.

Friend Root, if you had seen the bright eyes of my "better half," and the cheerful countenance of the juvenile "Badgers," you would have joined in with us in a hearty laugh and pleasant smile on seeing me carry the gold and silver in a little tin pail to our next-door lady friend, who held the mortgage. You "bet" we slept soundly that next night; and little Minnie, your Maiden's Rock story-teller in Sept. JUVENILE, said, "Father, as you have that mortgage paid, you will save \$15.00 interest next year; can't you afford to buy me button shoes next summer?" I answered with a hearty "Yes." Don't you think so too?

Now, my good friend Root, I owe all this prosperity in bee-keeping, while in the A B C class, to your good instruction through GLEANINGS and the A B C book. My bees have paid nearly all my little debts. We all think and talk about Mr. Root as we would a dear friend, and you have our best wishes, both of little and big in the family, and we should feel lost without GLEANINGS. Please don't forget to send Nov. and Dec. numbers. If I don't get them there will be a link missing in the connecting chain. I am greatly encouraged in bee-keeping, and will gladly give you credit for instructing me, and God the glory for his blessing. I feel better than I did when thieves stole my bees and honey last October.

TITHING.

I went into winter quarters with 76 swarms of bees, mostly all in good condition, packed in chaff. It seems to me that the Lord, the origin and fountain of all blessings, ought to have a share in them. Don't you think so? I have an impression, that the tithing system is binding on all mankind throughout all ages and generations. If so, the Lord would own 7 colonies in my apiary. What do you think?

STEPHEN ROESE.

Maiden Rock, Wis., Jan. 6, 1883.

I am very glad indeed to see you are so grateful, friend R., and I rejoice, too, to see it take the shape of gratitude to God. I, too, have paid off mortgages before now, and I think I can fully sympathize with you about the time when you had the "honey money" in that tin pail. There are few things in this world I enjoy more than paying honest debts, especially after I have been working hard,

and praying too, for the money it required. About paying tithes: While I entirely agree with you, that something is due to God from every one, I am not yet sure it is the best way to set apart a hive of bees, or several hives. In many cases it would make extra expense and trouble to keep the yield from them separate; and then, too, these special hives might yield nothing in the hands of some, or during a bad season. Would it not look a little like bargaining with God, that, if he would give you so much you would give him so much? There are some who promise to give the Lord a tenth of all they make during the year, and this may be a very good way, if one doesn't get to making even that a sort of bargain, and then accuse God of not having prospered him, when it was all owing to his own improvidence that he did not succeed. I would rather put it this way: We all owe God the Father a debt, and I would strive to pay this debt (remember, it may be only the widow's mite) first and foremost; and I would make it a point to give God something every year, any way. Now, besides this, if he has prospered you, and you have made a clear gain of some money during the year, by all means give at least a tenth of it to the spread of the gospel.

---

### HALF-POUND SECTIONS.

#### WILL THEY PAY?

**O**N page 17, Jan. No., C. C. Miller says he doesn't know but he can get as much honey in 1-lb. sections as in 2-lb., but he has never tried the latter; but he thinks he could get more in the 2-lb. sections. Now, I am in just that same fix: I don't know either. I use the 2-lb. sections, and have never used the 1-lb. box. I am of the opinion, that bees will store honey faster in 2-lb. boxes than they will in smaller ones. Will some one who has tried both please stand up and tell Mr. Miller and me, and others who don't know, what the difference is? If all producers of honey should adopt the  $\frac{1}{2}$ -lb. box, which is now being talked of by some, who would be benefited by the change, the honey-producers, the supply-dealers, or the consumers of honey? I think the supply-dealers would be the ones who would be benefited. Why? Because, first, it would increase their business in cutting and furnishing sections, etc., as many more would be required to serve the same purpose that a less number would of the 2-lb. boxes. And, as has been already stated on p. 10, Jan. No., in reply to Mr. Osborne, the work on them will be nearly the same, and the amount of material will make but little difference; so, then, if the price per 1000 will be nearly the same for the  $\frac{1}{2}$ -lb. sections that it is for the one and two pound, then it will not be for the interest of the bee-keepers to adopt the  $\frac{1}{2}$ -lb. section. And, also, if you should make the  $\frac{1}{2}$ -lb. section as narrow as Mr. Osborne suggests, it would necessitate the use of more fdn., and for supply-dealers to furnish which, would add much to their profits, provided the supply of wax would hold out. You see, if you make your sections so narrow as to have combs worked as thin as natural comb, bee-keepers have got to use more fdn.; and it is more labor to handle more and put more in; and in view of a short supply of wax, and advancing prices

for comb, the  $\frac{1}{2}$ -lb. section will increase the cost of honey for the producer; and if our honey will not sell for as much more as it costs to produce it (and it will surely *not*), then it will not be beneficial for producers of honey to use the  $\frac{1}{2}$ -lb. box.

There is another reason why bee-keepers should not adopt the  $\frac{1}{2}$ -lb. box, as suggested. The bees have got to thin out more fdn., as more has to be used, and the bees have got to produce and use more wax, with an increase of labor, to seal over so many more thin combs; and lastly, the consumers of honey will not be benefited by eating the extra amount of indigestible wax that will be required in the make-up, and to inclose that  $\frac{1}{2}$ -lb. package of honey, for which it is said there is more demand than supply; and who has created this demand, the honey-producer or the supply-dealer?

G. J. FLANSBURG.

Bethlehem Center, N. Y., Jan., 1888.

While I agree with you in the main, friend F., and do not yet see how  $\frac{1}{2}$ -lb. sections can well be an advantage, yet I feel a little troubled to see the energy with which you and some of the rest of the brethren oppose it. It reminds me of the recent war on cheap queens. Then again, it strikes me there is an air of uncharitableness, not quite becoming us as a people. Our consuming brethren are good people, and disposed to do right, I think, and I also think the supply-dealers are not altogether selfish, if you will excuse the remark coming from one in my position. As a rule, we are all of us working for the best general good, are we not? The greatest objection I have to any more kinds of sections (or any thing else, in fact), is, that it multiplies and confuses, until one can hardly see the end of what we have got to keep in stock, and got to furnish.

---

### THAT HOUSE.

#### FRIEND MELLEEN OFFERS SOME SUGGESTIONS.

**T**HE great inquiry just now seems to be, What and how shall I build my honey-house, bee-house, etc.? Some years ago there was quite a fever on the subject, as many will recollect. Among others, I had it bad myself. Editor of GLEANINGS had it just like common men, only a little worse, if I remember aright. A good deal of ink was shed, pro and con, and discussions, more or less, in most of the bee-journals; but after a time the subject seemed to be dropped, as by mutual consent, and for some years but little interest has been manifested in the matter. I presume it has been with others as with myself—the fever, after all, never quite left me, and the chances of its breaking out anew with me, are imminent; I never felt quite satisfied to let the matter go by default, unsolved, where it was left. But now it looks as though it were coming to the front once more. It is a subject worth our consideration. At first in sitting down to write on the subject, one might not think it a difficult one; but it has as many paths, perhaps, as the frame question; hope it will come to as close a focus at the end.

We see, by the answer to calls from large apiarists for plans, estimates, etc., for such a house, that it is bringing out quite elaborate ones, as well as quite large and expensive estimates, which is all

well enough, perhaps, in its way; but I fancy these plans do not and will not meet the wants of the average bee-keeper. Now let us take a look at the lay of the land, and see what we can make of it:—

I take it for granted, that most of us have tools, and a shop of some kind where we can make our hives, and do all the plain work necessary to the bee business. Now, this shop, nine times out of ten, is handy in some out-building—generally in the barn. Yes, and with no extra expense—jus' so! So we have got provided for the shop. Now, the bee and honey house that we were looking for a long time ago not materializing, we got tired of waiting, and so, like a great many others, built a honey-house 10x16 feet, for the purpose of storing honey and keeping all the bee-fixtures, such as extractor, sections, quil's, mats, and other things too numerous to mention, placing it among the hives just "where it would do the most good." Yes, I think I hear a good many of you saying, "I did just that thing:" So we have our honey-house.

And now we come, lastly, to our bee-house, or, rather, *bee-houses*. We would build them for the bees—*bee-houses*—just large enough for *them*, and room enough for *us* to work in with comfort—small and inexpensive, and yet good—made something after the plan of Oliver Foster's, in May GLEANINGS, 1882. We think this plan of a bee-house a step in the right direction, at least for a large portion of bee-keepers, say those having 75 stocks or less.

In conclusion, let me say, we seem to need three rooms, for we have at least three departments necessary, or in the business, whether it be a large or a small apiary. And now the question comes, Shall they all be under one roof, or shall they be separate? I take mine separate. Next. R. H. MELLE.

Amboy, Ill., Jan. 10, 1883.

Seems to me, friend Mellen, you are still drifting toward the old house apiary, and I confess that I too have a strong leaning to it; but it has somehow always worked a great deal nicer theoretically than practically. I have tried a good many hands at it; but while I have no trouble in getting them to keep their hives nice and clean outside, it is almost always an untidy, sorry-looking place inside. I am a little afraid many of our nice honey-houses will also get to looking untidy after a little, if the good wife doesn't go in as a sort of "silent(?) partner" for the institution.

## THE MAMMOTH RUSSIAN SUNFLOWER.

### ALSO SOMETHING ABOUT SUNFLOWERS IN GENERAL.

**A**S sunflowers in many localities yield considerable honey, we have thought best to give the following, which a friend has sent us, clipped from the *Farming World*:—

There are forty varieties of the sunflower. Generally, the plant is not esteemed, but it has many valuable uses. It is cultivated in the south of Europe as a field crop. The Mammoth Russian sunflower is the largest, best, and most productive variety. I raised heads of it larger around than a half-bushel. They are, on the average, larger than a common water-pail. The seeds are very valuable for stock-feeding. Give horses a pint of seed in oats once a day; this will keep them fat. The leaves are valuable for cattle. The stems serve for fuel, and contain much potash. Sunflower seeds are the best egg-producing food known. They keep poul-

try in good condition, and largely increase the production of eggs. This plant should be grown by every poultry-breeder in the country, who has opportunity to raise only a few stalks, even for its properties in glossing the plumage of exhibition birds. For several years the seeds have been used in small quantities by breeders in fancy poultry as food for choice birds. They are mixed with other food, and the peculiar properties of the seed impart a beautiful gloss which no other grain gives to the plumage of adult birds. This plant grows very readily, and is a rank grower. It may be planted in any soil where other fruits and vegetables can not be conveniently raised—alongside of fences or wherever the soil is not easily cultivated. The flowers are double the dimensions of the South American varieties, and far exceed the latter as a bearer. A single head contains a larger quantity of seed. In south-western Russia, near the Black Sea, the sunflower is universally cultivated in field and garden, and every part is turned to practical account. A hundred pounds of the seed yield forty pounds of oil, and the pressed residue forms a wholesome food for cattle, as do also the leaves and stalks when green, cut up when small, all being eagerly eaten. The fresh flowers when in bloom contain a large quantity of honey, and so prove an attraction for the bees. Large plantations in swamp places are a protection against intermittent fever. It is recommended in medical works, as a preventive of malarial fever. The seed can be raised as cheaply as corn, having yielded at the rate of one hundred bushels per acre. The sunflower possesses anti-malarial properties of much value. Directions for planting: Plow and harrow as for other grain; mark out with marker, drop by hand, put in plenty of seed so you can have a good stand, for grubs cut it down sometimes. Plants should not stand closer than four feet each way. Plow and keep free from weeds, and you will have seed enough to fatten your poultry, and produce an abundance of eggs for market. The time to plant is from the tenth of May to the first of July. I raise a large patch of the Mammoth Russian sunflower every year for my chickens, and they never have the chicken cholera.

We have raised the Mammoth Russian pretty largely, and are inclined to think all that is said about it in the above paper may be true; but with us, the bees worked on it very sparingly. We have an abundance of nice seed, which we can furnish at 20 cts. per lb. By mail, 38 cts. per lb.

## VENTILATING THE HIVES FOR COMB HONEY.

### FRIEND SAMPLE'S EXPERIMENT.

**B**EE culture in this part of Iowa, it seems to me, is badly slighted, so many farmers take so little interest in their bees. They nearly all stick to the old-fashioned log gum, or box hive, with sticks across, and each comb built in as tight as though they were nailed, and a big cap on top that will hold 30 or 40 lbs. (young bees thrown in). Good honey brings good prices here. Fair comb, 20 cts.; extracted, 18.

I want, if I can make it plain enough to give to all to whom it may be of value, my method of obtaining comb honey, and more particularly the way in which I ventilate my hives in the hot sultry weather in summer, so that no bees cluster outside. I use the Simplicity ten-frame hive for the brood. I use a honey-rack, both sides glassed, holding 28 one-pound sections. Now, the way I ventilate is this: Having put the bees into brood-chamber, I put on top of the frames, at each end of the hive, just over the metal rabbets, a slat  $\frac{1}{4} \times \frac{3}{8} \times 16$  in., placing the slat which goes on the end that the entrance is cut into, up close against the end of hive; the other slat or slats, furthest from the entrance. I place

this other slat over the frames, leaving a crack  $\frac{1}{2}$  or  $\frac{3}{4}$  inch wide between slat and end of hive, the whole width of hive; over this crack I place a strip of common wire screen (used for doors and windows), so the edge of screen will fit tight up against the end of hive, and the other edge lap on the slat; then set the honey-rack on, and every thing is bee-tight, and there will be a constant draft of fresh air through the hive from the entrance to the opposite upper end all the time; and in this way I can regulate the amount of air by simply moving the slat out or under the honey-rack.

As proof of the value of this kind of method in hot weather, I had one hive ventilated as above described last summer, which gave me over 150 lbs. of honey, while right beside it sat one old-fashioned box hive, tight all around, in which the bees didn't make one pound of surplus, and clustered out all over the front of the hive. C. J. SAMPLE.

Mount Sterling, Ia., Dec. 29, 1882.

Our friend Adam Grimm once wrote quite strongly in favor of ventilating for comb honey, but I believe his plan was simply using hives without bottom-boards. With the Simplicity hive we get all that can ever be wanted, by simply moving the hive forward on the bottom-board, and I hardly think any simpler way will ever be devised for ventilating for any purpose whatever. With the chaff hive we have ventilators in each end of the cover, and a wide entrance always open. As the hive-walls protect it from the direct rays of the sun, I have always thought this ventilation enough. I know bees will at times be driven out of their hives by excessive heat, and this is surely a great loss when it occurs in the midst of the honey-flow.

## REPORT FROM MAINE.

### ALSO SOME HINTS IN REGARD TO WINTERING.

SEEING so many reports in GLEANINGS from all parts, and not one from this part of the State, I have decided to run the risk of your putting me in Blasted Hopes. Now, I charge you, friend Root, not to put me in the above-named department, for my hopes are not blasted.

I commenced in the spring of 1882 with 26 stocks, all strong the first of April, and our hopes were never brighter; but the weather came off cold, and our bees held their own in numbers only by our feeding, and not until the last part of June did our bees increase much. We had the most extended bloom of white clover I have ever seen here, but it contained no honey; and not until goldenrod blossomed, did we get any honey.

I increased from 26 to 73; sold \$300 in bees, and \$125 in queens, and have now 47 stocks left; not a pound of surplus did I get.

#### LANGSTROTH FRAME.

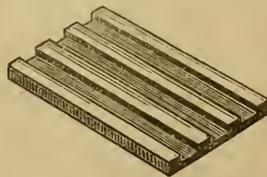

Down here in Maine our bee-keepers are crying out lustily for a standard frame, still holding on to the old-fogy notion that we must have a tall hive; and, what seems most strange, is that they should call for a tall hive, as though it were some new project, when, in fact, it is just what we have always had, and it has never given satisfaction, and it is the one great drawback in bee culture, this difference of opinion in regard to frames.

#### MAKING A TALL HIVE WITH THE L. FRAME.

Now, friend Root, I have an idea. I don't know but it has been advanced before; but if it has, I have not seen it. Can't you contrive some way whereby our friends who think they must have a tall hive can have one and still use the regular L. frame? Take your Simplicity two-story; set the frames on end, one end resting on the projection of frame on the bottom-board, with a piece put in crosswise of hive, on the bottom, for the other side of end to rest on; now put in division-board crosswise of the hives, reaching clear down through both stories; now make some arrangement to fasten the upper ends of frames, and they can put on a third story, and put in their chaff cushion, and have a hive all rigged for winter, and tall enough to suit any one, I should think, and still use the standard L. frame. JAMES B. MASON.

Mechanics Falls, Me., Dec. 27, 1882.

If you sold all those bees and queens, friend M., I should think you must have had at least some honey to do it with, unless you fed considerably.—The idea is old, of standing frames on end for winter, and I believe it was first given by Mr. Quinby. It has also been published in GLEANINGS, and the manner you mention, of putting them in a two-story Simplicity hive, so as not to need a chaff hive. Several friends have tried it, but I don't know now that I have had a report from them, after having tried it extensively. While writing, it occurs to me we now have a readier means of doing it than ever before. Let it be remembered, we now make our shipping nucleus hives for three frames, by nailing a very thin board on the sides of two of our regular spacing-boards, as shown below.

Of course, they are made so the three combs slide down into the proper grooves. For shipping, we cover both top and bottom with wire cloth, when the weather is warm. For wintering, we would let burlap take the place of wire cloth, perhaps. For an entrance, let the burlap project a little at one end. Put in three combs, and let them be those containing brood, if any such there be, when preparing for winter. Stand this three-frame case on end, in a two-story Simplicity hive, or chaff hive, as may be convenient, with the entrance fixed so it can not well get obstructed. Now pack your chaff all around, either loosely or with cushions. If fixed on a day when the bees can fly, you can shake them all down before the entrance, and they will go in of themselves. As the 3 frames are further apart than in summer, they will easily hold all the colony needs for winter, unless it is an extremely large one, and then you can use six combs instead of three. I am now quite sure I would rather have the stores in three combs, put a little further apart, than to have them in more. Our losses this winter have all

been, apparently, from the bees getting over to one side, or one end, where there were no stores. As this plan would, as a general thing, have to be arranged for during warm weather, so as to feed up to fill the three combs, we can't very well test it this winter.

### SIMPLICITY IN DETAILS.

HAS IT ANY THING TO DO WITH BEE CULTURE?

**T**HE older I grow, the more I am impressed with the importance of having work so it consists of only a few plain simple details. We are, as a class, awkward and unwieldy; and when I say *we*, I mean humanity, myself included. In my early life I got scolded on almost every side, because I could not understand on the impulse of the moment, and I haven't got over it yet. If they would give me directions, plain and simple, in a book, I could sit down and study it out; and on this account I soon began to prefer our school textbooks to an oral teacher. The teachers, many of them, had no patience with my slowness and stupidity; but the books had all the patience in the world, and would keep still and let me take all the time I wanted. So I loved the books, and by and by astonished my teachers because I had mastered difficult things in the books, without being shown by any one. Well, I suspect there are lots of boys and girls like me who will get along very well if you give them time enough; and when they go to school we usually give them time, I believe, until time, if I am not mistaken, oftentimes hangs heavily on their hands. But it isn't convenient always to do this. There are times when we want them to act at once; and the great problem is, to make every thing so plain that they can act at once, without danger of making a mistake. Some errand must be done before a train goes out, and a failure or mistake in directions may result in the loss of much money or hard work, and possibly loss of life. A lady mentioned, a few days ago, in a temperance lecture, that she was once in a strange city, and wanted to find a certain place. She received directions from different people; but although they were all very kind and obliging, their directions were all based upon the supposition that she had some general knowledge of the city, which she had not; and so she wandered, until, in despair, she applied to a small boy. His bright young mind took in the situation of affairs at once, and he directed,—

"Why, missus, you just go till you come to a house with an iron fence around it, and that's the place."

If she didn't know any thing about Detroit she knew what an iron fence was, no matter where she lived; and thousands of times in our lives we want just such directions as the boy gave. Now the point is, to have our wits about us so we can always give directions as intelligibly as the boy did. I expect you will come back on me and say I do not give my answers to your letters of inquiry as plain as an "iron fence," by con-

siderable, and I know they are not. The trouble is, we are getting so many iron fences, and every thing else, that even an old hand might wander helplessly if he didn't look out.

A friend has just written an article describing an outer shell to set over a Simplicity so as to make a chaff hive of it; or, in other words, to have a chaff hive so the inside could be lifted out and used as a summer hive. Now, although such an arrangement might be very handy, it would be complicating things so much more that I have thought best not to publish it, and so with hosts of new ideas. You may urge, that it will do no harm to let everybody describe his new inventions, and people can then use them or let them alone. Very true; but almost every thing of this kind I describe is ordered forthwith by some of our A B C scholars; and if I won't make it for them they get it made elsewhere; and then when it doesn't work, or fit in with plain directions I have given in the A B C book, they write me long letters of explanation, and want my advice. I am not complaining of this at all, mind you, for I want them to write and tell me all their troubles; but I complain of myself many times, because I have been so foolish as to publish so many new things to lead beginners out of the beaten path.

A little while ago we talked of grading the 1-lb. sections. Well, if everybody used them, and they were as staple as sugar and soap, I could easily do it; but if you push in on us with a  $\frac{1}{2}$ -lb. section, I should have to grade them too; and by and by even our warehouse wouldn't hold them all. More than that, if it did, the clerks couldn't find what it was you were sending for; and worse still, I should soon have my money all locked up in such a chaos of "odd sizes" I should be in danger of becoming bankrupt. Who would want to learn bee culture when it gets to be worse than learning a new language? Even the Simplicity hive that I have fondly hoped would be the Simplicity for a century at least, has had to have its frames put crosswise as well as lengthwise; has had to have a new top and a new bottom; and now friend Hasty wants to put shirts on them. We must stop somewhere, or we shall all turn to chaff, and blow away. There is no trouble about bees paying, if we would manage them as simply as we did when we first commenced; for every number of GLEANINGS, and JUVENILE too, is full of accounts of the very great results that have been attained by almost new hands with only a few bees.

It costs us tremendously to change bee-feeders or queen-cages. We have to do expensive experimenting, get new tools and machinery for making them, get engravings for GLEANINGS and the price list, and finally take out and fill in for the A B C book. I tell you, brethren, I am going heavy on "sticking to the old way," and I am going to stop inventing new things, unless there is a very large prospect of some great improvement being made, by just giving a little "twist or turn" to something we have got already. Won't you go with me?

## Ladies' Department.

### IMPORTING QUEENS, ETC.

YOUR valuable magazine is at hand again, with its cheerful countenance shedding light on our whole household. Mr. M., our twin girls, and even baby Clayton, says, "Has DEANINGS tum?" How much we should like to see its editor! Can you not make us a visit some day? You know our *quondam* far-away Texas has, by steam power, been brought almost within the neighborhood of Ohio.

I determined last August that I would import some queens, and, noticing the advertisement of Mr. C. Bianconcini, I wrote to him in plain English to please forward them to me by Sept. 15. His answer was written in plain English, but evidently written by a foreigner, as his peculiar expressions bore the stamp of one not familiar with our language, and carried with them a charm peculiarly fascinating to me. For instance, he alluded to "the traveling expenses of the queens;" and in his second letter he stated, "All is against us. After the unpardonable negligence of the correspondent of Havre, we have the delay of the floods for the overflowing of the rivers." I just wondered, if I should try to write a letter in his language, if I could make myself understood as well as he did. No, I'll take that back. I didn't wonder; I only thought about it, and knew I couldn't.

Not knowing how U. S. money rates with them, I had them sent C. O. D. They came on the 26th of Oct., in miniature hives (little boxes about 4½x6 inches), made of white pine. A hole about ½ inch in diameter in each side and end, over which was tacked a piece of wire gauze, which, for want of a better name, I will call *fall windows*, admitted all the air the little fellows got. Two frames of comb were in each box, and at least ½ lb. of bees accompanied each queen. They were nearly all dead, and I was surprised to find the queens living; but they were strong and healthy. I made swarms for them by following the directions in A B C for beginners, and in a few days most of the sealed brood had hatched, and I had a respectable colony of bees with each queen.

### WATER FOR BEES.

And now permit me to ask a question or two. Has it been demonstrated, that bees can live without water? The first queen I ever bought came in a cage that contained a small vial of water, with a sponge in the mouth, instead of cork. The bees were all perfectly healthy in that cage. Since then I have bought in all nearly 60 queens, and no provision for water was made in any cage. In nearly every one there were at least one or two dead bees, and in some there were more. I did not much wonder that they could come safely to Texas from almost any part of the United States without taking a drink of water on the way. I believe I could do that myself, though I should not like it much. But to start the little fellows clear across the Atlantic, without one drop to quench their thirst, I must confess I think borders on cruelty. The only wonder to me is, that the queens did not die too, and I no longer think it strange that imported queens cost so much.

### DRONE-LAYERS.

In your comment on my last, you ask if the queen to which I alluded was a drone-layer. I am inclined

to think she was, when these drones were raised; but your question implies that the opinion prevails, that a drone-layer is never of any account. She certainly was one of the best queens I ever had, for two months, when I lost her in extracting. I am only an A B C scholar in its truest sense, and I may be coming in contact with the opinions of experienced bee-keepers; if so, I beg their pardon. I can but make a simple statement of facts; and with all the respect that is due them, I take my place at the foot of the class.

MRS. A. C. MOSHER.

San Marcos, Texas, Jan. 12, 1883.

I am glad to know you succeeded with your imported queens, my friend; but why do you not tell us how many you imported; what they cost, and how many were dead? If you lost none in transit, you did better than most of us.—I believe it is generally conceded, that the amount of water in sealed liquid honey is enough to sustain the life of the bees, and many think perhaps it is all they care for. The difficulty of having water where they can get it, always pure and sweet, without any danger of wetting them, is still somewhat an unsolved problem. You know the bees seem to go all right with the Good candy, and that is *dry sugar* wet up with honey.—The only reason we have for thinking drone-layers are never of any account, my friend, is, that drone-layers, in the usual acceptance of the term, never lay worker eggs at all. If your queen first laid a frame full of drone brood, and after that laid worker eggs, she was certainly an unusual queen.

### FROM 5 TO 27, AND 200 LBS. OF HONEY.

I had only five swarms in the spring to start with, and as I was in the A B C class I divided them until I had 14 good swarms, and then I thought they would not swarm any more; but in August they commenced swarming, and they just made the air hum. I kept putting them back, and sometimes they would stay, and sometimes they would not; and then I would give them a new hive. The last swarm came out Sept. 5, and now I have 27 good colonies in good condition for winter. I got nearly 200 lbs. of surplus honey. They made me lots of work. I had no one to help me, and I had all the housework on a large farm to do. I tell you it kept me busy. My queens are all Italians, for I raised them.

MRS. M. A. WILKINS.

Seneca, Nemaha Co., Kan., Dec. 11, 1882.

You certainly did well, Mrs. W., considering that you had so much housework to do. If you accomplished all your work, at the same time caring for your bees, then assuredly those of your sex who have nothing but the bees to care for can not make the plea that, to work with the bees is too hard. It is rather unusual for bees to swarm so late in the season.

I take great pleasure in my bees, and feel well repaid for all I have ever invested. Only five swarms of black bees in the spring; have sold honey to the amount of \$46.50, besides giving and using quite a quantity, and three very large new swarms. Honey sold mostly for 16 cents. As I do not see any very good report from this State, I am satisfied.

MRS. E. M. CROSMANS.

Batavia, N. Y., Dec. 15, 1882.

## Heads of Grain, From Different Fields.

### SUGGESTIONS ON FOOT-POWER SAWS.

**T**ELL friend W. Z. Hutchinson to put his driving-belt on a rim built on the side of his driving-wheel, so as get the weight of the wheel outside of the belt. I at first had the belt of my foot-power saw on the outside of my driving-wheel; but an old mill-wright told me to fasten a rim about four inches from the face of the wheel, and I find it much better; the belt doesn't have to be so tight, and I get a better grip on the mandrel-pulley. I lose some speed to the saw, but I can feed faster, and the belt doesn't slip.

G. LUFF.

Salt Lake City, Utah, Dec. 14, 1882.

Thanks, friend L.; but I would suggest that perhaps in your case you had more speed than was best, for the kind of work you were doing. With one of the Barnes hand-rippers we found we could get excellent results with very heavy hard plank, by putting the crank right on to the other end of the saw-arbor. It was then virtually cutting direct on the stuff, almost as a man would with a hand-saw, only that there was no drawing back, and the stuff was cut exact. It may be, too, that yours was an iron balance-wheel, and it is well known that a belt works better on a wood surface than on iron. Aside from the above two points, I presume it is true that we shall get better results by having the main weight of the balance-wheel outside of the rim of the pulley that carries the belt.

### ONE AND ONE-HALF-INCH SECTIONS, WHEN NO SEPARATORS ARE USED.

I started with 20 swarms in the spring; increased to 50 by natural swarming; took 2000 lbs. of honey in one-pound sections, or, rather, in sections  $4\frac{1}{4} \times 4\frac{1}{4}$ , about 800 of which were two inches wide; and as I was experimenting for honey without separators, the remainder were in sections  $1\frac{1}{4}$  and  $1\frac{1}{2}$  inches wide. The result is, that I never want any more sections over  $1\frac{1}{2}$  inches wide, if they are to be used without separators, as there will be ten of the two-inch sections, to one of the  $1\frac{1}{2}$ -inch that will be bulged; in fact, out of 800 sections  $1\frac{1}{2}$  inches wide I did not have half a dozen that would not pack in the shipping-cases without any trouble; while of the 2-inch sections there were ten times as many. And another thing: I find that my  $1\frac{1}{2}$ -inch sections will be filled out nice and full, while the 2-inch sections will be but poorly filled. This being the result, I have about come to the conclusion to use only  $1\frac{1}{2}$ -inch sections after this, without separators; this will make the sections enough narrower so that we can get two more frames in a hive. I should like to have others try the narrow sections without separators next season, and report.

### FOUNDATION TO FILL THE SECTIONS.

I fill my sections about half full of the thinnest fdn. that I can get. I use the thin veneering, or fruit-box sections, that cost 75 cts. per 1000 in the flat; I have used them for the last three years; have shipped nearly all my honey to Chicago, and not lost a single section by being broken. My honey has sold for from 18 to 22 cts. per lb. But I have spun

this out too long already; so I will close by wishing you God speed in every good word and work.

WM. L. KING.

Sodus, Berrien Co., Mich., Jan. 8, 1883.

Not at all long, friend K., so long as you are discussing vital points like these. Friend Muth has for years advocated the  $1\frac{1}{2}$ -in. sections, used without separators; and, if I am correct, friend Heddon is following pretty vehemently in the same wake. I am glad to know you like filling the sections with fdn. —Will you please tell us where you get veneer sections for 75c. per 1000? And do you have entrances for the bees cut in them for this price, or do you put them in the hives a little way apart?

### A HANDY TABLE FOR THE HONEY-HOUSE.

While the subject of honey-houses is before us, please allow me to describe the table I use in mine. It is circular, 4 ft. in diameter, made of  $1\frac{1}{4}$ -in. pine boards. It is 2 ft. 5 in. high; the shaft, or standard upon which the table turns, is  $4 \times 4$  in., made of white oak. Any stiff scantling that will remain straight will do. The table is well braced on the under side; but the braces do not come so near the edge of the table that they come in contact with the knees when we are sitting up to it and turning it. The shaft has a  $\frac{1}{2}$ -inch iron pin in the bottom end, which goes through the floor with a piece of leather between it and the floor. This should have a little tallow once a year. The top end of the shaft is round, and goes through a hole made in a board that is fastened overhead. Now for the use of it: We fill the table with empty jars, cans, or pails, as the case may require, then fill all that can be reached conveniently. We then give the table a gentle pull, and with one motion, easily performed, requiring only a moment's time, we remove the filled ones and bring as many more empty ones right in their place, and so on until all are filled. About one foot above this table should be a smaller one, say 18 inches in diameter, upon which to put labels, etc. When the contents of the table are all filled, we just turn around, placing our feet under the table, and proceed to cover and label, turning the table as occasion may require it, until all are ready for packing for market. We then clear the table, and commence again. When we are crowded for time, one fills, another puts on the covers, while a third labels.

I regret that you still continue to write up blue thistle. To my mind, it is a grievous sin against humanity. Time will tell.

Bees are doing well so far.

S. T. PETTIT.

Belmont, Ont., Can., Jan. 12, 1883.

Thanks for your description of the revolving honey-table, friend Pettit; but I waited anxiously all through it to hear you say you had a place fixed to roll up a barrel so a honey-gate would deliver the honey right into the cans, as you turned them one after another right under it; or do you pour the honey out of a coffee-pot or pitcher, strainer pail, or something of the sort? I am not yet convinced the blue thistle in our garden will do any more harm than a stalk of its near relative, borage.

### A SHEET OF GLASS AS A HINDRANCE TO ROBBERS.

Reduce the entrance so but few bees can pass; then lean over the entrance a window-glass  $8 \times 10$ ; and if there is any fight in your bees they will stop

it. They will make a grab for the robber if he comes behind the glass. He dodges back and hits the glass; is confused, and keeps trying to get out and up the glass, and out at one side or the other. This will stop robbing, if there is any resistance shown at all. Try this, and don't you forget it.

Salem, Ind., Jan. 11, 1883. JOHN CRAYCRAFT.

The "glass" idea is old, and as you say, friend C., "when there is any fight in them" it will almost always stop it; but when a colony won't fight at all, it is of but little avail, until we give them some unsealed brood, or something to *defend*. Get the *inside* of the hive right first, and then these aids are a help.

#### KEEPING HONEY TO ACCOMMODATE CUSTOMERS, THE YEAR ROUND.

I will send in my report for 1882. I had 36 colonies in spring; got 1500 lbs. of comb, and 900 lbs. of extracted honey. I increased to 69 colonies; honey all sold at 20 and 25 cts. I sold my extracted honey for 20 cts., and still they come for honey. I should be glad if I had 1000 lbs. more to sell, for I hate to tell those cheerful-looking ladies, when they come after honey, that I can not spare it. I thought it would increase our sales of honey to keep it in stock the year round.

J. R. LINDLEY.

Georgetown, Vermillion Co., Ill., Jan. 7, 1883.

To be sure, it will pay, friend L. People don't have very much of an idea of a bee-man, if he doesn't *always* have honey.

#### AN APIARY OF 295 COLONIES.

The spring of 1882 found me with 175 colonies of bees, having passed the winter without losing a single colony, and all out-doors, and with the exception of 22 Italians, all were blacks. I raised a little over 200 lbs. comb honey, to supply a few "fine-haired" people in my own town, at 25 cts. per lb. All the rest was extracted. I got 13,000 lbs. and a little over; increased the bees to 295; am wintering all outdoors on their summer stands. I have sold about half of my honey at 10 to 12½ cts. per lb.; I have the remainder yet on hand.

#### A HOME MARKET WORTH SOMETHING.

My home market will take from 10,000 to 12,000 lbs. I am thinking of enlarging my bee business, if I can find pasture for them. I can handle 500 or more colonies. I raise nearly all extracted honey.

#### HIGH RATES ON SHIPPING LIQUID HONEY.

I shall have to ship off considerable honey. I find one thing about shipping extracted honey that is wrong; viz., the freight on honey from here to Chicago is 65 cts. per 100 lbs.; on syrup and molasses, 41 cts.—24 cts. difference on 100 lbs., and in the same proportion to other places. The fact, as it appears to me, is, the railroad managers have made their freight on honey, as *comb honey*, the most delicate and frail thing there is, almost, to ship, while extracted honey is a new enterprise, comparatively, and to this difference they have not had their attention called in particular.

Now, I think if our large bee conventions would appoint a committee to talk with the railroad managers about it, that this thing could be made right, and freight on extracted honey, in barrels be made the same as syrup and molasses. This extra freight must come out of the consumers, and will debar a great many from using it. I hope others will look after this matter, and try to get it as it should be.

I think it can be done, and would be a great help in selling our honey. The railroad men are not so very unreasonable. As a rule they will do the fair thing, if we approach them in a friendly manner, when they have time to attend to us. Honey can be shipped as syrup, but it doesn't look just right, does it?

EDWIN FRANCE.

Platteville, Grant Co., Wis.

I should think 10,000 or 12,000 lbs. a pretty big home market, friend F., unless, indeed, you go to all the large cities around you.—This matter of rates of freight on honey is indeed one that needs looking into. A few years ago they classed all bee-hives as double first-class, even when in the flat; and even now there are some roads that will coolly put on this enormous rate, and say all bee-hives in any shape are classed so. Since the matter has become understood, that bee-hives are no longer great bulky frail structures, with glass "drawers" in them, we have, with most roads, a respectable rate of third class for hives in the flat. If they have the idea, as you suggest, that all honey is a "breakable," we ought surely to have it righted. It occurs to me, however, that syrups are generally shipped from large cities only, where merchants have low rates to all small towns, and that honey is shipped only by the farmers, to cities and towns, so it can not go at the regular rates of syrups from the cities, but must go at a local rate. Will the Thurburs please tell us if they can ship honey as cheaply as they do syrups to their customers? If not, we will surely have our conventions take it up.

#### CELLARS MADE OF CONCRETE.

Yes, our cellar is made of concrete, such as friend Savage describes on page 24, except that we used nothing but sand and gravel from the lake shore, and large stones from the field. We used water-lime, or cement, except for about 16 inches that is above ground. I think it is the best cellar I ever saw. Our bees wintered in it last winter without loss, and a part of them this winter, and they are doing well. It is the cheapest way a building can be made, where there is plenty of material at hand, and it can be made to look as well as any brick or stone building ever made. We used one bushel of cement to three of sand, three of fine gravel, three of coarse gravel, and as many large stones as we could work in. Holy-Lands are the best. ILA MICHENER.

Low Banks, Ont., Can., Jan. 10, 1883.

#### BUYING HIVES WITH A "PATENT," ETC.

In the spring of 1881 I bought one swarm of black bees; have taken during the whole year about 15 lbs. of comb honey, no increase. The industry of the little creatures, and the sweet of the honey for my children, made me interested. In the fall I bought another swarm of black bees in a patent hive (with patent) for \$12.50. Knowing nothing about scientific bee-keeping, I thought I had a little fortune on my wagon. The secret was all in the patent moth-trap attached. To-day the hive is placed in a corner, and is for sale at \$1.00, *with patent*. My bees are transferred to a Simplicity hive. In the spring of 1882 I bought one more swarm, in box hive, for \$3.00. This made me three swarms to commence with. Then I bought the Simplicity hive, and a friend let me have a copy of GLEANINGS and his A B C. I saw the value of them, and ordered both. By their help I increas-

ed from 3 to 15 by natural and artificial swarming; 3 ran away; cause, press of farmwork. All are in fine trim, in Simplicity hives. I have Italian queens, partly bought and partly my own raising. I introduced 12 queens for others and myself, and have not lost a single one. Some cross swarms of them tried my patience for eight days, but I was glad to get the queen at last. I sold \$20.00 worth of honey, and my family have sufficient to last till spring. I myself am now an enthusiastic A B C scholar.

I know, friend Root, that you have received many better reports; but mine is so satisfactory to me, especially if I take the year before in comparison, that I feel myself under obligation to Dr. Lay, of Hallettsville, for first calling my attention to A B C and GLEANINGS, and for much kind advice, and especially to you and other writers for spreading the knowledge of modern bee-keeping. A. MEYER.

Sweet Home, Lavaca Co., Texas, Jan., 1883.

Thanks, friend M., for your kind letter, and I wish you would tell Dr. Lay we should be very glad to get a line from him; for after hearing him talk at the Cincinnati convention, we feel sure he could entertain as well as enlighten the "brethren."

#### A MILLER AND ROACH EXTERMINATOR.

Yes, sir; and a complete success every time. I know that, whenever a man mentions a moth-trap, bee-men are ready to cry "humbug," "put him out," etc. I will say to all who are not acquainted with my method, hold on, as I will give you something very valuable, but not patented. Well, here it is: Inclose your apiary with a close fence, and then keep as many ducks as bee-hives (mine are mallards). My word for it, during the season of the year that the millers and roaches bother your hives, your ducks will work for you every night as long as they can see, catching millers and roaches. But they will never touch a bee. I call your attention to the profitableness of this moth and roach exterminator. Try it and you will be pleased.

#### WHERE WILL OUR FRIEND FIND THE BEST PLACE TO KEEP BEES?

As this is not a good locality for honey, I want to ask the readers of GLEANINGS if any of them can direct me to a first-class place to locate an apiary and hennery. I wish to run about 200 stands of bees, and keep from 500 to 1000 chickens. I should like to locate near a good market for fowls. To any one who will point out such a location I shall be under lasting obligation. Mr. Editor, have you not some place to call my attention to? A. L. FOREMAN.

Milton, Ill., Jan. 8, 1883.

Thanks, friend F.; but while reading of your remedy, I got to wondering if I was sure I wouldn't rather have moths than ducks, if I must have one or the other in the apiary; but perhaps many of the brethren would rather have ducks, and I am pretty sure they would "oust" the moths, after they once got the trick learned.—In regard to a location, I might advise you to open a ranche beside some of our Western friends, Oatman, Miller, the Dadants, and others who have made such immense yields this past season; but if I did, next year they might all have a failure, and then you might blame me. To tell the truth, after reading the reports so many years I am very much at a loss to say where is the best place. Sometimes it is here, and again it is there; and in the end

it seems to be where we have the most enterprising men located. Why not go and settle down by Doolittle? If you shouldn't find his locality so much superior, you could doubtless learn how of him, and that would eventually amount to the same thing. Then comes the question, couldn't you do it cheaper, and stay where you are? I am inclined to think you could.

#### BEEES IN WYOMING TERRITORY.

Last spring I brought the first honey-bees to Wyoming Territory that were ever tried in this new and wild region. People have heretofore supposed that no honey could be made here, on account of the short seasons and nothing but wild flowers to gather it from; but my two stands of bees did remarkably well; in fact, as well as I ever saw them do in Wisconsin, and they are all right up to this date. They filled several boxes full of splendid surplus honey, and worked well till the first of October; and when I had occasion to move them, it was all two men could do to lift each hive into a wagon, so great was the weight. I did not divide, but think I lost some natural swarms. G. G. MEAD.

Rawlins, Wyoming, Jan. 12, 1883.

#### AT HOW LOW A TEMPERATURE WILL OR CAN BEES FLY?

A few nights ago we had a light fall of snow; the next day I took the broom and my hook to clear the snow away. I hooked into one gum to haul out (at the entrance) the snow and dead bees, if any, when, behold, out came 2 or 3 dozen bees, and flew off quite a distance, and circled around, and went back in the hive, and only one fell on the snow, that I could see, and that I helped in the hive. It was still and clear, and I stepped to the tree where the mercury was, and it was just 10° above zero, and no mistake. I was surprised. JOHN W. C. GRAY.

Atwood, Piatt Co., Ill., Jan. 14, 1883.

#### FLAX STRAW AS A SUBSTITUTE FOR CHAFF, ETC.

In the fall of 1881 I packed four good strong colonies in flax husks, taken from the flax while scutching. I believe this is one of if not the best absorbents we have in Canada, and mice or other vermin will not work in it; packed similar to friend Jones's plan. All came out strong in the spring. One lost their queen (mentioned in July GLEANINGS); though I tried hard to get a queen early for them, it was late before I succeeded, and my strong colony was reduced, so that I had only three to get honey from. However, I was favored with about 160 lbs. of beautiful comb honey in 1 and 1½ lb. sections, which I succeeded in getting first prize for at our fall fair. I also increased to nine. One swarm that issued on June 27, made in 1½ sections over 40 lbs. This is the best I ever heard of around here for a first swarm. I bought one swarm, so now I have 10 nicely packed in flax chaff and dry sawdust, and all furnished with young queens. All are Italians, except one Holy-Land queen. WM. HASTY.

Brussels, Ont., Can., Dec. 18, 1882.

#### TWO VARIETIES OF NATIVE BEES IN MISSISSIPPI.

We have two varieties of the common bees in this section of country—one small, dark, and extremely cross; the other, larger and yellower, and better natured. I found a tree of the latter variety this past summer, from which I obtained about 30 lbs. of honey, very white and well flavored. I succeeded in saving the bees, and am feeding them this winter,

which is considerable trouble, as they are in a common square hive. I feed them with best sugar dissolved in water, which I place in a saucer, and spread a cloth over it. In a warm day they will empty the saucer in about two hours. They will not eat sorghum or N. O. molasses, to do any good.

Soft-maples bloom here the last of January or first of February; we have had a steady succession of fruit-blooms from that time until the last of March.

#### HONEY-DEW.

Sometimes the honey-dew is 1-16 of an inch deep on the leaves; when this is the case the bees gather honey very rapidly.

C. G. BLAKSLIE.

Pine Grove, Benton Co., Miss., Dec. 27, 1882.

I wish, friend B., you would send me bees of both these varieties in a cage, if you are sure the larger ones you speak of are not Italians. From your description I should think they might be, and it would be nothing strange if the Italian blood had by this time made its way through the forest for hundreds and possibly a thousand miles. Bees will never eat poor sugar or molasses, when they have access to something better.

#### THE PERFORATED ZINC HONEY-BOARDS, ETC.

That zinc honey-board, on page 10, in GLEANINGS of this month, suggests to me that, if sections were put as close to each other as the holes are wide, they would make a "queen-excluder." How wide are the holes in the zinc? Is it put on close to the lower frames? Have those that have used it found no combs between it and upper story? John Myers (page 35) reports that Heddon's honey-board answers as well for sections. What is the width of the holes in the board he used? I think of trying the zinc.

Hartstown, Pa., Jan. 10, 1883.

P. MOYER.

The holes in the zinc are 11-64 of an inch wide. It would not be possible to make holes in wood sufficiently exact for this purpose. We put it on close to the lower frames. All who have used it say no combs are bridged over it. The spaces in Heddon's honey-board are about  $\frac{3}{8}$  in.

#### FOUNDATION-MILLS; QUERIES.

Do your 12-inch mills work as well as your 10-inch? Would the 10-inch make fdn. that would answer for Gallup frames? Does yours make perfect sheets of fdn. to outside of rolls, or, in other words, does a 10-inch mill make fdn. that width? How many pounds would be an ordinary day's work? Does it require much experience to make good sheets? I examined 24 stands of bees yesterday and all are in good order, packed in chaff hives and in sawdust.

J. S.

Morpeth, Ont., Can., Jan. 19, 1883.

The 12-in. mill will make just as good fdn., unless it be a little more difficult to make very thin on it. It runs easier than the 10-inch mills, because it is back-gear'd, as you will see in the cut; but it runs out the fdn. so much slower, that a 10-inch mill, not back-gear'd, is preferable by far, for making fdn. that will work nicely in it. Any mill will make sheets the full width of the rolls, but it is so difficult to keep the sheets running straight, where you make them full width of the rolls, that it is hardly practicable. It is for this reason we decided on a 10-inch mill, instead of 9, for making sheets for the L. frame, 8 $\frac{1}{2}$  inches wide, or thereabouts. Two good smart hands should

make 200 lbs. of brood fdn. in a day, and perhaps half as much for sections. Any one ought to make good fdn. the first day; but of course they will make better work, and faster, with more practice. A 10-inch mill would answer for Gallup frames, but 12-inch would be preferable, for the reasons I have given.

#### FROM 4 TO 13, AND 300 LBS. OF HONEY.

My bees did well, I think, for a beginner. I commenced the spring of 1882 with two old colonies and two new swarms that I bought in the spring, and increased to 12, and got over 300 lbs. of comb honey, without disturbing lower stores. I am wintering on summer stands, part in double-walled hives, and part in single hives, without chaff or cushions. I will report in the spring, and perhaps apply for space in Blasted Hopes. I like to work with the bees, but they always would, and I think always will sting me. I think you should be a little careful how you advise your patrons to work with the little pets without veil or gloves. Perhaps you don't know how they get punished.

A. LIVINGSTON.

McVey, Ill., Jan. 8, 1883.

#### GOOD REPORT FROM HYBRIDS AGAIN.

My 12 swarms of hybrids, brought from Illinois last spring, increased to 30, all in fine condition now. I moved them the 6th of this month about  $\frac{3}{4}$  of a mile to my little farm. They yielded 1600 lbs. of the very best of white-clover, smartweed, and yellow Spanish-needle comb honey. The smallest swarm I hived weighed 3 $\frac{3}{8}$  lbs.; the largest, 10 $\frac{1}{4}$  lbs. The latter issued August 27, from a colony hived July 1 (same season); gave 21 lbs. surplus. I was over-taxed with work, as it was my first season here, or I could give a better report.

WM. S. ROBERTSON.

Brookfield, Mo., Jan. 8, 1883.

I wrote you some time ago, as you are the Secretary of the National Bee Convention, to try to find out who was appointed vice-president for Maine. I see it was A. G. Mason. You wrote me it was intended for myself; if that is the case, will you be so kind as to make the correction in GLEANINGS. I feel interested, as I wish to have the State of Maine represented next fall, and do not want to interfere with another man's business, as it might make hard feelings. If there is such a man as A. G. Mason.

JAMES B. MASON.

Mechanics Falls, Me., Jan. 12, 1882.

If there is an A. G. Mason in Maine, will he please "stand up"? I always knew I wouldn't be a good Secretary.

#### CONCRETE FOR A HONEY-HOUSE.

I see D. F. Savage favors concrete buildings. I know a little about them; they are almost sure to be damp. They are also very cool in summer — too much so, I think, for ripening honey. The first objection may be partly overcome by thorough ventilation. My first winter's experience in teaching school was in a house of this description, and the people said it had never been comfortable in the winter, the walls being covered with frost all through the season. I got some tools and fixed the windows so I could let them down at the top; then I lowered them about six inches every night after school, and left them until morning. Although the winter was a very severe one, we had but little frost on the walls of our schoolroom. One night, however, we

had the worst "blizzard" I ever experienced, and I took out about 12 pailfuls of snow the next morning.

BURDETT HASSETT.

Howard Center, Ia., Jan. 8, 1883.

Many thanks, friend H., for the very valuable facts you have given us. Brick buildings are now made to overcome this objectionable feature by making the wall hollow, and this is the way our dwelling-house is made. It is as dry as any frame building.

FROM 30 TO 53, AND 4700 LBS. OF HONEY, BY A "SELF-MADE" BEE-MAN.

The 1st of June, 1882, found us with bees in 30 hives. Nearly half of them were one, two, three, and four frame nuclei. We increased to 53 colonies, with abundant stores for winter, and obtained 4700 lbs. of honey; 1097 lbs. of it was comb, the rest extracted. I make all my own hives, frames, and sections; and all the tools I have are two saws (one rip and one cross-cut), two planes, hammers, square, thumb-gauge, scratch-awl, and a work-bench. I paint my own hives; in fact, I have done all the work of my apiary, except the assistance of a young man one day; and my wife nailed about 500 sections for me.

The honey of every hive was weighed separately, and that, too, on a balance with only 16 lbs. of weights, so that most of the time but two combs could be weighed at a time. A record was kept of every hive, and the amount of comb and extracted honey credited. The extracting was done with an extractor of my own construction, made of inch pine lumber, for 2 frames (Langstroth). It holds 65 lbs. of honey below the rack, and is not so "awful big" either, as one of my neighbors carried it on his shoulder over half a mile, extracted the honey from his hives, and carried it home again twice during the season.

S. A. SHUCK.

Bryant, Ill., Jan. 12, 1883.

Why, friend Shuck, you are a "trooper," a regular self-made bee-keeper, and one who makes his way independently of supply-dealers, or any other kind of claps who so harass and distress those who depend on buying every thing. I don't believe you have a farm on your hands, or much other business, do you? Please tell us how much you got from your best colony, if you kept it all weighed so carefully. In short, we should like to know all about how you do it, if you will be so kind. Many thanks for items already given.

WOOD SEPARATORS; A WORD IN FAVOR OF THEM.

I would add my testimony in favor of wood separators. I have used tin, and do not see that there is a whit more liability to attach comb to the wood. Now, the question is open again as to discarding separators entirely. My advice is to go slow in that direction. Who that has tried it has not had his patience tried also in casing it for market? If certain conditions are carefully observed—to put in full combs or sheets of fdn., and to keep them exactly perpendicular in hive, most of the sections will grate well enough; but I have never known them to be invariably so.

HONEY-ROOM.

I built last summer a storeroom for the purpose of ripening as well as storing my honey, which pleases me so well, and was so easily put up, that I will describe it. It is 8x12 feet, with single-pitch roof, but

nearly flat; 7½ feet high in lower side, and 8½ on upper, with close sheathing, and tin roof on that. It is planked up and down and battened, and lined on the inside with building-paper. A strip of tarred paper or roofing-felt at bottom, is held in place by a strip all around next to floor as a protection against insects; a tight floor, tongued and grooved. There are no timbers about it, except stout sleepers fastened at the ends into others like them, 2x8 in., with spikes, all resting in solid foundation. I stored 4000 lbs. in this, and believe I could have put in double, and I have never had honey keep so well in comb, nor so well ripened extracted. There is one window with wire screen outside, running up 10 inches above window, to let bees out. A screen door outside is needed to enable one to work at all in warm days inside. There are no insects to bother, and no shelter for mice; warm and dry, and cheaply built. It is too small for an extracting-room, which I had already, but it is preferable to have the honey stored in a room used for nothing else. It would be well to have it longer, say 8x20, with extracting-room at one end, with 2 windows in that part.

J. W. PORTER.

Charlottesville, Va., Dec. 25, 1882.

The following is taken from the proceedings of the Western Bee-Keepers' Association, held at Independence, Mo., Dec. 23, 1882:—

#### HALF-POUND SECTIONS.

Mr. Salisbury stated that the tendency, especially in the East, was for smaller packages of comb honey weighing not more than one-half pound, as having a ready sale at a higher price, and more satisfactory for general use.

L. W. Baldwin thought that one-pound packages were small enough for practical use, as the change of apparatus, etc., of the apiary for procuring comb honey in smaller sections would be accompanied with great expense. He stated that he had sold his crop of comb honey the present year, put up in 1½-pound sections, at 23 cents per pound in the Kansas City market.

#### REPORTS.

There were represented at the association about one thousand colonies of Italian bees and 26,000 lbs. of honey, distributed among the different members as follows:

NAMES.	No. of Colonies In spring.	No. of Colonies In fall.	Extr'd Honey In pounds.	Comb Honey In pounds.	MODE OF WINTERING.
Jas. A. Nelson...	47	63	700		On summer stands.
J. D. Mearns...	25	55	1000		On summer stands.
C. M. Crandall...	52	73	1200	1000	On summer stands.
S. D. Gregg...	34	50	1200		On summer stands.
F. J. Farr...	95	116	1500	4000	In cellar.
J. H. Jones...	40	103	700	2000	In cellar.
J. W. Baldwin...	150	207	2825	3175	In cellar.
F. Baldwin...	120	145	900	4000	On summer stands.
S. W. Salisbury...	61	100	2400	500	On summer stands.
E. M. Hayhurst...	110	110			Principally engaged in the queen-rearing business.
Total.....	637	1054	12925	14675	

The association invites all bee-keepers within reasonable distance to join or attend its meetings, and help in bringing the bee-keeping interest more generally before the public, advance the production, and extend the markets of its products. It also extends an invitation to all ladies interested in any way in bee culture to be present and take part in the discussions of the association.

## WHO IS JULIA?

In our Jan. No. I asked friend White who "Julia" was, to which he replied as follows:—

Yes, Bertha and Daisy are intimately acquainted with Julia. She is not a bee-woman, but a honey-woman — at least, she is the sweetest woman I ever saw, and I know she is composed of something sweet. I don't think she is flavored quite as highly as clover and linden honey. I guess the "wheat-stubble" honey explains it.

DAN WHITE.

New London, O., Jan., 1883.

## A SUGGESTION FOR THE REMINDERY FOR FEB.

If you have your bees on 6 combs about the first of February, you will find the bees at the top of the frames under the Hill device, if you use one. Now comes the trouble. If the weather sets in cold for ten days or two weeks, so that the bees can't spread out, they will be compelled to eat pollen, and then comes dysentery. Now, to prevent this dysentery, the first warm day in February you should go over all your hives and give them a comb of sealed honey; and if it is too cold to handle them, cut a comb from a frame, and place it under the Hill device, on three small sticks, and see how soon the bees will find it. If you have no sealed honey, make syrup from the best sugar, and put in a shallow pan, and cover them up warm, and see how the dysentery will disappear. Bees are wintering all right.

Oakley, Ia., Jan. 16, 1883.

WM. MALONE.

## BLUE THISTLE.

Division Grange, No. 1, situated in London, Ontario, D. C., in discussing the introduction of various weeds as honey-plants, apprehends great danger to the farming community from the introduction, for that purpose, of the blue thistle (*Echium vulgare*), and the following resolution passed: Moved by J. M. Kaiser, Sec., by J. K. Little, that this Grange learns with alarm and regret that certain bee-keepers, especially A. I. Root, of Medina, Ohio, advocates, through GLEANINGS IN BEE CULTURE, of which journal he is publisher, the cultivation of noxious weeds as honey-plants, particularly the blue thistle; and he is hereby respectfully requested to do so no more. It was further resolved, that a copy of the above resolution be sent to Mr. Root, with a request that he insert it in GLEANINGS. Hoping that you will comply with the above request, I remain yours respectfully,—

J. M. KAISER, Sec'y L. D. G.

Raper, Ont., Can., Jan. 18, 1883.

My good friends, I have never advised anybody to plant blue thistle, that I know of, and I have only one plant in my garden, after trying three or four years to get it to grow.

## THE A B C "CHILD" THAT GREW SO FAST, STILL ALIVE AND STILL A BEE-MAN.

I have just disposed of the last of this year's crop of honey, 4500 lbs., at 20 cts. cash, and now must look around me for a start for the coming season. I am the A B C child that grew so fast; and the more I know, the less I write of the secrets of bee-keeping, and I think this is the way with all. When we have 5 to 20 hives, we write every thing we learn, which must be tedious reading for older bee-men; after we get among the hundreds we keep silent. You predicted at first that I would give up the business, being too enthusiastic; but not so. I have made a success of it, and am now a specialist, having dropped all other pursuits. I have found the great secret

in obtaining large yields of honey is in having swarms properly. The best plans and most successful manipulation have never appeared in print.

Arcadia, Wis., Dec. 26, 1882.

E. A. MORGAN.

Glad to see you again, "child;" but I don't quite see how I can agree with your last observation. If I am correctly informed, it is not necessary to have any natural swarming at all, in order to get the best results. In fact, we have been told the way to get enormous crops of honey is to keep down the swarming fever entirely, by the use of the extractor.

FROM 45 TO 64, AND 11,135 LBS. OF HONEY; 248 LBS. PER HIVE ON AN AVERAGE.

The season of 1882 was the best for honey here for the last ten years; 100 lbs. per hive, spring count, I have thought a good yield. My average per hive, spring count, was 248 lbs.

No. of hives in fall of 1881 was 45; in spring of 1882, 45; in fall of 1882, 64. Sold 11 swarms as they swarmed; had 3710 lbs. comb honey; 7425 lbs. extracted honey, or 11,135 lbs. in all.

My bees are all in Quinby or Simplicity hives; 23 in chaff hives; I am going to put them all in chaff hives, as I have not yet lost one in such.

JAMES H. COX & SONS.

Hudson, Ill., Jan. 19, 1883.

Why, friend Cox, we shall soon be ready to hear almost any thing of you Western people. I don't know but I should like to be one of the "sons" too, awhile, if I could only learn how.

## SWARMING BOXES OR "BUSHES."

I have seen a great deal in GLEANINGS about swarming-boxes, and various other devices for catching swarms of bees; but I like my own the best, which is made of small hemlocks, from six to ten feet long, trimmed nearly to the top, with several old mullein-tops fixed in the top so as to look like a swarm of bees a little way off. When they come out I keep watch and see where they are going to cluster, and hold my bush right there, and they will alight on it nine times out of ten; then I carry them where I want them.

E. B. SMITH.

New Milford, Susq. Co., Pa., Jan. 1, 1883.

## BURYING BEES.

On page 41, Jan. GLEANINGS, William C. Holmes inquires about rats and mice getting into hives buried in the ground without bottom-boards. Poison them with a piece of meat, or a pan of meal with a spoonful of arsenic mixed. I bury part of our bees; have had splendid luck; never lost any. Two that were queenless went into hives that touched their own. I was taught a little different mode of burying bees than I have seen in GLEANINGS. On a dry side hill we dig a trench  $3\frac{1}{2}$  feet wide. Upper end is nearly 3 feet deep; a ridge-pole the whole length, resting on stakes. We set two rows the entire length, as close in the rows as we can get them. Use pieces of boards, or pieces of wood, from ridge-pole to bank; hay or straw enough to keep the dirt from falling through; then six inches to one foot of earth is plenty. We leave them until warm weather, shovel off the dirt, and then set them out as fast as we can. It would not do to try to set them on summer stands, but set them here and there. After they are done flying, set them where we wish them to remain. That is my mode. They always find the right hive, or come out even. I leave them in the

pit, or clamp, sitting on the bottom-board of their hives; two auger-holes in front end of hive; very little opening on top. FRED TIMMERMAN, 75.

Fayette, Fayette Co., Ia., Jan. 10, 1883.

I presume, friend T., you object to putting each hive at once into its permanent place only because of the time it takes. If they can be handled so quietly that none are determined to fly out, I think I should prefer to have every one in place as fast as set out. I don't like hives sitting around "promiscuous like."

#### BEEES IN SOUTH CAROLINA.

As I see so little in GLEANINGS about bees or honey in South Carolina, I thought perhaps a few lines from one who has had a few years' experience in modern bee culture in this State might be of interest to your readers. The first thing is, the bees of this part of the State, with few exceptions, are kept in box hives. It was just fun to see the looks of astonishment and wonder on the faces of the old "box-hive" men when I first placed your one-pound sections on the market. Well, I was not surprised at their looks, for they were nice enough to make an old veteran wonder; that is, a veteran in the bee business. A great many were surprised to know that each hive contained a queen. They knew there was a "king bee," but few had ever heard of a queen.

I have seen the opinions of many in your invaluable journal, on the color of Italians. Let me say, right here, that, for honey-gatherers, I will hold up my hand every time for the dark ones, although I invariably raise other than light ones for the market.

My apiary of Italians is situated about two miles from the basin of the Wateree River, which is about four miles wide on this side, and grown up in a dense swamp. This supplies our bees with honey of the choicest kind during the months of April and May, and in great abundance. We do not plant any thing for the bees as yet, not having advanced that far. Some years they get considerable honey from cotton, which is grown extensively here. Our main honey-crop is gathered before the middle of June, after which, until the cotton blossoms, our bees are idle. I wonder if any of your readers ever saw a swarm of bright yellow Italians in the air, just about sunrise. I don't think there is any sight about bees more beautiful. The scarlet rays of the just risen sun shining on the yellow bodies of the little chaps gives them the appearance of so many golden beads sailing about in mid air.

#### CARING FOR QUEENS PURCHASED IN SPRING.

There is one thing I wish you would do; that is, direct your A B C class how to manage early queens when they first take them from the mails, as sometimes they get them a little chilled in April or May from the South, and, without giving them even a warming, ship them right back to the more genial clime of the sunny South. W. J. ELLISON.

Stateburg, Sumter Co., S. C., Dec. 22, 1882.

Your concluding remark is a good one, friend E. We know by our own experience that new hands at the business do sometimes call a queen dead, when received in the spring months, when she is really only dormant, and stiffened by the cold. Holding them in the hand, and breathing on them, will often bring them to life; but we have had cages of bees that had to be kept in a warm room 8 or 10 hours before they revived; but they seemed all right after the

awakening. Never decide a queen to be dead, until you have given them a chance to revive, as I have stated. As soon as able to move, a little warm honey on the tongue of the queen will often give her strength to get up and make her toilet.

#### WIDE FRAMES OF SECTIONS; HOW TO GET THE FIRST ONE OUT OF THE HIVE.

I have just read your reply to C. W. Young, page 40, Jan. GLEANINGS, to his question how to get wide frames and sections out of the hives. Let me give you my method. My supers are 16 $\frac{1}{2}$  wide, inside measure, but I put in only 7 wide frames filled with sections, and either a frame 1 $\frac{1}{4}$  inches wide filled with fdn., or one filled with comb. I usually put the frame of fdn. or comb in the center of the frames in the super, and, being narrower than the frame containing sections, it does not touch them on either side, and can easily be removed at any time, and the frames of sections taken out without trouble. As often as the narrow frame is filled with honey I extract it and put it back again. If a frame filled or partly filled with honey is used it will generally set the bees at work in the sections at once, if they are in proper condition.

#### BIG REPORTS IN THE JOURNALS.

Now a few words about some of the big reports that we occasionally read in the bee papers. What puzzles me is the fact that the largest reports are usually made by those that are just beginning, and have the least experience in the business. A ten-fold increase of bees, and 100 lbs. of surplus honey per swarm, spring count, is something that has never been reported by such specialists as Doolittle, Heddon, Given, Dadant, and others of their experience. I sometimes think that those making such large reports must have a very favorable location, or else they have got a strain of bees unknown to other bee-keepers, or else they are — well, no; I won't say romancing, when they make their big reports, but they are at least very fortunate. A bee-keeper living near me reported in GLEANINGS a few years ago, 115 lbs. of surplus comb honey per swarm; but to my personal knowledge, half of the amount reported was not taken from the best hive. I have had 12 years' experience in the business, but I don't know half as much about it as I did (or thought I did) 11 years ago. I have had over 100 swarms some of the time, and the longer I keep them the more I find I have to learn.

O. E. COOLEY.

Ridgeway, Ia., Jan. 11, 1883.

The plan you give, friend C., is the old one of getting out the first frame of sections. As given in GLEANINGS some time ago, we set this single comb into the center, and put three wide frames each side of it. Of course, they were arranged so the separators were facing this central comb, which might have a little brood in it, to induce the bees to go to work at once in the sections. After it was used extensively, it was found the bees would fill the comb so often that we got a great deal of extracted honey, while we might have had comb honey. It was also inconvenient to wedge up the wide frames with their sections, and we can not well get real nice straight honey, unless the sections are wedged up so as to keep the separators straight, and not leave interstices for the bees to fill with propolis. — The fact you mention, in regard to large reports from new

hands, was commented on at the Kalamazoo convention. Two reasons may be assigned for it. One is, that our old bee-men have without doubt overstocked most of their localities for average seasons. Another is, that the fresh enthusiasm of an A B C scholar is often worth more than the ripe experience of one who knows how, but don't do it, always. The new hands work with a will, and leave nothing undone: old hands often get lazy or indifferent. The reports through GLEANINGS, month by month, bring this point out in a most wonderful manner. Aside from this it is likely that an untruthful man might turn his attention to bees. If he is untruthful in other things he would most likely be in his reports. The best way to cure him is to give him to understand that untruth, like murder, will out, and to go right to him and tell him of it. Of course, *very great care* should be used in doing this, that we do not wrong an innocent party. Very few of the reports we have given have ever been questioned, and by far the greater part of them are corroborated by the neighbors, for most bee-men are such a genial, neighborly sort of people, that they call in their neighbors to see what wonders they are doing.

#### PARALLEL BAR TO SAW-TABLE.

I have just been reading your directions for fitting up a buzz-saw, in the Dec. No., and can agree with them fully; but there is one thing you omit, in telling how to place the parallel bar on the saw-table. To have this bar so it will at all times be perfectly parallel with the saw (and this is very important to do good work) at whatever distance from it, it is absolutely necessary to have the bars of iron on which it swings, *exactly* of the same length, measured from the holes in the ends of the bars where they are screwed or bolted to the wooden bar, or gauge, and the table. To adjust it properly, place the gauge-bar exactly parallel with the saw, and then extend the iron bars at exactly a right angle with the gauge-bar, when they are screwed or bolted to the table. This may seem like a small matter to write you about; but a lack of this knowledge once caused me considerable bother and perplexity, and then I had to go back to the blacksmith shop and get another pair of irons made. Before I took Mr. Greeley's famous advice and "went west," I had a shop with steam power, and quite a lot of wood-working machinery, and hence feel a good deal better posted in that branch than I do in any thing pertaining to bees.

E. HUNT, 25.

Sheridan, Montcalm Co., Mich., Jan., 1883.

You are right, friend H. I have had exactly the trouble you mention. These irons, when bored, should be screwed together, and then they are exactly right. Furthermore, the holes in them should be at least  $\frac{1}{2}$  inch, and they should turn on pivots of tempered steel, so as to avoid any shake or spring. Boards sometimes have a fashion of crowding, and running on the saw, and we want this bar to hold them right to the mark.

#### HONEY FROM ASPARAGUS.

Is asparagus a honey-producing plant? I have a small patch in my garden, which, after having been cut as long as wanted in spring, is allowed to run

up and blossom and go to seed. It remains in blossom a long time, and I notice that, while in bloom, great numbers of bees are very busy upon it from early dawn until dark. I am satisfied that they gather quite an amount of pollen from it; but what amount, and what quality of honey, as yet I am unable to determine. The flowers are very numerous, small, and of a rather peculiar shape, having an almost bell-shaped, six-partite perianth upon an articulated stalk; six stamens, one style, with three recurved stigmas. Who has had experience enough to tell us more about it? Bees certainly work upon it very diligently; and if it should be positively ascertained that it produces an abundance of honey of good quality, it would be a profitable crop for bee-keepers to cultivate, from the fact that it is a vegetable that sells well in market, at remunerative prices, in the early spring months, while enough might be left to run up and blossom for the bees to work upon. It would come in bloom, too, when other honey-producing plants are gone.

H. V. N. DIMMICK.

Hubbardsville, N. Y., Jan. 22, 1883.

I, too, have seen bees at work on asparagus, but our patch was so limited I could not well ascertain how valuable it might be. Will those who live where it is raised largely, tell us more about it?

#### THAT STATISTICAL-TABLE MATTER. HAVE YOU ATTENDED TO IT?

I wish you would give a *strong urge* in Feb. number about sending in reports (editorially.) A steady stream has been coming for 2 or 3 weeks, and it looks like a good success; but some, perhaps, may think the omission of one report makes little difference, or that they have sent their report to conventions. Now, if you lay yourself out on it you can, I think, get each reader of GLEANINGS to report. Mercury 31° below zero yesterday; 29 to-day.

Marengo, Ill., Jan. 22, 1883.

C. C. MILLER.

You hear it, friends! Now please go, this minute, and give friend Miller that report on a postal. If we don't give the world some statement of what we are doing, how will they know it isn't all glucose, and that we are a class of frauds banded together, just to impose on honest, hard-working people? Don't make good resolutions, but just act. If you get the postal, and put it down right now, it will be done with. If you can't write it, tell it to some of the children. On page 26 of January No., friend Miller has told you just what form to put it in, and there are only six items. Please, now, don't drop it, but do it this minute, and then you will have a clear conscience for the rest of the day.

#### ARTIFICIAL SHADE; SUNFLOWERS.

In the spring, in my hot-bed I plant sunflower seeds. When up about 8 or 10 inches high, I transplant around my hives, leaving a passage behind to work the hives. This succeeds well. The flowers are grown up when the hot weather sets in, and makes a splendid shade, and it screens the operator when working with the combs. Sunflowers furnish pollen and honey; bees worked hard on them all the time they were in bloom, and when ripe they furnished a lot of feed for my fancy chickens, so they are very profitable.

WM. HARTRY.

Brussels, Ont., Can., Dec. 18, 1882.

#### HOW TWO QUEENS FOOLED ME; THOSE AWFUL HYBRIDS ONCE MORE.

The most of my queens last summer were three years old; and during the swarming season the most of them were superseded, and a good many hybrids were raised in place. During the honey harvest I had no time to raise queens to replace them, but let them go thus till I had more time. When extracting I would put the empty combs of one hive in place of full ones taken out of another, as other people do, I suppose, and by this means I got hybrids mixed through all my pure colonies, for the queens, for want of room below, would lay eggs up stairs in the empty combs before the bees could get them full of honey. I had three colonies that I will call A, B, and C, that I thought I would breed from, because their bees were a little finer marked than the others. After the harvest I went to raising queens, to Italianize up again; but a good part of my young queens would still be hybrids. So I kept raising and introducing till October, and I then had 6 or 7 hybrids still. Then I took the queen out of colony A, and thought I would raise a fine lot of cells, and close out for the season. Some days after, I looked to see how many queen-cells were started, but found none, but plenty of eggs. So I found another queen in there doing duty that had probably been raised from that hybrid brood put in. I now began to scratch my head, and could begin to see why so many of my queens proved to be hybrids. I then went to hive B, opened it and examined it closely, found they had raised a "new" queen, and the hybrid bees hatching out by the thousand. This opened my eyes fully. I am almost ashamed to tell this, but it is really a fact. Now, I have always thought that I was more particular and more guarded than a great many men lest I might commit mistakes; yet in this instance I have been completely fooled by two queens. S. C. FOX.

Maysfield, Milam Co., Tex., Jan. 9, 1883.

Friend F., your mishap may not be altogether "fooling," after all. Several facts recently given seem to indicate that brood taken from one hive and put into another will often result in an extra queen, and, of course, from the brood put in. Had you put pure brood into a hybrid hive, you would have had it the other way. Do you see?

#### ABSCONDING SWARMS; HOW FRIEND SHEPARD STOPS THEM.

I see so much said in GLEANINGS, and especially in the JUVENILE, of late, about bees "running away," "going to the woods," etc., I thought I would give your readers my plan for stopping all these runaways. I will just say, I have tested this plan for over ten years in an apiary of from 80 to 150 colonies, and have not in that time lost a swarm, though many have tried hard to go. My plan is this: After hiving a swarm (my bees never try to go off till they alight), if they start to come out again, when a few, about a quart, perhaps, have left the hive, I stop it up, keeping the rest of the swarm for about a minute; then I open it, letting out about a quart more. This confuses those that are out, as there are not enough to go to the woods, and they soon begin to come back to the hive they came from. As soon as I see this I open the hive; then there is a rushing-out and going-in for a few minutes, when they all go into the hive again. If they try it again, I serve them in the same way, when they soon give it up

and go to work. I have had them try to go as many as four times, but I always conquer them. Now, how many of your young bee-keepers will try this plan and save their bees? N. N. SHEPARD.

Cochran, Pa., Jan. 22, 1883.

While it seems quite likely that some such disturbance would upset their plans for de-camping, it seems to me it will be quite a difficult matter to be on hand at just the minute they may start, as they come often at any time of day, almost, and without note or warning. We are, however, much obliged to friend S. for the idea, as it will enable us to know how to act when we are on hand.

#### SUBSTITUTE FOR ENAMELED CLOTH.

Several years ago a bee-keeper in Los Angeles Co., whose name I have forgotten, showed me a kind of cloth which he used on his hives. It was some thin, white cotton cloth which had been dipped in a mixture of melted beeswax, lard (or tallow, I forget which), and other ingredients, which he did not know, having obtained the cloth from somebody else. The cloth was cut from a whole bolt into a long strip, the right width for the hives, and was then passed under a roller down into the hot mixture, so that the cloth was thoroughly impregnated with it. After cooling off it was wound upon a round stick, which kept it smooth, and from which pieces could be cut, when desired. The cloths on the hives were all lying smooth and even, not a hole in any of them, and no wax or propolis attached to the under side. The frames came up even with the top of the hive. He would take hold of one corner of a cloth, and peel it back to look at the bees; and when replaced, the cloth lay as smooth and even before. They stuck fast just enough to prevent the wind from blowing them off, if the cover was off. Now, here you have something to experiment on, and perhaps you can, with these incomplete directions, hit on something that will be better than enameled or any other kind of cloth.

#### ANOTHER WAY OF BINDING PERIODICALS.

The way I have been doing it is this: Lay all the numbers of a volume in their order on the edge of a table, with their backs to you. Make the backs all come even and straight with each other. Then clamp them together with a carpenter's hand-screw (two might be better). Now with a long awl pierce them one inch from the upper end and lower edge, and  $\frac{1}{4}$  inch from the back. Again pierce them one inch inside the other holes. Then with a long slim darning-needle bring a double linen thread twice through each pair of holes; draw the thread tight, and tie it securely. This will hold them well, although it may not be as good as T. J. Cook's plan, but easier done.

#### SMOKE FOR RELIEVING PAIN.

The smoke of burning brown sugar is such an old, well-known remedy, that I wonder you should disbelieve its effect. I also often smoke my hands with the bee-smoker when bees are "bad," although never using any thing now.

WM. MUTR-RASMUSSEN.

Independence, Inyo Co., Cal., Jan. 14, 1883.

#### FROM 5 TO 51 IN 2 YEARS, AND 1400 LBS. OF HONEY.

I began the season of 1881 with 5 colonies of blacks, and increased to 23. The spring of 1882 found me with 18 colonies, after losses by queenlessness and robbing were over. From these we have taken about 1400 lbs. of extracted honey, and increased to

51, nuclei and all. We fed 150 lbs. of sugar for winter stores. With the exception of this and a few pounds of basswood, their winter stores are almost entirely goldenrod honey.

#### HYBRIDS, AGAIN.

The colony that gave the largest yield was hybrid, an Italian mated with a black drone. They were far gentler than any of my pure Italians.

EDGAR HUSBAND.

Cairngorm, Ont., Can., Dec. 28, 1882.

My report for 1882 is as follows: Thirteen colonies, spring count, 5 of which were transferred from log and box hives; amount of honey, 812 lbs., of which one-third was comb honey; 62½ lbs. per colony, and increased to 80, or 131.

#### WINTERING QUEENLESS COLONIES.

From one swarm I sold the queen the 6th of Aug., and inserted a cell about to hatch, which they tore down; then I gave them eggs from a tested Italian queen. They raised a queen, and she was lost; so the last of September, when I prepared for winter, they were without any young bees or brood to commence winter with. What would you have done with the swarm, under these circumstances? I brimstoned them. Which degree of murder was it, — first, second, or third?

#### CANDYING OF HONEY.

We have tried to have our honey candy, and have sometimes failed, although it was set in a cool room in open jars, with the temperature hardly ever above freezing (it was very nice white-clover and goldenrod honey, thoroughly ripened). Last winter I mixed a little water with it, and then it partially candied; but this year it has candied perfectly.

#### GIVING UNSEALED BROOD TO A NEW SWARM.

You say, "Give the new swarm a card of unsealed brood." I have done so, and find that the brood must be put in the hive before the swarm is, or they will be very apt to swarm out and leave the brood. Every one I gave a card to swarmed out soon after they were hived. When a swarm is hived they should be left as quiet as possible, with plenty of air, or they will be roasted out; and be sure to have the frame in place, or they may build their comb in bad shape.

#### A SMART QUEEN.

A hive swarmed, having a virgin queen; and wishing to return the swarm, and knowing they had another cell about to hatch, I took out the card containing the cell, and stood it against a tree, three feet or more from the hive. In a few minutes, and before the swarm was all clustered, we saw a queen on the edge of the hive next the card. We then looked at the cell, and found the cell empty, as she had flown back. I think she flew, as the ground was grassy, and would have taken a longer time to have crawled. We had a queen hatch on the fourteenth day, and I don't want any more, as the bees then began to tear down the cells. I think I should prefer the Holy-Lands to raise queen-cells.

D. M. TORREY.

Shiocton, Outagamie Co., Wis., Jan. 15, 1883.

I think it was murder in a very bad degree, certainly, friend T. If there were plenty of bees, they would have wintered all right, and you could certainly have given them some sort of a queen.—I am glad to know that you have demonstrated that thin honey will, at least sometimes, candy sooner than thick: but I wouldn't like to have it said I

was in the habit of putting water in my honey, even if it did make it candy.—It may be that it makes a difference whether the bees be given to the comb, or the comb of larvæ be given to the bees; but I should be inclined to think your experiment was accidental, until the matter is verified by further experiments.—The young queen may have flown from the comb, as you suggest; but as second swarms often have several young queens, I should not be surprised if one had escaped your notice.

#### CALIFORNIA HONEY ON THE RISE.

As we buy quite a little honey of friend Wilkin, we wrote him a short time ago to know what he could let us have some more for. The following is his reply:—

It is almost impossible to get any such honey in California now. I sent 30,000 lbs. to Liverpool in September, and have received an order for about 70,000 lbs. more; but as the quality is not what I like, I shall furnish only a small portion of that amount. I send you a sample of what I have on hand; and if it suits you I will deliver it to you at Medina at 12½ cents, in lots of six cases or more. R. WILKIN.

San Buenaventura, Cal., Dec. 26, 1882.

The above looks a little more like making it a paying business than it did a few years ago. I presume our Pacific friends are now only waiting for another flood of honey, such as they used to have a few years ago.

#### FROM 29 TO 90, AND 4000 LBS. OF HONEY.

Last spring was very poor for bees; so Edmund Pickup fed about 50¢ worth per hive in bee candy, sugar, and honey. In the fall he got a little over 4000 lbs. of comb honey; an average of 138 lbs., spring count, and increased from 29 colonies to 90, besides six swarms otherwise used, and eight got away. More than one-half were black bees. The best colony in spring produced 236½ lbs., and three swarms; the best old stand, 99¼ lbs., besides one swarm. From the best new swarm, 122¼ lbs.; from the best 2d swarm, 68 lbs.; from the best third swarm, 27 lbs.; the best 4th swarm, 29½ lbs. Honey at 15¢ per lb., and new colonies at five dollars each give a net compensation of \$30.50 per hive in spring. John, brother of Edmund, has an interest in the bees; so the Pickup brothers show great skill and industry in raising them. Yesterday Edmund gave to the Limerick church 666½ lbs. of honey — one hundred dollars' worth — for an endowment fund. This is a praiseworthy act of Mr. Pickup, and will live after him. Besides the above, we understand he has given 34 lbs. to preacher's salary, and 100 lbs. for church repairs.

RUTH.

Friend Pickup, of Limerick, Ill., tells us the above was written by the minister's wife, for the county paper.

#### LARGE STORIES.

Do you not think some of those bee-keepers out your way tell some pretty big stories sometimes? I believe if there is so much honey out there it will be coming down here in a flood some time. What do you think? Some say they can dip it up with a teaspoon; some say they get all covered with honey from wheat-stubble, so they can't hardly work. It is too bad, but I can't help it. I guess they will get through. Don't you think so? I did very well this year with my bees. I had six swarms last spring. I

now have 13, nice and strong; one swarm of hybrids, very ugly.

FRANCIS C. SMITH.

Kilmanagh, Huron Co., Mich., Dec. 22, 1882.

Why, friend S., I have no reason to think any of the reports sent in are untruthful. In the first place, they do not come from any one locality, but are, as you see, scattered far and wide. And again, if you observe, the letters read as if they came from good, candid, hard-working men, who would have no object in making exaggerations. I agree with you, that it is indeed wonderful; but when it comes from "the mouths of many witnesses," it would not only be unreasonable, but unkind and unchristian like, to disbelieve it. You are a Christian, aren't you, friend S.?

A REMARKABLE YIELD OF HONEY; FROM 47 TO 64,  
AND 247 LBS. OF HONEY TO THE HIVE, ON  
AN AVERAGE.

Mr. James H. Cox, of Hudson, Ill., informs me that he started last spring with 47 hives of bees, and increased to 64 in the fall; but he sold several colonies during the summer. He took during the season something over 11,000 lbs., of which 4000 lbs. was comb honey. I do not remember the exact number of pounds, but the average on the 47 hives was about 247 pounds.

A TROUBLE WITH TWO-STORY HIVES.

I have had some inconvenience with these hives. It frequently happens, that at the end of the honey season the upper story will be full while the lower story will be nearly or altogether empty. Is there any way to prevent this, except by changing the combs? I can readily see that the Simplicity hives would be quite handy in such cases, as it would not be difficult to exchange stories.

Decatur, Ill., Jan. 19, 1883.

E. A. GASTMAN.

Particular stocks seem to have a fashion of always going to the top with their honey. This is oftentimes the case with hybrids or black bees, I believe, Italians having a fashion of keeping their stores down, and refusing to go up into another story, if they can avoid it. Where one has all the boxes above, and wants to get comb honey, the trait may be a valuable one; but in that case they must be carefully looked to and fed up for winter, if they require it. Setting the combs and brood below is perhaps the readiest remedy, friend G.

FROM 15 TO 36, AND 1462 LBS. OF COMB HONEY.

As every one else is sending in reports, I guess I must send in mine too. I started, last spring, with 14 hives; bought one of you, making 15. Increased to 36. Only one, that I know of, left for parts unknown last summer; and last fall, while putting them into winter quarters, I came across one hive with 15 or 20 bees in, but full of honey. I sold 1462 lbs. of honey; got 20 cts. for the most of it; amounted to \$286.69. I have between 300 and 400 lbs. to sell yet. I laid aside 100 lbs. for my own use; have about 80 frames of nice honey that I took out to put the cushions in.

J. A. KENNEDY.

Per *Louisa*.

That is doing pretty well for a man 74 years old, is it not? I help father with his bees. I can hold the smoker, you know, if nothing else.

L. K.

Farmingdale, Ill., Jan. 20, 1883.

Whew! that last remark savors a little of

JUVENILE GLEANINGS. I shall have to confess, *Louisa*, that I was wondering, as I read, how a man 74 years old could write so nicely. It seems, then, that you not only hold the smoker, but you write letters, and save your poor old father's eyes, and make Uncle Amos glad, to see you have done it so nicely, as well as so kindly. Well, well, perhaps the time may come when we shan't know young GLEANINGS from old GLEANINGS. Who knows? Oh, yes! Who can explain that hive full of honey, with only 14 or 15 bees in it? Let the children tell how it came about.

HALF-POUND SECTIONS; A FAVORABLE REPORT.

Can you arrange your machine to make the  $\frac{1}{2}$ -lb. section, size about  $3\frac{1}{2} \times 2\frac{1}{2}$ ? We have been using  $\frac{1}{2}$ -lb. sections to a limited extent since 1878, and find them very profitable, if put on the hives properly, and the right care taken of them after they are put on. We will say further, that we have used them of all sizes, and with and without separators, and think that we have about the right size, and that we can not use them without separators.

Peoria, N. Y., Dec. 28, '82. J. C. NEWMAN & SON.

Inasmuch as the above is the first favorable report of these from one who has used them, we are very glad to get it. We have now our machinery arranged for making sections as small as the above, and are only waiting to have it decided what dimensions are to be called for most, before we keep them in stock and fix a price on them.

NICKEL INSTEAD OF ZINC.

I see on p. 626, GLEANINGS for Dec., an article on galvanized honey-gates. Allow me to suggest nickel-plating them.

KEEPING BEES INDOORS.

I am trying an experiment which may be of interest to bee-keepers. It is, keeping bees in the house in winter. A neighbor, an old-fashioned bee-keeper, was going to take up some bees, so I told him I would take up the honey for the bees; he was greatly astonished to think that the bees were worth any thing, but said I was welcome to them. So on Thanksgiving day I took them and brought them home. I had very unwisely sold all my surplus honey, so had nothing on which to feed them. I knew they would have to have some liquid in order to take up any candy, and I had no convenient way to give them any, so was at a loss to know what to do. At last it popped into my head to try keeping them in the house. As they cost me nothing, I knew that I should lose but little if I lost them. I made a cage the same size as a Simplicity hive, and covered it with wire cloth. I put a Simplicity feeder inside, and then put my hive on to the cage. I have fed them thus far about 5 lbs. of syrup. I find the best proportion for syrup to be 1 lb. of sugar and 1 lb. of water. At this date they have drawn out a large piece of fdn., and built some new comb on their own hook, in two empty frames; they have filled most of it with syrup, and capped part of it over. I am now trying to get them to raise brood.

A. C. MILLER.

Barrington, Bristol Co., R. I., Dec. 30, 1882.

I think nickel plate would do nicely, friend M., but you know that would be a little bordering on the aristocratic, which would not matter so very much, if it were

not for the expense.—I am always interested in experiments in regard to keeping bees indoors, because it seems, from the success that has been many times made with single colonies, that there certainly is something here we are not yet familiar with; and when we can once manage to build any colony up in midwinter, our wintering troubles are surely over.

## Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

I HAVE the worst luck, and the most of it, of anybody. I began last spring with one mothy stand of bees; they swarmed three times — one good, one fair, one small. The first did well; the next made enough to live on till winter; but when the moth was about to get the best of them I put them with my last swarm. The old stand which I transferred in November, died with plenty of honey. I don't think they had any queen, for I never saw as many drones in my life in one stand at one time. I am satisfied I killed half a gallon of them when I transferred them; that was after they had done swarming. Now to-day, the one that I doubled is dead too. They had plenty of honey, all sealed at that; also pollen. It was not honey-dew honey, for they had not eaten any of it. It was sugar syrup that they had lived on all fall. I have read your A B C, but can't find any thing to correspond with my case. Now, what is the matter with them? If you know, will you answer through GLEANINGS? But, don't put me in Blasted Hopes yet.

### HONEY-DEW.

How many bugs do you suppose it would take to make a gallon of honey? The woods were one shining sheet for a month or more with it. It seems impossible that aphides could produce such quantities of honey.

JAMES T. SWAN.

Smithville, Clay Co., Mo., Jan. 18, 1883.

Well, really, Friend S., I don't know where else to put you, after you say you have had the worst luck, and the most of it, of anybody. If, with the A B C before you, you have let those bees go on raising drones until you killed half a gallon at one time, it seems to me there hasn't been any bad luck about it at all, if you will excuse me. Why did you not look into the hive, and see if they had a queen, instead of letting things run on in that way? Had you not spoken of transferring we might think you had them in a box hive; but why one should let things go on thus, when their bees were transferred, is more than I can imagine. If the woods were shining with honey-dew, I am inclined to think this may have had something to do with the other one dying; but it wasn't the honey-dew that caused them to rear drones by the gallon, sure. The matter was, friend S., that you didn't look to your bees enough to know whether they had queens, or were rearing useless drones. All the books and all the bees wouldn't help one who neglects so simple a matter as this. Can't we look for you next in Reports Encouraging, friend S.? If your one hive swarmed three times, your locality is certainly not a bad one.

## Notes and Queries.

### BEE-STINGS FOR NEURALGIA.

I AM, and have been, a great sufferer from neuralgia, and it is with much effort that I have written. I am a firm believer in the efficacy of bee-stings to remove this disease, and I long for the time to come when I can again live and work among the bees.

MARY SMITH.

Plattsburgh, N. Y., Dec. 28, 1882.

Bees are all O. K.; am using Quinby hive; commenced with 2 colonies in the spring of 1882, and increased to 9.

W. E. POTTS.

Edna, Kans., Jan. 17, 1883.

### FROM 9 TO 19, AND 700 LBS. OF HONEY.

Spring count, 9; increased to 19; 700 lbs. of honey; bees nicely prepared for winter, in chaff hives.

D. J. SPENCER.

Vernon, Trumbull Co., O., Dec. 23, 1882.

### FIFTEEN FROM ONE; WHAT DO YOU SAY TO THAT, FRIENDS?

I have got the biggest increase of bees from one swarm in the State—15 swarms from a May swarm, 1882.

BENJAMIN MORRIS.

Spencer, Ind., Jan. 15, 1883.

[Tell us more about it, friend Morris.]

### FROM 12 TO 31, AND 1200 LBS. OF HONEY.

I had 12 swarms of bees in the spring of 1882, from which I got 900 lbs. of section honey, and 312 lbs. extracted, and 19 surplus swarms, which made 31 swarms to commence the winter with, all in good shape. How is that for 12 swarms?

Jefferson, O., Jan. 22, 1883.

J. E. RUGGLES.

### THE FIRST HONEY REPORT FOR 1883.

There is not much honey coming in at present, but any quantity of pollen, and I am raising queens from the dollar queens received from you last summer, I followed friend Cook's plan. From one swarm I have drones, and from two others I have 26 queens, cells capped.

G. DELONO.

Key West, Fla., Jan. 11, 1883.

### FLORIDA; NEW HONEY.

I left my home in Ohio the 27th of last November; have had some quite cool weather for Florida this winter. Thermometer in the shade to-day, 79°. Bees are flying almost every day, carrying in pollen and some honey. It would be quite a good place here for bees, but not as good as on the coast, for there are no mangroves here.

C. F. HOPKINS.

Orange City, Fla., Jan. 17, 1883.

### STANDING L. FRAMES ON END FOR WINTER.

I guess the 8x17 Langstroth hive is not just right to winter bees in. Those L. hives that came through all right, the owner had stood up on the nose, or front, raising the rear of hive about 45 degrees, packing the outside with straw, showing, to my mind, that the 8x17 frame is not right for this part of the country.

J. W. TAFFT.

Buffalo, N. Y., Jan. 20, 1883.

[The above came to hand after our article on p. 79. While it shows that this man wintered his, and others around him did not, it does not necessarily follow that it was because the hives were stood on their "noses," as our friend quaintly expresses it.]

I commenced with one swarm last spring. I have three now, and I got 300 lbs. of honey.

ALBERT UNSWORTH.

Sandusky, Sanilac Co., Mich., Jan. 5, 1883.

My bees did well last summer. I had 39 in spring, and 64 now. I got a little over 6000 lbs. of extracted honey. I have 40 in chaff hives, and 26 in bee-house. Cedarburg, Wis., Jan. 9, 1883.

F. BEHRENS.

I started last spring with 18 swarms of bees; increased to 52, and have taken out during the summer 1100 lbs. of section honey, mostly all white clover.

H. K. WOOD.

Rives Junction, Mich., Jan. 15, 1883.

I have horsemint growing all over my place; it makes lots of honey, but it's strong. In the woods we have hawthorn, elm, osage orange, and pepperwood; honey from the last named is too hot to eat.

M. A. LUCKEY.

Ladonia, Fannin Co., Tex., Jan. 4, 1883.

Started in the spring with 11—three poor and eight strong colonies. I increased to 31, and gave me nearly 400 lbs. of surplus. In the fall I sold 3, and 27 I have packed with chaff on their summer stands; 4 common and 23 extra good ones.

Manchester, Pa., Dec. 27, 1882. ALBERT HAKE.

I had 17 swarms of bees in the spring; have now thirty, with 2100 lbs. of surplus honey, and enough in hives for winter, and 20 lbs. of beeswax. I sell extracted honey at 12½ cts. per lb.; comb in section boxes, 15 cts. I think I shall have it all sold in time for next year's crop, and not go outside of Iowa Co.

Ladora, Ia., Dec. 12, 1882. J. N. SHEDENHELM.

I have realized \$104.50 from bees, honey, and queens, and have 22 stands, all in good shape. All the labor with them did not exceed ten days. How will that do?

W. H. FERGUSON.

Bloomdale, Ohio, Dec. 26, 1882.

[Few things would do better, I should say, friend Ferguson.]

#### FLORIDA.

Here I am, away down in Florida, the land of flowers and perpetual summer, or nearly so. I am looking up the bee business here; but at this time the bees are not doing much. I left all my bees at the North, packed snugly in chaff, while I am wandering about Florida. I hear from home that the winter is a genuine old hard one so far. The climate here is very fine, and has been since I came here four weeks ago.

FRANK MOSS.

De Land, Fla., Dec. 19, 1882.

#### HOPES NOT "BLASTED."

I lost all my bees two years ago this winter—between 60 and 70 swarms, but I didn't give up. I looked around and found others about the same as myself; couldn't buy any in the fall; went into the woods and found 3 swarms; got them home, fed them some, got them through the winter all right, and last summer I increased them to 19 swarms, and had all the honey we wanted, and sold about \$21.00 worth. I have plenty for the bees.

Edgerton, Wis., Jan. 6, 1883. R. H. PHELPS.

#### TWO QUEENS IN A HIVE.

One of my hives had two queens for sixteen days. (I don't know how much longer they would have stayed together if I had not separated them.) They were mother and daughter; the mother is this year's queen, got of E. M. Hayhurst; she is good and pro-

lific. I don't think she was being superseded; do you?

JAS. J. CHURCH.

Waterford, Ont., Can., Dec. 21, 1882.

[Not necessarily; such cases are more common than most people are aware of.]

#### MAKING FDN. ETC.

The foundation-mill that I got of you last summer gives good satisfaction. Would you please tell me, in a few words, how to get the fdn. dry?

JACOB SILLS.

Cedarville, Stephenson Co., Ill., Dec. 15, 1882.

[If you use starch as a lubricator, friend S., your fdn. will be dry as it is made, or nearly so. As the rolls press the starch out of the way as the wax passes through, we cut it up and box it immediately, or put it into frames to use in the hives, as it is wanted.]

## The "Growlery."

This department is to be kept for the benefit of those who are dissatisfied; and when anything is amiss, I hope you will "talk right out." As a rule, we will omit names and addresses, to avoid being too personal.

**G**LEANINGS has been rather flat for some time. Surely there is a large field open to you in the scientific part of bee culture. Would not your own experiments pay—e. g., the weighing of bees, their honey-carrying capacity; wax produced from pure sugar, both grape and cane, and a dozen other interesting matters? Your own apary reports on wintering, etc., were very interesting, but you don't seem to have thought so, as these columns have nearly dwindled to nothing. Make thorough experiments on a large scale, such as those boys played at with their toy scales, and readers will be attracted to GLEANINGS. Wishing you success in all your enterprises, I remain,—

J. H. ELDRIDGE.

Earlham Rd., Norwich, Eng., Dec. 13, 1882.

Well, I declare, friend E., I have had many kind words for GLEANINGS, and our friends across the water have been usually most profuse in their words of encouragement; but I don't know that I ever before heard anybody call GLEANINGS "flat." It can't be you said it on purpose to hurt me, did you? I might feel a trifle hurt, were it not for the large favor with which our journal is now welcomed wherever the English language is spoken; and as it is, I will try to think it is always our best friends who tell us our faults, and so remember you as a little nearer than the majority of them. I know your point is a good one. I know how welcome are any items of my own practical experiments with bees, buckwheat, honey-plants, and the like; but with this whirlpool of business and letters to be read, I really don't know how I can do any better. May be when the college boys get home and take up some of this editorial work I shall do better. Meanwhile I thank you, and I will keep it in mind that one friend has thought GLEANINGS flat, and that I must studiously try to avoid "flatness." Wouldn't you, friend E.? I don't know now that this properly belongs in the Growlery; but I didn't find any thing any better, and the department ought to be kept up, you know.

## Our Homes.

Though he slay me, yet will I trust in him.—Job 13:15.

**M**Y friends, I have a sad story to tell you to-day, and yet out of its very sadness I trust we may find a useful lesson. You have heard me speak of our Canadian boys, and have doubtless known that one of them has had charge of the apiary principally, for the past two years. He came here to learn bee culture, while his brother, older, remained to care for the bees at home in Canada. It is of this one that I would speak. Some of you may remember a bright, hopeful letter that he wrote in our Sept. No., 1881. If you have the number handy, it may be worth your while to turn to page 424. At the close of his letter we find these words:—

Now, friend Root, I can hear you say, "Very good, friend C.; but, go carefully; go slowly at first till you get experience." I promise you I will be careful, for I guess I know what care it has taken to put that little apiary in its present shape; yes, to build it up from nothing in six months; but to go slowly, never! I have a great many faithful advisers on this point, and I would say to all such who may read these lines, that, with all due respect for your good wishes and greater experience, "Please before you say further, come right here and step into my shoes." I have lived a quiet country life on my father's farm for twenty years; but that life is at an end now, and time is precious; time is money, education, influence, every thing, and time is short.

There is nothing especially peculiar in the above, and the feeling he expresses there might be shared by many a young man of twenty; but, as nearly as we can well decide now, it appears that that letter was written when he was on the eve of insanity. A few weeks later his brother became so alarmed at the strange tone of his letters, that he showed them to me, and finally, by my advice, he went back to Canada and brought the writer, A. E. Calvert, here. We thought if we could get him here among our boys and girls we might, with God's help, lift him out of the despondency into which he seemed settling. For a time we seemed to partly succeed, and he took hold of our work, and was apparently one of us; but toward spring he seemed to settle back, and finally wrote a letter to John, who brought it to me. The letter was one of the saddest accounts of struggles with despondency and despair that one could well imagine. I saw him alone with his brother, and had a long talk with him about it. He insisted that his mind was gone, and that it was too late for him to be helped. He thought if he had come among us sooner, perhaps he might have been helped out of his trouble; but he continually insisted that it was too late. He said in his letter that he thanked his shop-mates for the courteous way in which they treated him, but that they did it only out of kindness and politeness, for it must be apparent to everybody, as well as himself, that he had not ordinary intelligence. I told him, it was only a monomania he had fallen into, and that his powers of mind were unimpaired, and no one thought of such a thing. I plead and argued the matter with him, and took him by his great

broad shoulders and told him he had strength of mind, and body too, to do a world of good in encouraging and cheering others, instead of settling down to brood over imaginary evils. I scolded him for giving way to temptation, and, with his consent, burned the letter and got a partial promise from him that he would not yield again to temptation, so far as to write any more in that strain; and before I left him he knelt in prayer and asked God to help him to overcome the temptation to yield to these evil thoughts, and to deliver him from the dark cloud that threatened to envelop his whole life, and to give him faith to say, "Thy will, not mine, be done." From that night on he seemed to begin to rise up; but as a further precaution I asked him to come up into my room every Wednesday evening, and tell me of his temptations, and we would, with God's help, surely bring him out all right. These meetings were kept up for many weeks, or until I felt he was in comparative safety. As I noticed still that he had a fashion of relapsing into a sort of gloom, or reading in a sort of mechanical way, hour after hour, John and I thought it would be well to give him some work to occupy his mind; and accordingly he was employed for several months in filling orders for goods that were to go by express. After the busy season was over he helped in building our new house; and toward fall I was rejoiced to know that both of the boys had decided to go back with Ernest to Oberlin to school. It seemed to me that Oberlin was the place of all places to get one to feel that life is worth living for, even for those in humble circumstances. He took hold of his studies well, learned easily, and made unusual progress; and when he came home at the holiday vacation I inwardly thanked God that Albert had been, so far as I could see, raised from the dreaded fate that seemed at one time to hang over him. Even though he seemed so safe, I determined to have, at the first opportunity, a good long talk with him in regard to his old malady, and find out whether he had been subject to his old despondent moods any more. I once went over to his room in the new house, for this express purpose; but as he was busy talking with others, I let it pass. No opportunity offered, and the day came for them to go back to college. For a trifling reason they neglected to take the morning train, and so the boys were sitting around through the day, not doing much of any thing. It was almost train time, and we were taking supper rather earlier in the lunch-room, that the boys might not be late for the train. Albert had been around within an hour, so we sat down without him. After we had partly finished our meal, I remarked,—

"Why, it seems strange that Albert should be away so long, when it is so near train time."

The others made some comment, and Jacob remarked that he saw him a little while before, going into the house apiary. John arose hastily and went out; but if I saw it, I thought nothing of it. In a few moments more I was startled and stunned by the sud-

den appearance of John's white face, which came before me as a dream. I presume it was the words that stunned me, for I could hardly tell whether I really heard them, or whether it was a freak of my imagination. The words were something like this:—

“O Mr. Root! Albert has shot himself, out in the house apiary.”

As soon as he said it he was gone again. He spoke so low that few heard him; and as I passed through the hands in the packing-room, I almost envied their ignorance of the great sorrow that lay upon us. One of them was scolding pleasantly because so many kept leaving the west door open. Soon work was stopped, and sad groups were scattered through the apiary, and over the factory.

He had been well liked by the hands, for, indeed, it were a pretty hard matter to find any thing against him. Many had noticed his gloomy spells, but the greater part of them knew nothing of the insanity that hung over him, unless it was the near friends or his brothers. Now little incidents began to come up, related by one and another, and things about him we could not understand before, now began to be explained. Was he crazy? did he deliberate this act in his sane moments? we all began to inquire within ourselves, if not out loud.

When he commenced shipping goods last summer I required him to bring all to me, to inspect, before he did them up. Well, after he got used to the business he thought this unnecessary, and sometimes sent them off without my inspection. At one time the clerks began to complain that some one meddled with their goods, after they were inspected, ready to pack. I could hardly believe they were not mistaken, until some one told me he saw Albert take a smoker from another man's goods, and use it to fill an order of his own. I took him one side, and asked him about it. He neither acknowledged nor denied it. I became somewhat vexed with him, and talked pretty severely. This seemed to arouse him.

“Mr. Root, do you think I would do any thing dishonest?”

“Why, no, Albert; I can not well call it dishonesty, for there was no motive for it, or no selfish one; but will you please tell me why you did take a smoker out of that box?”

Now he spoke full and free. “Why, Mr. Root, I can not tell why I did it. If they saw me do it, I suppose I must have taken it; but I have no recollection of ever having done such a thing at all.”

He promised to be careful in the future, and I let it pass; but now it looks plain that there were times when he did not know what he was doing. May it not have been at such a time when he did this awful deed, and that he was in no way responsible for it? No letter was left (for I had exacted from him a promise to write no more, for it seemed to me to hurt him to dwell on it and write letters), and it would seem that none but God, who reads the human heart, will ever know the secret of that hour.

I have told my sad story, friends, and I have told it as fairly as I know how; and the saddest part of it is, that it is true there

is a phase of humanity, a disease, if you choose, that attacks men and hurries them on to deeds like these. I have studied insanity quite a little, both among friends whom I knew, and among the poor unfortunates whom I have met in our Sunday service at our county Infirmary. I confess that few things in life have had such a tendency to cast me down, and to almost tempt me to doubt God's kind loving care, as these cases of insanity and suicide. Sickness and death do not appall me, because the suffering one may hold on to God's great promises, and rest even amid the most excruciating pains, trustingly in his arms.

While enveloped in the sadness and gloom of this event, all at once the idea occurred to me, suppose Albert had died a natural death of sickness, or by accident. My heart almost bounded at the thought. Oh how gladly would we have seen him die thus, in preference to such a death! And yet, why? Proofs of his occasional insanity were many and satisfying; why, then, should we repine, and indulge in useless regrets that we did not do something more for him?

Again: The Bible says, “Come unto me, all ye that are weary and heavy laden.” Does this apply only to sane people? Are the comforts and sustaining powers of religion for the diseased in body, and not for those diseased in mind? Our departed friend was a professor of religion; he prayed God to help him in his great trouble, as I have told you; and he rose up and spoke in our young people's prayer-meeting, only a little more than a week before his death. How can it be? and why did God, in his wise providence, allow such a thing to happen? or, why should such things as suicides be known in this world of ours?

I am pretty sure there are some among my readers who will feel like reproving me for having written the above—who will say that it is wrong and wicked to even question God's loving-kindness for a single moment. I agree with you it is wicked, and I soon knew it was wrong for me to let such thoughts force themselves upon my mind. I prayed for light, and I am glad to say that light did come. It came in the line of our opening text. Though he slay me, yet will I trust in him. Do you know who said that? As I thought of it, I began to see more clearly why the book that contains it was put in the Bible. It may be that it is only after having lived half a lifetime that we can feel the need of such a text, and thank God he put it there. Did it ever occur to you that the human mind is a wonderful piece of mechanism? The human will, too; who can understand or fathom it? The following may be helpful to somebody:

After the simple funeral services at the factory, John and his younger brother, Robert, took the body and went back to their northern home, while we took up the daily round of business once more. Some way I could not get to work as I usually do. Few things in life disturb me very much or very long while my trust is in God; but this event affected me differently from any other in all my experience. Every time I sat down to work, sooner or later the events of that day

would come up and stand before me. When I ought to be reading your kind letters, my thoughts would be drawn away; and, before I knew it, would be going over the details again. He was last seen by Jacob, opening some of the bee-hives, apparently looking to see how the bees wintered. Another saw him open the door and go into the honey-house. Then I tried to follow his thoughts. I tried to pry into the secrets God had so effectually cut off from us by that great solid wall of death. Instinct tells us many things that we should not know otherwise; and now, what does instinct, if that be the word, tell us of death? My powers of thought are now well matured. If ever I shall be capable of giving a wise opinion, if that be the word, of life, and its termination, death, now is the time I should be able to do it. The subject began to have a wonderful fascination. I lay awake nights to look on and wonder at the new phenomenon that began presenting itself. You know how I am given to hobbies, and to following one subject intensely until every single fact and feature is scanned. In a week I began to suffer. I knew it, and yet it began to seem as if I couldn't get away from it. I knew, too, that it was taking me away from God; and old experiences of battling with temptation became painfully familiar. I prayed; but even the act of praying about the matter brought it freshly to mind, and harmed me. Was it possible that I, who had lifted others and exhorted them to be strong in the Lord, was going to be found a poor weak mortal whom Satan could get before, so that he could not even pray? Was there a possible chance that I should go crazy too? Indeed, I am not sure that any one is proof against some of the phases of insanity, if he will let his mind run and dwell constantly on one theme. I made up my mind that I could and would stop thinking of any thing that had the most remote bearing on the subject, and I did; and then I thanked God that he had implanted in my nature the power of fleeing from evil. A good lesson comes in here. It is almost folly for any one to pray to God for deliverance while he continues to dally with sin. God helps those who are trying to help themselves. Nay, more; he has no pleasure in a half-hearted service. There may be circumstances where no other way than prayer is left open to us; but he who prays should look to it well, that no faint trace anywhere lurks in the heart, of any thing like a disposition to look on the sin he has renounced; no wanting to so much as even turn the head to look back; but keep your eye on God, and your faith, "though he slay me, yet will I trust in him."

A small little incident: Last September, when the boys went off to school, to save railroad fares, and also to keep their trunks from being smashed, as Ernest expressed it, Jacob carried them all overland, with our faithful old Jack and the one-horse wagon. Off they started in high glee, followed by prayers and blessings. On that sad night, after busy hurrying to and fro, I happened to come from town rather late in the evening, and in doing so I passed a horse and wagon in the darkness. I turned and looked

back. It was the self-same old wagon, and Ernest was driving. The wagon contained the corpse of his dead schoolmate and friend. It was the saddest event of his young life. While my mind was brooding over it in the days I have mentioned, I often thought of him, and wondered if he, so young, bore up under it better than I did, with my additional 22 years of age and experience. How short a time it seems since he was a toddling little chap with curly white hair! I remember that I wanted him to learn to walk, one day, but he didn't like to be hurried. He inherited from his mother some sturdy old English ways, and, unlike my enthusiastic Yankee way of wanting to hurry every thing along, he proposed to get a good ready, and plenty of strength, so that he might walk when the proper time came, and do it up right. Knowing him well, I employed a little strategy, to see if it was only because he lacked confidence, that he would not stand alone. I held a pictorial newspaper up before him, and got him to take it in his hands. When he was so absorbed in it that he forgot, I took my hands away from him, and left him standing alone, looking at the paper. I well remember how I laughed and shouted at the success of my experiment, and how he sat down when he looked around and saw I was not holding him. All along through these years we have been friends and companions, and it seemed on that sad night, as we talked the matter over, that he seemed more a friend, and nearer to me, than ever before. The drill of the college, and the companionship of good strong earnest men had been molding him to grapple with the stern, hard realities of life, and he seemed even in this matter to be steady and cool.

Well, in a few days a letter came. His experience had been almost exactly like mine. He had even given up one of his studies; and failing even then, he had gone to one of the strong old professors, and laid the case before him. He was told that, unless he took his mind right off from the matter, by force of will, it would not only be the ruin of his education, but the ruin of himself as well. He did it, and came out rejoicing, and praising God, as I had done. Am I wrong in thinking there is something in suicides, at least many of them, that can be guarded against by sheer force of will? Christians and humanitarians are now making it a study to find out how best to save valuable life from evils of whatever sort. What shall we do about the matter of suicides? At least half a dozen have occurred among those with whom I am personally acquainted, within my recollection. Is it a disease of the body, or disease of the mind? or are they so intimately connected that it is hard deciphering which? It has been said, that when one once undertakes such a thing, he never gives it up until, sooner or later, it is accomplished. I am glad to be able to say, such is not always the case. I recall to mind one friend who had got to such a stage of the disease that he would hunt the newspapers to find reports of suicides, and argued that one might commit the act, and still be a Christian and be saved. From

what I have told you, you can well see that the reports of our newspapers would be the worst thing such a person could possibly read. How was his life as a Christian at that time, do you ask? It was by no means in keeping with the sentiment of our opening text. But I am glad to tell you, that by the influence and prayers of kind friends he was made to see his error, and afterward died the death of a humble, patient, trusting Christian. Reader, when you see a friend die a quiet, happy, honest death, don't ever more repine. Bear in mind, there are other calamities sadder than this.

Let me tell you another little story. One who stands very high now as a scholar, and has plenty of offers of places with a salary up into the thousands, told me but a few days ago that he once passed through a very great trouble while in his studies at college, because his mind became affected in a queer way. He seemed, right while enjoying good bodily health, to lose the power of mental effort. In trying to describe the sensation, he said it seemed as if his brains had been "scooped out," and the cavity filled up with mud. The prospect before him of becoming an imbecile, and dragging out a weary life of say fifty years or more, in some infirmary or asylum, was more than he could stand, even if he was a Christian, and studying for the ministry. Any thing but such a fate, in place of the bright ambitions of youth. After a season of the worst real trouble he had ever known, and a long hard struggle to say, "Thy will, not mine, be done," he finally got down to where he could tell God he was willing to be an idiot all his life, if there was no way of averting it, and then he was saved. Feelings of joy and peace came instead of worry and despair, and this in itself was a wonderful help in the way of recovery, as any physician will readily understand. I tell you, my friends, rebellion against God is one of the worst sins a mortal can commit. This man gave up his studies, and, with the calmness of a little child, went home to work on the farm. In a short time he was back, and all right; but he had received a lesson that will last him through life, and he has been the greater man for having had this lesson. That vain ambition of his boyhood is gone, and, no matter how high he may rise now, he knows that it is all in God's hands.

He had been taught, by a very plain lesson, that it is not only the very breath we draw, but that even the very thoughts we think are in God's hands; without his permission we could not even think at all; but with his permission, we are permitted to choose between good and evil, and submission or rebellion. The will power lies in our hands, and it is in this that we are created in his own image.

Now, dear friends, when I speak of the dead, it is with reverence and respect; and in pointing out to you the moral of this sad lesson, I do it with a feeling that, if my friend Albert were present, he would tell me to do it for the sake of the youth yet living. By turning back to the extract in the opening of this talk, you will see he closes with these words:—

I have lived a quiet country life on my father's farm for twenty years; but that life is at an end now, and time is precious.

Beware, boys, how you ever let an idea creep into your mind that you are above the station wherein God has placed you. The young minister was rebellious at the thought of leaving his studies and going back on the farm; but when his rebellious feeling was put down, and he could say, Though he slay me, yet will I trust in him, there came a great flood of happiness in upon him, and he took a great step up toward God and heaven. I talked with Albert several times about this; but he insisted that if he ever did any thing in this world it must be something large. He once wished he was rich; but I told him that money left to him, that he had not worked and earned by hard labor, I should fear more than any thing that could possibly happen, to one like himself. He smiled at my strange ideas, and said he would like to try it.

I talked to him freely in regard to the matter of suicide, and told him, one evening, while we were alone, that one who should commit such an act was for ever lost; that, in the nature of things, he by the act gave himself into Satan's power. This, of course, could not apply to one not responsible. His reply was either evasive, or he made no reply. He seemed pleased with his work, and with his shopmates, and he rather enjoyed heavy muscular work. When the rest of the hands were carrying bags of seeds up stairs, one bag at a time, he would toss two bags on his shoulder, and march up stairs as though he enjoyed it. When he indulged in his gloomy moods it always seemed to drive him away from his religion, and there seemed to be with it a sort of rebellion against God. He seemed to be quite a way off from the spirit of "though he slay me, yet will I trust in him." His brother and I urged him to take part in our young people's meetings; but we did not succeed in getting him to do so until he went to Oberlin.

I believe his countrymen are, as a rule, noted for their energy and indomitable will. It is this energy and will that has hewn down forests, and tunneled through mountains; but the will must first be under proper subjection, and be taught obedience to proper authority, or it is like the fire that warms your homes; without restraint, it ends in death, instead of being a life-giving power. Albert had a will of his own; but I fear it was not a very submissive one, even when in his right mind. I told you he used to ship goods for us. After he had made a good many mistakes, I told him he must not send out any more, without bringing them to me to inspect. I soon found he let them go as before. When I remonstrated, he said he knew they were right, for he went over them several times. As mistakes were still reported, I finally told him he must not send out an article, until I had seen it. He kept on, and, when questioned, was stubborn and silent. I sat down and talked with him about it, made him smile, and made him talk. He gave as a reason for refusing to do as I wished, that, when it got so he could not put up goods without somebody to look

them over, he might as well quit doing any thing. I called in his brother, and went over the whole ground with him. I told him all our packers had their work inspected, and it might take him years to learn to avoid the mistakes always made by one inexperienced in any business. He said he would do as I said in any thing else, but would not this. Had it not been for his affliction, I should have had to let him go; but as it was, I concluded to give him some other work. As we dropped the matter, I told him I feared the position he there so stubbornly held to would be, in the end, his ruin. I told him I was obliged to obey orders from my customers, or it would cut off my own bread and butter, so that when we got so we refused to obey those we were working for, we were pretty sure to very soon refuse to obey God, and the end was Satan and eternal ruin. He smiled, and said something to the effect that he would take the chances. I believe that, as a rule, insanity is often accompanied with stubbornness. Perhaps it is beyond the power of man to tell which is the cause and which the effect in certain cases; but in any case, we can see clearly the importance of a humble and obedient spirit. A bee-friend once came to see me, whose mind, I was told, was affected at times. I was surprised to find him a man with most unusual powers and learning. I could see no trace of anything wrong on any subject. One day, when out in the open air, we got to discussing the respective merits of slates and queen-cards, to hang on the hives. I argued my side of the question until I saw he was getting stirred up about it, and thought it wisest to stop. I felt a little hurt, too, at the vehement way in which he objected to my opinions. All at once his manner changed, and he said, "Forgive me, friend Root; you are right, and I am wrong; and I am more wrong in allowing myself to get disturbed by so simple a matter. This is the trouble with my mind, and, dear friend, I beg of you, when you see me getting excited as I was just now, please lay your hand on my arm and bid me be careful."

The good old man preached us a most excellent sermon on the next Sabbath. He knew the weakness of his own afflicted mind, and yet, even out of that affliction he arose as one who "ruleth his own spirit." Truly, truly, the work is a greater one than that of one who "taketh a city."

Help us, O God our Father. Thou who knowest the hidden thoughts of us thy creatures, as well as all the secrets of the universe, to thee we come. Help us to realize our weakness, and help us submissively to acknowledge thy greatness. Help us, in pursuing the paths which thou hast lovingly made for us to walk in, not to forget that thou art supreme, and ruler over all. Help us to remember with thanksgiving and praise these lives thou hast given us, and keep us from all temptation to doubt or complain, when we meet with trials, or with experiences we can not understand. Help us to remember that thou, and thou alone, givest life, and none but thee hast right to take it away. Give us that reverent and trusting spirit that will say with thy

servant Job, "Though he slay me, yet will I trust in him."

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE OF READING MATTER.

**MEDINA, FEB. 1, 1883.**

Why art thou cast down, O my soul! and why art thou disquieted within me? hope in God: for I shall yet praise him, who is the health of my countenance, and my God.—Ps. 43:5.

We have now plenty of beeswax, but had to pay "right smart" for it. See what we now offer on page 54, cover.

Who has any spider-plant seed for sale, and what will they take for it? It seems funny if we can't get seed enough, as easily as this is to raise and gather.

OUR subscription list has gained, during the last month, about 1200 names, so we now have altogether 4832 subscribers. This number, thus early, indicates we shall go far above any former year. Thank you.

EXPRESS money-orders are proving a very sure and cheap way of sending money; but where you can, friends, please make ours payable to the Union Express Co., as that is the only express company we have.

IN referring to pages in GLEANINGS, the current volume may be understood where none is mentioned; otherwise the year will be given. Thus, "p. 425, 1881," can be as easily found as "p. 425, Sept. No., 1881." In ordering a number containing any particular article, the page, month, and year may be given.

OUR friend Horace Libby, of Lewiston, Me., sends us some beautiful plain drawings for a honey-house, that would do credit to any architect; but I am sorry he has taken so much time on it, before we really any of us know just what we want. I fear it is going to be something like our dwelling-houses. There are no two people in the world who want houses exactly alike.

IN our Jan. No. I advertised perforated zinc honey-boards at 25c each. I fixed the price after having imported my zinc, and paid all charges. After the journal had gone out I received a second claim for more duty on the zinc, claiming it was *manufactured* instead of *sheet* zinc. The difference on the quantity we imported amounted to more than a *hundred dollars*. In consequence of this I have been obliged to charge 30 cts. instead of 25, to cover the actual cost of the honey-boards. I dislike to advertise goods, and then ask for more; but under the circumstances it is the best I can do to save myself.

MANY of the engravings we give you in GLEANINGS are very expensive, and I have for some time been a little undecided as to what I ought to do about lending them. As all of the finest ones are almost in constant use in printing our A B C book, about the only way we can do when we lend them is to get new electrotypes made. Of course, we can not well afford to do this without pay. Now, in

thinking it all over we have decided to lend no cuts to any one; but to accommodate, we will sell electrotypes at the usual price of 25 cts. per square inch. This, of course, is but a small part of the original cost of the picture:

It has always seemed as if those who send us very large orders should have a little better rates than those who order only one article at a time, or, say, a dollar's worth of goods, or such a matter. Well, the truth is, friends, I have figured many articles down so low that there is hardly room for any discount at all, especially those sold at ten and hundred rates. However, we have decided to make a discount of two per cent on all cash orders of \$50.00 or over; three per cent on \$100 or over, and five per cent on orders of \$500 or over.

#### YOUR OWN NAME.

NEVER be ashamed to tell who you are. There may be circumstances under which it may be right to take an assumed name, or at least there are some people who claim there is; but I tell you, friends, when the time comes that it seems expedient to conceal your real identity, then is the time when you want to look out that you are not being led by Satan instead of God. I have just been told, in a private letter, that a prominent bee friend visited us, and stayed some time, going all over the establishment under an assumed name. The excuse given was, that I might charge him more for beeswax if I knew he was running an opposition fdn. factory. Is it possible any of you should think I am so afraid of opposition as that? If you want to go into the same business, come and look us all over; take measurements of every thing, and, if you wish, we will help you build your machinery, and give you the best advice we know how to give. It is just what we are doing every day. Do you think we shall suffer or lose, or lack business and work? "In my Father's house are many mansions. If it were not so, I would have told you." Even were it possible for some one to steal and carry away my business, they could not take away my faith in God. Is not "the life more than meat, and the body than raiment"? Another thing: Some of our bee circulars hail from apiaries with some high-sounding name, with somebody's name appended as *agent* or *manager*. Don't do it. Aren't you always "*manager*" of your own business? In business circles it is getting to be pretty well understood that all these obscure ways of doing are some sort of a dodge to evade payment of just debts. The institution orders goods, and, when payment is desired, the man who made the order says he is only the "manager," and thinks it ridiculous that you should think of holding him responsible. If your name is John Smith, put John Smith to the end of every thing you write, and then bend the energies of your life toward making the name of John Smith as good as the gold, so that all men may pronounce it good, at sight. Young man, *never* let the time come when you shall be afraid or ashamed of your own name.

#### CIRCULARS, ETC., RECEIVED.

Von Dorn, Omaha, Neb., sends us a 4-page list of apiarian supplies.

J. V. Caldwell, Cambridge, Ill., has sent us an 8-page list of "Supplies for the Apiary."

D. S. Given & Co., Hoopston, Ill., have issued a pretty 20-page pamphlet relative to the "Given Fdn. Press."

J. S. Tadlock, Luling, Texas, sends us an 8-page "Price List of Bee-keepers' Supplies."

G. W. Baker, Lewisville, Ind., sends us a fine 8-page price list of bees and poultry; 6 x 8.

Chas. J. Van Eaton, York, Livingston Co., N. Y., sends us a pretty 4-page list of "some of the implements" used in the apiary.

P. L. Viallon, Bayou Goula, La., has just received from our job rooms an 8-page list of every thing pertaining to his extensive apicultural business. Send for one.

E. T. Flanagan, Belleville, Ill., always up to the times in progressive apiculture, has kept our big press busy for three days last week on his new Catalogue for 1883. It will pay you to get one. The new firm is Flanagan & Hlinski.

Friend Muth sends an interesting supplement to his 1883 price list. It seems he has, on the first cover, finally perceived the merits of the Simplicity hive, and gives us Blanton's Simplicity bee-hive. He also makes a reduction on honey-jars.

L. E. Welch, Linden, Mich., has just received from our job-rooms a very tasty 6-page price list of bees and supplies for the apiary, 5 x 3.

F. Boomhower, Gallupville, N. Y., has also issued his price list of clamps and bees, in just the same style as the above, and from this office. "George the jobster" is now fairly reveling in new material, and is prepared to "throw" himself on the tender mercies of job printing which is now so rapidly coming into favor among bee-men.

Friend Hayhurst sends us his neat little postal-card circular, from which we extract the following, which sounds "just like him": "I guarantee safe arrival. If the bees reach you in bad condition, please send me, immediately, without affidavit or dead bees, your simple statement of the matter, and I will try again, or promptly return your money. I do not know that I have a single dissatisfied customer; but if there are any such, and they will write me in regard to the matter, I will do the best that I can to render satisfaction."

#### MRS. LIZZIE COTTON'S CIRCULAR.

I am being asked my opinion of the new circulars Mrs. Cotton is again sending out quite plentifully. The statements she makes, and the prices she charges for the goods she sends out, would, in my opinion, forbid her being classed with our regular supply dealers, to say nothing of the strings of complaints against her that have filled our bee journals for years past.

#### CONVENTION NOTICES.

##### CALL FOR A CONVENTION.

The bee-keepers of Northeastern Michigan are hereby requested to meet at the Dayton Hotel, in Flint, at 10 o'clock A. M., on Tuesday, Feb. 13, 1883, for the purpose of organizing a bee-keepers' association. All bee-keepers are earnestly requested to come, and bring with them any apiarian articles of interest that they may possess. A free room, and reduced rates of board, have been secured.

W. Z. HUTCHINSON.

The Tuscarawas Valley Bee-keepers' Association will hold a called meeting in Town Hall, Coshocton, O., on Feb. 14th, 1883, at 10 o'clock A. M. Every one interested in bees or honey is invited there. Come prepared to make a report of the bee business for the past year. Bring or send any thing pertaining to the business, and let others see it.

J. A. BUCKLEW, Sec'y.

## DOOLITTLE SAYS, STANLEY'S VANDERVORT FDN. IS THE BEST.

We can fill orders at once for a large amount of our celebrated foundation. Also any thing wanted by bee-keepers, at factory prices, or lower.  
Send for Circular.

2d G. W. STANLEY & BRO., Wyoming, N. Y.

## IF YOU WANT A HORSE POWER,

Don't make or buy one until you have sent for a Circular describing the WARREN POWER, to  
2d W. C. GILLETTE, LeRoy, Genesee Co., N. Y.

**NORTHERN GROWN**  
SEEDS, PLANTS, VINES, BULBS, ETC.,  
at growers' prices, grown at my seed farm, fruit garden, and apiary. Descriptive catalogue free.  
Address JOHN H. MYEIS,  
1-2d Saratoga Springs, N. Y.

1883- -1883  
**WANTED.**

ORDERS FOR EARLY ITALIAN QUEENS!

Three fine imported queens, to breed from, and 80 colonies of Italian bees. All will be devoted to queen-rearing. Single queen, \$1.00; 11 for \$10.00. Send for catalogue of Bee "fixin's." Beeswax wanted. J. S. TADLOCK, Box 42, Luling, Caldwell Co., Texas.

# DADANT'S FOUNDATION.

—UNSOLICITED TESTIMONIALS.—

Nothing is better; your fdn. suits exactly.  
Cincinnati, O., Oct. 23, 1882. CHAS. F. MUTH.

The finest and brightest I ever saw.  
Adamsville, O., March, 1882. GREEN R. SHIRER.

Thanks for promptness, and the splendid article sent.  
Canon City, Col., Jan. 6, 1882. CHAS. McRAY.

Fully equal to samples. Thanks for your promptness.  
Mansfield, Ind., June 14, 1882. D. S. KALLEY.

Best I have used; no breaking down; bees take it readily.  
Sidney, Ohio, Aug. 31, 1882. W. B. SPENCE.

I like it better than any offered by dealers.  
Baltimore, Md., Jan. 24, 1882. C. H. LAKE.

It is the nicest I have used.  
Louisville, Ky., June 20, 1882. D. KEYES.

It is the best I ever saw.  
Racine, Wis., July 19, 1882. GEO. WUSTUM.

Willing to pay 2 cts. per lb. more than for any I have seen.  
Mauston, Wis., March 23, 1882. F. WILCOX.

The most perfect article that I have seen.  
Christianburg, Ky. G. W. DEMAREE.

Very well satisfied. Bees worked on it finely.  
Aven, St. Genevieve Co., Mo. WM. BLOOM.

Have used about 75 lbs. from —, but I prefer yours.  
Sago, Muskingum Co., Ohio. REV. W. BALLANTINE.

Your foundation is the best.  
Charlottesville, Va., March 25, 1882. J. W. PORTER.

The nicest I ever received.  
Bloomington, Ill. H. W. FUNK.

Your fdn. beats them all. Bees draw it out further.  
Remington, Jasper Co., Ind. JOS. CROWDEN.

Ahead of any fdn. maker of the world.  
Borodino, N. Y. G. M. DOOLITTLE.

I concluded to send to you, even if express is higher.  
Council Grove, Kan. D. T. NORTON.

I never saw any nicer.  
Westfield, N. Y., March 31, 1882. G. TISDALE.

Better than any I have ever had.  
Mechanic's Falls, Me. J. B. MASON.

Well pleased with the foundation.  
Council Bend, Ark. GEO. B. PETERS.

We are working on a new set of machinery made expressly for us. But, friends, remember that, to fill all the orders, we need wax; and if you have some, please write us. We will pay a high price for it. Send for our retail or wholesale circular, with samples free. We sell also colonies, queens, and supplies.  
CHAS. DADANT & SON,  
27fd HAMILTON, HANCOCK CO., ILL.

A. I. ROOT, MEDINA, OHIO.

He that is faithful in that which is least, is faithful also in much.—LUKE 10 16.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. 1.

FEB., 1883.

No. 11.

MYSELF AND MY NEIGHBORS.

With what measure ye mete, it shall be measured to you again.—MATT. 7:2.

I AM not going to talk about bees to-day, children; I am going to talk about crickets. Do you know what a cricket is? I guess almost all of you have seen crickets, haven't you? They are long black bugs—are they bugs? Well, I don't know what else to call them, but may be Professor Cook will tell us some time, whether they are bugs or not. They have wings, I know, but I don't think they often use them. They have long feelers, too, that they wiggle about in a funny way when they walk, as if they couldn't see very well, and so were trying to "feel" the way, as it were. Did you ever hear a cricket chirp? I have, and that is why I remember them so well; for a great many years ago, when I used to go down to grandfather's, I always used to get homesick every night; and when I was homesick it seemed just as if the crickets were all looking right at me, and piping and chirping at me just because I was homesick, and they wanted to make me more so. Their chirping is always dismal to me ever since, and I always want to chase them whenever they crawl out of their holes after a hot summer day, and commence their sort of grating chirp. Come to think of it, I don't believe it is so very dismal lately, after all; for I know now that it is a kind of

song of theirs, and they only do it when they feel happy, just as the birds and frogs and tree-toads, and all of the insect tribes, tune up their songs; and while I think of it, I am rather inclined to think it is the way they have of praising God. If this is so, surely their little songs ought not to be dismal or distasteful to us. When I used to be in the "hen business" I used to sit for hours and hear my old hens sing. Did you ever hear a hen sing? Well, if you didn't, just ask your mother to tell you when one of your hens is singing, and see if you can't discover a melody in it. When a hen sings, she almost always lays an egg every day, and so pays for her food and lodging. Folks that sing about their work are usually the ones who are doing their duty, and paying their way, and the consciousness of this makes them happy, and, therefore, they sing.

There is a deal of singing in this world we never hear, just because we don't understand it. We get cross at the frogs because they croak and keep us awake nights; and yet the whole truth of it is, I suppose, they are only holding a frog concert, or something of that sort, and we in our selfishness don't understand it. Now just you look around you, and see how many of God's creatures are singing praises to him because they are happy, and yet we never thought of it.

Well, I declare! I told you I was going to

write about crickets, and then I got off and wrote about hens, and finally ended off with something about singing. Come to think of it, it wasn't *crickets* that I meant, either. It was critics. Critics; crickets; critics; crickets. Did you ever hear of anybody who got the two words mixed up before? I did. It was a boy who was speaking a piece. He meant to say,—

You'd scarce expect one of my age  
To speak in public on the stage;  
And if I chance to fall below  
Demosthenes or Cicero,  
Don't view me with a critic's eye,  
But pass my imperfections by.

And he did say, in winding up,—

Don't view me with a cricket's eye,  
But pass my imperfections by.

Well, now, children, a critic is not an insect at all. It is a person who makes it a business to look over and read, or "review," as it is called, the books and papers and articles that come out. You see, there are so many nowadays that nobody can read them all, and so we are very glad to have somebody tell us what ones we shall read, or what ones it will be most profitable for us to read. I presume you know that even our Sunday-school books have to be reviewed, and good wise Christian men and women are employed for the purpose of deciding what books are best, among the great numbers we have now to choose from. Literary critics are employed by our leading literary papers or magazines, to look over, or review, the new books as they come out, and they serve as a guide to the great masses of the reading public, to tell them what books they had best buy, and what ones they can not afford to waste time over. Do you not see, children, how very important it is that a critic should be not only wise, but kind, and free from any little spites or jealousies? Suppose the teacher should some day at school appoint you as judge as to whose essay or declamation was best, and you were satisfied that John Smith's was really ahead of any, but that you decided right away you wouldn't give it to him, because he pushed you off the sidewalk the day before. Would you be a just or an honest critic in that case?

You may say that the teacher has not appointed you as critic; but, my little friends, most of us have a way of appointing ourselves critics, and giving our opinions pretty freely, not only about declamations and essays, books and papers, but we set ourselves up as critics as to how people should dress, what they should say, and, in short, we often pick them all to pieces, you might almost say; and I am afraid, too, that we pick them to pieces, not to find all the good we can, but to pick out and hold up their faults. Children, do you ever talk about your neighbors at your house? If you do, is the talk something you would be glad to have them hear, if they should happen to be passing by the window at the time? What is the reason we take more pleasure in talking over people's bad qualities, than we do in speaking of their good ones? Or if we don't take more pleasure in it, why do we do it? Here is a little editorial I have recently clipped from the *Sunday-School Times*:—

In order to show yourself to advantage as a critic,

you need to watch for the good things that others would overlook, and hold them up to view, in your comments on what you have seen or read, or on one whom you have observed. You really disclose yourself, in all your criticisms on persons and things. Any nobleness there may be in you will show itself in your quick recognition of nobleness anywhere. Any littleness in your nature will show itself in your ready fault-finding.

You see, children, if you see noble things in those about you, it is because you have noble qualities yourself; and if you are all the while seeing little and mean things in the neighbors and friends around you, it is because you are little and mean yourself; or perhaps I should say, because *we* are little and mean *ourselves*. It is true, I know it is true, and it not only makes me feel sad and sorrowful when I think about it, but it sometimes almost makes me feel sick, because I am so much more apt to see people's faults than to see the good and noble traits there is in them. Children, it hurts anybody to talk about people, and make fun of their weaknesses or infirmities. It hurts us very much as it hurts us to say bad words; and if we persist in it, we shall surely have much trouble and sorrow. The next time you feel bad and gloomy and unhappy, just think back, and see if you have not been saying hard things about somebody. I am going to pray to God most earnestly that he will help me over this very, very bad habit, and also that he will make me to love the neighbors all around me, instead of letting any sort of hard or unkind feeling come into my heart toward them, even if they do sometimes do wrong and sinful things.

"With what measure ye mete, it shall be measured to you again." That is what a man said who is going to draw me some wood. He said he always gave a good full cord, because he wanted God to measure out mercies to him in that way. And I have been thinking that, if we talk hard about people, our conscience will be pretty sure to talk hard about us. I was going to tell you more about my neighbors here in the factory, and the way we do things; but I talked so long about crickets and hens and singing, and other things, that I shall not have any room left. Besides, we have a larger stack of children's letters than ever before, and I wish to give them all a place. That talk about critics has made me feel rather sad; but at the same time I begin to feel happier, and I know I shall be a great deal happier, if I only profit by my own little sermons. Now let us all keep a careful watch on these tongues of ours. "Forgive us our debts as we forgive our debtors."

## VIRGIL'S TREATISE ON BEES.

CONTINUED.

THE good editor has my thanks for the kind reception of last article, and the invitation to put in plenty of notes. If I give way to all the chat that I feel inclined to over Virgil's interesting points, I reckon the editor will soon have to put on the brakes a little.

WATER FOR BEES.

And where their drinking-place the bees shall will,  
Whether the water flows or standeth still,

Place in great stones, and willows thence to land, (1)  
That on these bridges bees may crowded stand,  
And spread their winglets in the summer sun,  
If luckless chance befall some lingering one,  
If rough east wind should sprinkle them with spray,  
Or headlong plunge in dangerous Neptune's way. (2)

#### PLANTING FOR PASTURAGE.

About these places there should freely bloom (3)  
Green cassia, and in fullness of perfume  
Wild thyme; and in abundance should there be  
The strongly breathing flowers of savory:  
Let violet-beds adown the mossy side  
Drink deep the hidden fountains as they glide.

#### HIVE-MAKING.

Moreover, then, the subject to pursue,  
Whether the hive itself be made for you  
Of the carved cork, (4) or willows woven o'er, (5)  
A hive should surely have a narrow door; (6)  
For winter hardens honey with its cold:  
Melted with heat, it can not be controlled;  
And thus 'tis plain, excess in each of these  
Alike is to be dreaded by the bees:  
And not in vain they stop the holes with wax,  
And fill, with mortar from the flowers, (7) the cracks.  
The glue collected for this special use  
Is tougher yet than birdlime's sticky juice,  
And firmer holds the ramparts of their lair  
Than Ida's pitch which Phrygians prepare.

#### NATURAL HIVES.

And oft, indeed, if common fame be true,  
Under the earth in caverns hid from view (8)  
Their household gods they worship and embrace,  
And live and thrive, and propagate their race.  
Deep hid in hollow pumice stone profound,  
And eaten cavities of trees they're found.

#### WINTERING, AND IMPORTANT MAXIMS.

Look to their chinky chambers in due time,  
And plaster well around with yielding lime:  
Put loosely o'er a mass of forest leaves,  
While roof of yew the winter rain receives. (9)  
Trust not your hives by marshes on the coast,  
Nor on the hearth the reddening lobsters roast; (10)  
Nor where bad smells arise from filthy mire;  
Nor where the concave rocks aloft retire —  
Each airy pulse such rocks return in sounds,  
And startled echo of the voice rebounds. (11)

Right here, to take the eleventh note first, is something of first-class scientific interest. There is an unsettled question whether or not bees have the sense of hearing. If, as Virgil asserts, they do not thrive when placed in the focus of an echo, that fact looks like tolerable evidence that they can hear. It is not very likely that the thing is a mere whim; very possibly it may turn out a fact. Who that has a rocky concave with a strong echo will investigate and report? Some of the children will be surprised to hear that bees are accused of being deaf. Sir John Lubbock played a fiddle within an inch or two of them, and they wouldn't waltz, wouldn't even beat time: didn't even care enough about it to try the key of *one sharp* on him to make him dance.

(1) Now, dear Novice, don't get huffy; this plan of watering is ever so much better than yours in A. B. C. I've tried that till I've got sick of it, and quit. More than three-quarters of the bees will go to a place of their own choice, and get water that is freshly filtered through cool mud. The few that did come around my jar were mostly after salt, I reckon. Warm water on a wooden board in the sun is a breeding-place for microscopic vegetation, and "leettle, teenty animiles" to give the bee-babie worms,

I believe. The willows would impart some of their own quality to the water, if the bees chose to take water from the middle of the bunch. Virgil's plan, as I understand it, is to put in two big stones, out where the water is nearly a foot deep, and then a big bundle of willows between the stones and the shore, fastening the ends with stones so they can not float away.

(2) This sounds just like a kind and wise man who does not want the poor bees to be drowned, as they very often are when their drinking-places are not improved.

(3) Lots of honey-people have tried a few honey-plants—and complained of naughty bees that would not notice the new posies at all. This is often because there are so few flowers of a kind; and possibly sometimes because the bees don't find 'em. Virgil's hint is, put your honey-patch right where the bees go to drink, and then they'll surely find it. And the plants themselves will not fail to secrete honey for lack of moisture.

(4) Cork is the very best material for the wall of a bee-hive, it is so dry and warm. In all the centuries since Virgil wrote, no one has contrived any thing better.

(5) Willows, of course, formed the cheap hive of the day. It strikes me that willow skeps must be better than the straw ones they use in Ireland and England.

(6) That, dear Virgil, is about the way I used to talk. But grim Death and old Boreas are a pretty strong span of lawyers, when they both get to arguing on one side of a case; and they argued with me till I gave up the narrow door for wintering my bees. Go, talk to Mr. Root; may be he has been ventilating some of his weak swarms to death this very winter.

(7) From the flowers, eh? We all put it down, that propolis is gathered from leaf-buds; but, come to think of it, I dare say the bees get most of their supply from flowers and flower-buds. Some flowers, sunflowers, for instance, have so much resin that your hands will be dreadfully sticky after handling one.

(8) O Virgil! how could you be so unkind as to spoil all my chance of getting a patent on my hole-in-the-ground colonies? Haven't told GLEANINGS any thing about them, have I? I got scared out—afraid the editor would make a wry face, and head it off, "Another one of friend Hasty's *fancies*."

(9) The man who can give a better method than this, for wintering a skep hive out of doors, had better hold up his hand, else Virgil "takes the cake." Plaster the old thing with lime mortar (early enough to have it get thoroughly dry, of course) then bury it in leaves, and shed off the rain with a substantial board cover.

(10) This is quite curious. There is no handy way to kill lobsters; so they are often put on to cook while yet alive. Evidently the Roman peasants had a superstition that the bees would resent such cruelties, and refuse to prosper where such deeds were done. Not the worst superstition in the world, was it? By putting these two cautions so closely together, Virgil indicates his own belief that it was the contiguity of the coast marshes, and not the sufferings of the poor lobsters, that made bees unprosperous. Of course, the people remote from the shore wouldn't have live lobsters to roast.

Richards, O., Feb., 1883.

E. E. HASTY.

Well done, friend Hasty. I think we may all feel happy in having such an able trans-

lator, and one with the real heart and spirit to make bees and Latin "connect." If you will excuse me, friend H., it seems to me you have not laid stress enough on this matter of covering the bees with forest leaves. In that line,—

Put loosely o'er a mass of forest leaves, he has given us the plan followed by the Dadants, exactly, and I am inclined to think that no better covering for the frames has ever been devised. We have had ample proof, you know, that bees have wintered in hives very open at the top, where they did not when well packed in chaff. Loose leaves seem to be just about what is wanted; and if I do not change my mind, I am determined, next winter, to try filling the upper story of some chaff hives with loose forest leaves, and nothing more. Would it not be funny, if we should take Virgil, in place of all modern writers, on this matter of an absorbent over the frames?

### FIRES.

MRS. HARRISON TALKS TO THE CHILDREN ABOUT BEING CAREFUL.

IT has been a very cold winter, and I have thought a great deal about fire, and the last month more than ever. I shudder whenever I think of the burning of the Newhall house at Milwaukee, Wisconsin, where seventy-five persons lost their lives. Men, women, and children burned alive! how fearful!

We should all be very careful about fire. In dry hot weather, sometimes the grass is of a brick color, and crumples under my feet, and then I'm afraid to light a smoker to quiet the bees. I like the bellows smokers, because we can smoke our bees with so much more safety than in the old way. I got on fire once, whilst smoking the bees with a pan of chips; and if I had been alone I might have burned up, and the bees and our house too. But, providentially, my husband was at home, and put out the fire.

Now, children, while you are young, and your habits are forming, you should cultivate *carefulness*, and that attribute called "presence of mind." When you are in danger, if you do not get excited, but keep calm, it may save your life.

Mr. Edison is a great inventor, and has found out a great deal about electricity, and has taken out more patents than any man in America. Since the Newhall fire, I have wondered why some one of inventive powers does not construct a ladder in sections that could be carried on the firemen's hose-cart, and shot out against a building. Persons have been rescued from a sinking ship by a line being shot over a vessel, and it seems terrible that people should be burnt up, for want of a ladder to reach them. Why don't some of the bee-keepers who have such a fancy for getting out patents get up a ladder for our use? Bees cluster pretty high, sometimes, and I've always expected to tumble, and get badly mixed up with a swarm of bees and a basket or dishpan clattering about my ears. It might be fun for those who look on, but I don't believe I should enjoy it very much. Do you think I should?

Peoria, Ill.

MRS. L. HARRISON.

There are a multitude of patent rights, my friend, for fire-escapes, as they are call-

ed, and our friend Oldroyd, who makes the ink, "W. O.," you know, has just got out a new one. It is made to slip on a rope; and although he is an old man, he says he can come down from a five-story window in just half a minute. These machines may save much valuable life; but at the same time, I think our houses should be so made that one can easily get out, in case of fire. It was on this account, for one thing, we have a back stairs to our new house, as well as front stairs.

### DOORS.

A LESSON TO BE LEARNED FROM THEM.

IT makes but little difference to us about the beauty or polish of our doors, if they fail to perform their duty of opening and shutting at our pleasure. If they don't do this we go to work with hammer and saw, with chisel or plane, or whatever instrument will best serve our purpose, and in the end that door is brought to "its senses," as it were. In some such way the Lord deals with his children. "Whom the Lord loveth he chasteneth."

Doors were not made to be banged and beaten and scarred; they are weak and inoffensive; and however much they are defaced by abuse, they are gentle and uncomplaining, ever ready to have their "faces washed," and, if need be, scrubbed and painted and varnished. Now, don't slam the door. Do not abuse it; and don't leave the door open this cold weather, for some one to get up and close.

Don't open the doors of all houses, especially *ale*-houses.

Let your door be open to the poor, to God's children, and let the door of your hearts be open to receive every good impression, and closed against the many sins that would enter. As you open the door of this new year, drive out the little foxes of sin, and, turning your back on Satan, enter into the fold of Christ.

If any one should be so bold or so wicked as to try to come in at the window, or to make an opening in our houses where it might seem more convenient for them to enter, we would treat them as the law would allow. Jesus says, "I am the door; by me, if any man will enter he may come" into a place of safety. Let us not try any other way, or we shall be classed with the "thieves and robbers," who are never safe, neither here nor hereafter.

Anderson, Ind., Feb., 1883.

E. MOHAN.

### ABOUT THINGS THAT GROW.

SOMETHING FOR LITTLE FOLKS TO HAVE AND TO LOVE.

MY pa doesn't keep bees; but mayn't I come and see you? I wonder how many of you have flower-gardens, all your own. And what flowers do you have in them? Did you ever sow seeds in the house, and do you know how interesting it is to watch them sprouting, and then growing day by day, so tender and velvety green? And do you wonder, when the first two leaves are grown, what the next will be like? Did you ever see "Mollie Heath" poke her brown hood above the soil in the pot, and try to push her back again (as I did), thinking there was something wrong? You see, she comes up the way the beans do; and, by the

way, I know a man who saw that his beans were just up, shell and all, and went and pulled them all up, and planted them again with their roots in the air. But he was not a farmer nor a bee-keeper.

If you want something pretty in your yard, get your pa to saw off a nail-keg half way, and set it on the cherry-tree stump. Bore a couple of small holes in the bottom, and put in a layer of cobble stones for drainage. Line it with sods from the meadow, and fill up with rich earth, putting in such fertilizer as you wish. Plant a small wooden ladder in the center, and put in one or two plants of the Kenilworth ivy, also called "love in a tangle." Give it plenty of water, and it will reward you. One day in hot weather I saw a bee hover over mine and crawl away under to a large leaf full of water, which she drank in as though it were honey. Did you ever see a bee drink? But the prettiest vine for the shade is the maurandya. This grows easily from the seed. One plant will nearly fill a window. It does not twine, but climbs by its leaf-stalks, which twist around a thread once, holding firmly to it. Both of these grow nicely from slips. I should like to tell you about my flower garden, but I am afraid Uncle Amos will think this bee is not after honey. So, good-by. BEEULA A.

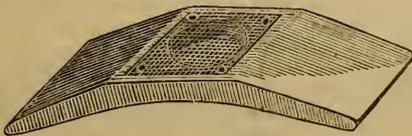

#### A STORY WITH A MORAL TO IT.

DOES IT PAY TO FEED? AND WILLIE'S DEVICE FOR WINTER FEEDING.

**M**Y father used to take GLEANINGS; but in going to the public library he found it contained all of the bee-books, including your valuable A B C in bee culture, so he concluded he had enough to read for at least one year. As my father is employed in the Peoria postoffice, and as I frequently go there, I saw, at one time, your JUVENILE; and, not seeing the report of this part of the country, I will send you ours for the last season:—

Having two swarms to start with in the spring, and the season being very backward, wet, and cold, father was compelled to feed his bees until about the first of June, so as to keep them from starving. As he had fed his bees with three dollars' worth of A sugar, mother often wanted to know how he was to get back his money for the sugar he fed. But as white clover opened, and, having the bees strong in numbers, they gathered honey rapidly. We received over 200 lbs. of comb honey, and sold \$40.00 worth, besides having all we wanted for family use.

The bees increased to five good swarms by natural swarming; I hived them, and father gave me one good swarm. Now, Mr. Root, I will send you one of father's inventions by this mail. I will not describe it, as you will see the model.

DEVICE FOR WINTER FEEDING.

Father thinks it is of great value. It permits the bees to cluster, or pass from comb to comb; and in spring, in feeding up stocks, having a hole cut through the carpet, where the wire screen is, it prevents the necessity of disturbing the bees. By taking a tumbler or fruit-jar, filling it with syrup, and tying

a muslin cloth over the mouth of it, inverting the jar, it enables the bees to carry the syrup below.

This is my first letter, and I hope you will have a waste-paper basket large enough to hold all of this.

Peoria, Ill., Jan. 20, 1883.

WILLIE DARR.

If I am not mistaken, Willie, more than one wife and mother—aye, and perhaps a few fathers too—have worried about the sugar it has taken to feed "those bees." In your case, I presume mamma was most agreeably convinced, and we can readily excuse her, for she probably had not learned what bees may do.—The device you send is substantially a Hill's device, made of solid wood, with a hole in the center, over which wire cloth is attached. This hole serves for ventilation, or for feeding. A fruit-jar, with cheese cloth over the mouth, may be inverted over it, and it can be put on and taken off without it being possible for a bee to get out in the way, to sting or get lost. There, now, Willie, it has just popped into my head, what it is we want for this purpose. It is a small wooden bowl, with a hole bored through the bottom, and wire cloth tacked over it. Of course, a hole must be made in the carpet or enameled sheet, to match the hole in the bowl, and then we have it. As a cluster of bees is usually a little oblong, I would rather prefer an oval bowl; but I presume it will not make very much difference.

#### THE AMERICAN BOY.

OUR PICTURE ON PAGES 164 AND 165.

**B**OYS and girls who take to bees are, as a general rule, if I am not mistaken, of the class who are a little on the line of inventive genius, and are, therefore, if I have rightly divined, about the sort who will be interested in our "big picture." The picture is a copy, reduced in size by the photo engraving process, of one that recently appeared in the *Mechanical News*, published by James Leffel, 110 Liberty Street, New York. Many of the scenes bring quite vividly to mind experiences of my own boyhood days; and as they come up, I think I will tell you a little about it.

The opening scene is, I suppose, with the clock. What enterprising youngster has not looked wonderingly at the curious machine which, almost like a thing of life, pegs on, and tells us the time? The first clock we ever had in our little household was a monster of a weight clock that I traded for. We used it, because Sue and I were saving carefully, and it saved the money a new one would cost. It answered the purpose nicely. Ernest got to be about as big as the urchin in the picture, when he one day climbed up just about as in the picture, opened the ponderous machine, but, pulling a little too hard on the door, it tipped forward and went over his head, weights and all, and "bake, bake, bake mamma's clock all to pieces." Mamma was so much rejoiced to find it didn't "bake" the baby "all to pieces," she didn't scold very much. When he saw the ruin he had made, he ventured, "Can't papa fik es?"

The wind-mill must have been myself, for

wind-mills were my hobby; and my happiness to sit and see them go, after they were all put up, was only equaled by my grief when some great wind blew them all to bits. One of my home-made ones, made of cloth and sticks, and bits of wire, churned the butter for a whole summer.

I, too, had the boating fever, but the boats were mostly built and launched by my brother, older. Some boys' boats are now slung up in the warehouse, away up under the rafters, and they have quite a likeness to the one in the cut.

Many of you know something of my first printing, and how the press was run by a wind-mill, after we got too many subscribers to print them easily by foot power. Scroll saws and amateur photographic outfits were things that came in vogue after my boyhood had passed. The same with the telephone; but my brother and I did start out to make a wooden locomotive, with an old stove-pipe for the boiler. The water-wheel was all faithfully worked out, and the saw-mill that it carried was the delight of the neighborhood. The same pond (built by much hard labor in carrying sods) that furnished water for the saw-mill, also carried the home-made boat; and didn't we find real happiness in the improvements made on it day by day? Sometimes some of the girls at school came over to see, and you can guess there were particular girls there in that old schoolhouse who had an especial interest in the affairs of certain boys; and when *they* admired the pond, the boat, the water-wheel, and saw-mill, I tell you but weren't we happy? Telescopes? It was I who was crazy about a home-made telescope when I was a boy; but it was the older brother who actually had one, and studied the heavens with it when he was a man.

Now I have talked about all except the grindstone. Did you ever see a boy grind his knife, when some new machine was to be builded? Isn't the picture an apt one? The chap with the knife is so absorbed in it he doesn't think that his younger comrade is getting tired; and while the poor little chap doubles himself up, in his weariness, wishing the other would get that "edge on it" pretty soon, he almost envies idle Fido, who has an interest *always* in what the boys are at work at. I can very well remember how I used to turn grindstone for father, and how I declared, mentally, I would some time have a water-wheel or a wind-mill that would make the pesky old grindstone go of itself, some way or other. Well, I guess we did, for now we have a great emery wheel that goes itself, and carries the knife back and forth, of itself too, until it looks as if it almost had sense and brains, as well as the rest of us. Don't you think this is a rather nice world to live in, children? I do, and I thank God to-day for wind-mills and water-wheels, boats and printing-presses, locomotives and telephones, telescopes and cameras,—aye, and for the bright go-ahead boys and girls who are day by day growing up and learning how to use them, and through them learning how to love the kind Father who gave them all.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACTS, NOT GENERALLY KNOWN, ON BEES & OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye takin' notes,  
An' faith, I'll prent it."

**I** WONDER how many of our little friends know why they have lanterns that give a red light, on our railroads. Well, a red light is a signal of danger. When one train is ahead of another, it hangs out a red light on its last car, that the train behind may be warned of danger when they get in sight, and see the red light. If a bridge is broken down, or the track is out of repair, or any thing of that sort, a red light is hung or waved some distance before it that they may have warning so as to stop in time. Well, the idea has been suggested that we often need a red light to warn us to look out for certain things that are bad for us. One of our Christian papers has what it calls "red lights," to warn teachers and pupils, in studying Sabbath-school lessons, lest they get to arguing on doctrinal or other points, and so waste time uselessly. It is a rather sad matter to think of, but I believe even Sunday-school teachers do sometimes need a red light held up before them.

Well, now, I wonder if we little folks need any sort of a red light to be held up before us, when we are writing these little letters. Shall I tell you of a few things that I have to mark out very often in your letters, because it is something everybody knows already, or because you all say the same thing over and over too much? I think you won't feel hurt, if I do, will you? I am sure you will take suggestions from Uncle Amos, will you not? All right; here are the red lights:—

#### RED LIGHT NO. 1.

Do not say, "I thought I would write you a letter," when you commence. Just write the letter and that tells the story. Neither would I say, "I take my pen in hand," etc. Away back, when I was a little boy, we used to have a lingo something like this: "I take my pen in hand to inform you that I am well, and hope you are enjoying the same blessing." I don't mean there is any thing bad about it, but it is a very old phrase, and most people have seen it so

many times they are very apt to laugh when they read it. In our office here I tell the girls to pitch right into business, and say what needs to be said, and not a word more; in fact, we don't even stop to say "mister" in our letters, but just commence and talk. You see, it takes time to write useless words, and then it takes more time for very busy, hard-worked people, to read useless words.

#### RED LIGHT NO. 2.

I believe, little friends, I would not say, "My pa takes GLEANINGS," or "My pa keeps bees," any more, for the fact of your writing a letter usually implies that he takes it, and keeps bees also. I don't think I would say, "I like honey" any more, either, for so many have said it I am afraid the older ones will begin to laugh when they read our little journal. As a general thing, I don't think I would say, "I go to school," either; for it is to be expected that every boy and girl goes to school nowadays. There, I guess I won't find any more fault now, or else somebody might hold up a red light to me, and say, "Mr. Root, don't talk so much, but let the children talk," and so I think I will. I just want to say, that your letters for the most part are excellent, and I am astonished every month to see how much little folks can do in the way of helping in the great business of the world, of giving as well as receiving knowledge.

#### FROM ONE TO FOUR, AND 75 LBS. OF HONEY, ETC.

My pa keeps bees. He had one hive in the spring. He has four now. He took about 75 lbs. of honey.

MILLIE HOOVER, age 8.

Huntsville, Pa., Jan. 23, 1883.

#### DRONES FLYING IN DECEMBER.

Papa has a hive of bees, and the drones were out flying Dec. 2. They are the Holy-Lands.

GERTIE REESE, age 12.

Coatesville, Chester Co., Pa., Dec. 20, 1882.

I am 8 years old. I live in the country. Pa has 18 hives of bees. My grandpa has 30 hives of bees. We took lots of honey this last fall. I go to school, and have a fine time. I wash dishes for my ma. This is my first letter.

CECILIA FETROW.

Yocumtown, Pa., Jan. 27, 1883.

#### FROM 1 TO 91, IN 3 YEARS, AND LOTS OF HONEY.

Grandpa had one Italian; in 3 years he had 91. We took lots of honey this fall.

JOHN FETROW.

Yocumtown, Pa., Jan. 29, 1883.

If your grandpa had just "one bee," friend John, he did pretty well, surely.

To-day I am 8 years old. My papa has 24 stands of bees in Simplicity hives. He makes hives on a home-made foot-power saw; also his own sections. He took about 1000 lbs. of honey from Aug. 20 to Sept. 15. We had to feed our bees in June.

Clinton, Mo., Jan. 20, 1883. MARY V. BROWN.

We have 26 stands of bees; part of them are Italians. I help papa with his bees, and he gave me one stand. It swarmed last season, and now I have two. I like to work with the bees, but I don't like to get stung, though when I have my bee-hat on I am not afraid of them.

EDWIN L. GRUBB, age 11.

Key, Ohio, Dec. 20, 1882.

#### FROM 13 TO 40, AND 900 LBS. OF COMB HONEY.

My pa and my brother Albert have got 40 hives of bees, all packed in chaff, and they seem to be all right now. They increased from 13 to 40, and had about 900 lbs. of comb honey. The bees are mostly Italians and a few hybrids.

KATIE UNTERKIRCHER, age 14.

Manchester, Mich., Jan. 21, 1883.

#### THE OLDEST ONE OF THE FAMILY.

I am a little girl six years old, and I want a book, so I will write you a letter. Pa keeps bees. He has 22 hives. I help him to fold the boxes. I like honey and bees. I have one hive I call mine. We did not get much honey last year. Pa says catnip is the best honey-plant. I have two brothers and one sister. I am the oldest.

VIOLA HARROLD.

Columbiana, Ohio, Jan. 21, 1883.

#### MINTY'S LETTER.

Pa has 10 hives of bees, and they made a fine lot of honey this summer. I like to see them swarm. I look on when pa or my sisters hive them. Pa uses the Simplicity hive, and he wants to buy some more. I like to see the bees, but I don't like to get hold of the pointed end of them.

MINTIE S. BLOOM, age 8.

Shelby, O., Jan. 22, 1883.

So your sisters hive bees, do they, Mintie? I think your pa must be real glad that he has daughters that can help so much.

Mamma has three hives of bees this winter. She had seven last summer. It has been very cold this winter. We have had three pretty deep snows. I am going to school now; am studying the Scholar's Companion, Rhetoric, Manual of Geography, Familiar Science, Dictionary, and Arithmetic. Don't you think that is pretty well for a boy of 13? Send Silver Keys, when you publish this.

J. EMORY HUGHES.

Yellow Branch, Va., Feb. 3, 1883.

Pretty good, Emery, especially if the boy got all lessons well.

#### WHAT MARK SAW AT THE FAIR.

My pa has 49 swarms of bees. They are packed on top with hay, and on the sides with sawdust. They are on the summer stands, except 5 which are in the cellar. They are all alive now. They want to fly badly. Pa took his extractor to the fair this fall, and everybody was looking at it, and wondering whether it was a churn or washing-machine. One old lady said she'd rather have her old churn than that. There was a Given fdn. press, lots of bees and honey, and other fixings at the fair.

MARK T. HOWER, age 10.

Adrian, Mich., Jan. 22, 1883.

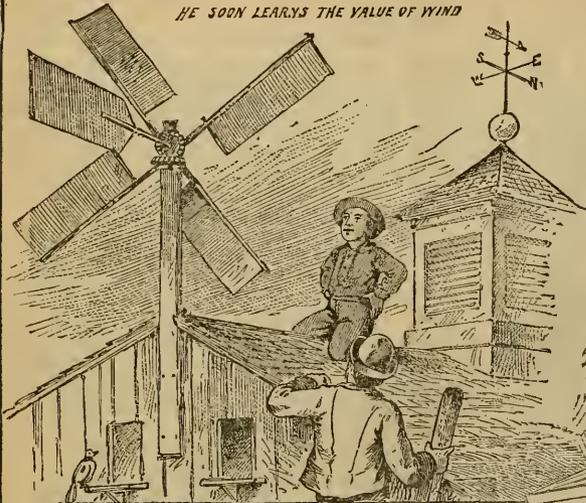

#### A NUCLEUS ON THE MANTLEPIECE.

We have 57 colonies of bees; 40 of them are mine. You wonder how I got them. Well, I will tell you. My grandpa gave them to me. He gave me one stand. I do not think I was 6 years old then, and now I am 13. Pa has got a nucleus in the house on the mantleboard. He found it on a tree last autumn. He does not think they were any of ours, for they were black, and ours are Italians. He lets them fly in the house sometimes, and then, oh for the window-blinds! Where in the Bible can the word butter be found? The place where it says not to offer honey as an offering, can be found in Lev. 2 : 11.

LILLIE A. GANDY.

Churubusco, Ind., Jan. 20, 1883.

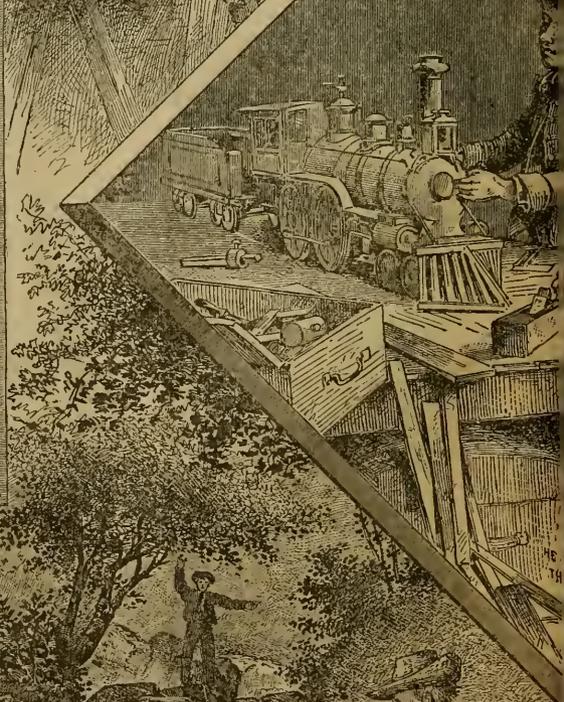

HE SOON LEARNS THE VALUE OF WIND

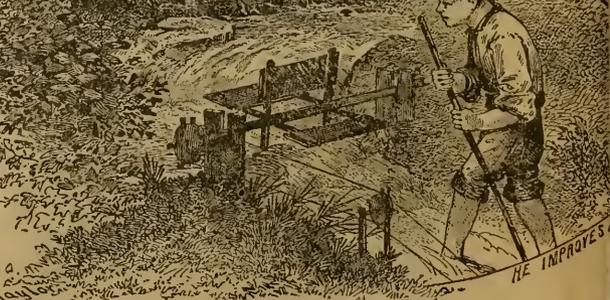

HE DETERMINES TO BECOME AN EXPLORER.

...CKS  
...LIVE  
...THE WATER PRIVILEGE

## FROM A TENNESSEE JUVENILE.

My pa has 34 hives of bees. Some of them have young bees just hatching out. Yesterday all the bees in one hive, that had some sealed honey in it, swarmed out. Pa caught the queen and put them back. He is making some Langstroth hives. I help make the frames.

BURTON WORLEY, age 9.

Isom's Store, Maury Co., Tenn., Jan. 28, 1883.

## LAURA'S LETTER.

I thought I would write you a letter. Pa got me a stand of bees, and I am a going to watch and help her hive them when they swarm. Ma is going to let me have a swarm and a hen, and some turkey eggs. This is my first letter. Please send me a book.

LAURA MOTE, age 9.

Six Mile, Jennings Co., Ind., Jan. 23, 1883.

My pa is a farmer, and keeps a few bees. He has 40 colonies. Last spring, No. 11 swarmed; 8 days after, pa looked at them to see if they were going to swarm again, and found them busy as bees, killing drones; and so he went to the timber. But they swarmed and in a short time I hived them.

LONE C. SPERRY, age 13.

Nokomis, Ill., Jan. 29, 1883.

I have 3 swarms of bees. I took 33 dollars from them, so you see old Pa. is not behind yet. Ma has 31 good ones; took lots of honey. Pa is making board rules, and taking care of his little trout. We have 16,000 fish in our ponds. This is my first letter. I have never been to school.

GUSTA ELLENBERGER, age 7.

Ladensburg, Pa., Jan. 22, 1883.

## SOME OF THE REASONS WHY FARMERS SHOULD KEEP BEES, IN PREFERENCE TO OTHER STOCK.

Papa keeps some bees in the summer, and some steers in the winter. I believe I would rather keep bees than steers, because bees can only sting, and steers can both horn and kick.

WILLIAM D. BOSSERMAN.

Gettysburg, Pa., Jan. 29, 1883.

## FROM 3 TO 7, AND 160 LBS. OF HONEY.

My pa keeps bees. He had three colonies of bees to begin with in the spring. He had one natural swarm, and increased to seven by dividing. We got 160 lbs. of surplus honey. If this is worth a book, please send me Ten Nights in a Bar-Room.

WILLIAM J. GREEN, age 9.

Detroit, Mich., Jan. 22, 1883.

I guess it is worth a book, William, for it is a very good report from a small apiary.

## THE BOY THAT IS GOING TO BE A BEE-KEEPER, STORE-KEEPER, AND SCHOOL-TEACHER.

Ma says that I may write to you. I have no brother to play with, so I read to my ma. I have only one sister, and her husband is a bee-keeper. He has nearly 200 colonies. Perhaps I shall begin to take care of bees some time. I go to Sunday-school, and to day school when there is any. There has been vacation for two weeks. School begins to-morrow. I am studying to be a school-teacher. I think I should like to be a store-keeper.

CLARENCE W. SQUIER.

Coopersville, Mich., Jan. 7, 1883.

Hadn't you better come and live with me, Clarence? I am bee-keeper and store-keeper now, and I used to be a school-teacher once.

## HUGH AND HIS PUP.

My grandpa would like to have me and my brother take a hive of bees on shares. Probably I will if they live till spring. My grandpa has bees, and I go to see them sometimes. I have a young pup, and have lots of fun with him. Sometimes I go hunting, though game is scarce in this section.

HUGH A. ALVIS.

Montrose, Lee Co., Iowa, Feb., 1883.

We want your paper, and should have sent for it the first of the year; but we expected to see you at the State Bee-Keepers' Association at Indianapolis, but failed. Pa and I went there, and had a good time. We shall want more hives and fdn. in the spring, if the hard winter doesn't kill our bees.

C. P. HOCKETT.

Jonesboro, Grant Co., Ind., Jan. 24, 1883.

Well, I declare! I should have felt sorry had I known any of the juveniles were there looking for me.

## A COUPLE OF FLORIDA JUVENILES.

My papa keeps 50 swarms of bees. We would have more honey; but in February and March, people burn the woods off and burn all the other flowers up. Our bees have not swarmed this year.

ELBERT A. FROSCHER, age 9.

La Grange, Fla., Jan. 27, 1883.

Elbert wrote to you, and mamma said I can too. I have two little rabbits. I love to see mamma and papa extract honey. They extracted 80 gallons in one day. Ma holds my hand and lets me write. Elbert wants a book. I want Silver Keys, if you think I ought to have one. I am 5 years old.

CARRIE BELL FROSCHER.

Titusville, Fla., Jan. 17, 1883.

Very good indeed, Carrie Bell, for a five-year-old bee-girl. Who would have thought friend Froscher had a boy and girl, who could write letters?

## FROM A LITTLE GIRL WHO HAS NEVER BEEN TO SCHOOL.

Mr. Rackwood has 20 stands of bees. We live with him, and he sends to you for a good many things. I have one sister, and her eyes are as black as charcoal; and I have three brothers too. I have not been to school a day in my life.

EVA GLAWSON, age 10.

New Smyrna, Fla., Jan. 25, 1883.

Papa put away 94 stands of bees in the bee cellar. I go to school most of the time. I missed only 3 days on account of deep snow and bad weather. I help mamma; I can wash dishes, sweep floors, and do lots of other things. My papa has gone to Eureka Springs, Arkansas, for his health. This is the fourth day that the thermometer has stayed below zero all day. This morning it was 30° below zero.

OLLA E. BARGAR, age 9 years.

Border Plains, Webster Co., Iowa, Jan. 22, 1883.

## A SWARM OF BEES FOR WRITING A LETTER — WHIEW!

I have been reading the children's letters in the JUVENILE. I have decided to write one. I am 11 years old, but this is my first letter. My pa keeps bees. He has 93 colonies in Langstroth hives. He has promised to give me one for writing this letter. He is going to start out next week to sell some bees. He is going to sell some A B C books if he can. I am going to school now to my ma. There is no Sunday-school near us this winter.

Pinson, Tenn., Jan. 31, 1883. SHEPPY SIMMONS.

## A BRIEF REPORT.

Pa did not have very good luck last summer. We have got two hives of bees. We have received no honey from them this season.

LEWIE KETCHAM, age 9.

Port Crane, N. Y., Jan. 23, 1883.

I have 2 hives of my own. Pa has kept bees for a long time in box hives, but we don't get much honey. We are going to transfer in the spring to Simplicity hives. We are going to get them from Mr. Flanagan, so as to avoid freight. I like to read GLEANINGS. Pa doesn't take it, but I borrow it from one of our neighbors. Lizzie and I don't have very far to go to school. Lizzie is my little sister. We don't learn bee-keeping at our school.

JOSEPH SCHROEDER, age 12.

Freeburg, St. Clair Co., Ill., Feb. 2, 1883.

## BLASTED HOPES.

My mamma went to visit grandma in Keithsburg, Illinois, last summer. She gave us a stand of Italian bees. They were expressed here in August; but the dry weather had burnt up every thing, so the poor bees could not get any honey. We fed them for a good while, then the poor things died. We all felt bad about losing them. I hope mamma will soon get some more.

MOLLIE TESTER, age 11.

Salt Creek, Kan., Jan. 30, 1883.

But you ought to have fed them a good deal more, friend Mollie, so they couldn't starve.

## CATNIP SEED.

Pa has four stands of bees. We had all the comb honey we wanted to use and some to sell. Do you buy any catnip seed, and how much do you pay for it?

MARY PERRY.

We have all the catnip seed we shall need for some time, Mary, but we want some horsemint seed.

Pa has 4 stands of bees. They made a lot of honey, and would have made more, but for the dry season. Pa takes GLEANINGS, and I love to read the JUVENILE. I wish we could hear more of Merrybanks. I should like Rescued from Egypt for pa's renewal. If you think this worth printing, please send me "Ten Nights in a Bar-Room."

CHARLEY PERRY.

Southbury, Conn., Feb. 5, 1883.

## FANNIE GREEN AND HER LITTLE SISTER.

Some of my schoolmates have written and got quite nice books. My name is Fanny Green. We do not keep bees now, for they all died two years ago, and we have not had any since. My little sister is going to put her letter in with mine. Mother says I had better put five cents in my letter, and that will pay for a book for some little girl who can not buy one.

FANNIE A. GREEN.

Clarence, Erie Co., N. Y., Jan., 1883.

THE LITTLE SISTER'S LETTER, PUT IN AS SHE PRINTED IT.

I am seven years old. I can not write, but I can read, and I want a book. I would like Bennie's White Chicken.

MAMIE GREEN.

Clarence, Erie Co., N. Y. Jan. 11, 1883.

Your letter is very good, Mammie, and I read it all real easy, which is more than I can say of some of the big folks' letters.

## THE "YELLOW" QUEEN-CELL, AND WHAT CAME OF IT.

My pa has 23 stands of bees, and I believe he thinks more of bees than any thing you can give to him. He gave me a stand of bees last spring, and I

gave it a nice yellow queen-cell. It hatched out, and my pa looked at it and saw a nice yellow queen, and in about a week afterward I looked for it, but could not find it; so I gave it another black queen already hatched out, and I fed it with sugar boiled with water, and in a few weeks it swarmed out. We put it back in the hive, and in the evening when I was not at home it swarmed out and went away. Now, my pa says he will give me another one in the spring. So all my work was for nothing.

HOMER A. KAU, age 11.

Columbiana, O., Jan. 22, 1883.

Not altogether for nothing, was it, Homer? Didn't you learn something about bees, by that experience?

## THE FINCH CHILDREN.

## REMINISCENCES ON BEES.

My father used to keep bees, but is not able now. I can remember of standing on top of the hives to pick apple-blooms from the trees that stood just behind the hives. I don't think I ever got stung from it.

ANNA E. FINCH, age 14.

My old hen stole her nest in the woods. She hatched 12 chickens, about the first of October. A stone fell on two and killed them; 5 died. I sold my hen for 20 cents. I have 5 chickens left. I bring in almost all the wood we burn, and snow for ma to melt to wash with.

WILLIE C. FINCH, age 6.

Well done fore a 6-year-old chick, Willie.

## BEES IN SYRIA, BY A JUVENILE.

One day last summer we had visitors who live 6000 miles from here — ma's cousin and her husband and little girl. He is a missionary in Syria, Asia. He was at Beyrout when Frank Benton landed there. The little girl's name is Mizpeh. The Arabs call water *moi*. They keep their bees in earthen jars fastened in stone walls; and when they want honey they take the jar out and break it. There are 120 sheets in a quarter of a ream. How much is the postage on it? Bible question: Who washed his steps with butter?

ADA J. FINCH, age 12.

West Township, Albany Co., N. Y., Feb. 6, 1883.

Well done, Ada. The postage on the 15-cent note paper is 13c. It is best to have it go with other goods when practicable.

## HOW RUSH "DIDN'T" GET THE BEES DOWN OUT OF THAT ELM-TREE.

This is my first letter. I have one swarm of bees. I had two. I gave my sister one for watching bees. Father has 73 swarms. Last summer father went to town, and while he was gone a swarm of bees came out and alighted on a big elm. Mother and myself got the swarming-box, and tried to get them down; but, down they did not come; so I got a big ladder and set it up against the tree, and I went up with the swarming-box and brush to get them down. But, no, sir; that did not work. They stung right and left. I saw I could not do any thing with them. I was determined they should not go off, so I got some water and gave them a cold bath, and kept it up till father came home, and he had some trouble to get them down, they were so cross; but they made lots of honey. Now if this is worth a book, please send Ten Nights in a Bar-Room.

RUSH HOLMES.

Sauk Rapids, Benton Co., Minn., Jan. 30, 1883.

Of course it is worth a book, Rush, and you did as well as any boy could well have done under the circumstances.

HAD TO BE FED IN JUNE, AND GAVE "ONLY" 320 LBS. OF HONEY.

Pa had to fed his swarms of bees in June — something never heard of here before. They gave him only two new swarms; 8 swarms gave us 320 lbs. of comb honey. Pa puts his bee-hives for winter in boxes with four inches of chaff all around them; he never lost a swarm in wintering.

GRACIE M. HORTON, age 10.

Smithboro, Tioga Co., N. Y., Dec. 11, 1882.

FROM 3 TO 6, AND 120 LBS. OF HONEY.

Pa has 3 stands of bees. In the spring he increased to 6, and got 120 lbs. of honey. He has them on their summer stands, under a shed. They are all right yet. I have a little brother, four years old. He watches the bees in swarming time. Pa gives him five cents for every swarm that comes out. This is my first letter, and if I deserve a book, please send me Ten Nights in a Bar-Room.

CASE VANDERBELT, age 11.

Riegelsville, N. J., Jan. 22, 1883.

FROM 11 TO 20, AND 3½ BARRELS OF HONEY, AWAY DOWN IN FLORIDA.

We had 11 swarms in the spring, and increased to 20. We got over 3½ barrels of honey. Our bees are Italians and hybrids and blacks. We get lots of oysters and fish. My sister Eva is going to write a letter too. If my letter is worth a book, please send me Pilgrim's Progress. GEORGE F. GLAWSON.

New Smyrna, Volusia Co., Fla., Jan. 26, 1883.

To be sure, it is, George. But wouldn't I like to come and see you, and look at the bees, and get some fish and oysters!

My pa has about 15 stands, and they seem to be wintering well up to this date. He packed them in sawdust for the winter. He did not get very much surplus honey, on account of poor season and dividing up for increase. My pa bought an extractor and honey-knife, and some very nice foundation from you, and thanks for your promptness in sending the same. On the 27th day of this month the thermometer went from 10° above zero to 46° below, in 10 hours, which is very uncommon for this country.

FLORENCE E. COOMBS.

Memphis, Clark Co., Ind., Jan. 30, 1883.

From several letters in this number it will be seen that from Jan. 20 to 30 the weather was the coldest recorded. This will go far to test the relative merits of cellar and out-door wintering.

WHAT JAMES DID WHEN HE WAS TWO YEARS OLD.

My papa has 23 stands of bees. When I was two years old I went to my papa's bee-stand and pulled off a board in front of it, and the bees flew into my face, and about 75 stung me. My mamma pulled the stings out, while my papa ran to the drug-store to get ammonia and the doctor. My papa thought I would not live; but I got over it, and am now 10 years old. My papa made about 3 or 4 hundred weight of honey last year. He has Italian and hybrid bees, and black ones too. He made no white honey at all; none was made in the whole country about here. My papa got all his bees in Langstroth hives.

JAMES PETERSON.

Salem, N. C., Feb. 8, 1883.

STRAWBERRIES, CHICKENS, EGGS, ETC.

My name is Anna. My parents are dead. I have three brothers and four sisters. I live at my uncle's. He raises fruit and vegetables; and our neighbor, Mr. Klarr, has lots of bees and lots of honey. I

don't like honey, but I like strawberries and cream with a big lump of sugar in them. I am going to school. We raise rye; have chickens and lots of fresh eggs; we live two miles from town.

ANNA MOORE, age 9.

Pana, Christian Co., Ill., Feb., 1883.

THE SWARM THAT WAS UNDER THE HIVE.

My father has been a bee-keeper about 8 years, and has 39 swarms. Last summer he bought an Italian queen, and we were going to divide a swarm, and I happened to look under the bottom-board, and saw a swarm that had begun to make comb under there. Father put those that were under the stand in a hive, and gave the queen to the old swarm, and they did well. Father says I may have a swarm of my own next summer, and then I will commence business of my own.

C. M. INMAN.

Romeo, Mich., Dec. 7, 1882.

THE WELTY CHILDREN.

Pa has 39 stands of bees. He bought some of his hives of Scovell & Anderson, and some he made himself. We got about 1500 lbs. of extracted, and 1500 of comb honey. Pa uses the one and two pound section boxes, and the Novice extractor. I am 9 years old. I have never gone to school much, and never wrote at school.

CHARLEY WELTY.

Last summer I made section boxes for pa, and fastened comb in them. Pa is building a new house. I am 12 years old. This is my first letter. If I see this in print, perhaps I will write and let you know how pa gets along moving his bees. We are going to move about 6 miles from where we are now living.

MARY WELTY.

Medoc, Mo., Feb. 1, 1883.

Tell us how he got along, by all means, Mary. We want to know all about moving bees.

A LITTLE LETTER FROM MINNESOTA.

My pa has kept bees three or four years. We have 20 stands in our cellar now. I go to Sunday-school and day school. I am in the Fourth Reader. I have three sisters and two brothers. I like bees, but they don't like me. Ma has to live them sometimes when pa is not at home.

CARRIE LINK.

FROM 9 TO 20, AND 300 LBS. OF HONEY.

My pa had 12 swarms of bees last spring. Three got robbed, so we had nine yet, and increased to 22 and sold 2, and have 20 in the cellar now, all in Langstroth hives. We got 300 lbs. of honey, all in 6-inch square boxes. We have a cellar just on purpose for bees. We keep it at 38°. Minnesota is not a very good country for bees to make honey. We weighed all of our hives before we carried them into the cellar, and they averaged about 90 lbs. apiece, so they have enough to live through winter. If I deserve a book, please send me Ten Nights in a Bar-Room.

JOSEPH LINK, age 14.

Preston, Fillmore Co., Minn., Feb. 2, 1883.

A WARNING ABOUT WALKING CAREFULLY ON THE ICE.

My pa has 32 colonies of bees, all snugly packed in chaff. Last week a little boy ten years old in our school fell on the ice and killed himself. Little boys and girls should stay off the ice. I will send a card to Blue Eyes. I have blue eyes too. My pa's name is S. S. Pontious.

ALWILDA PONTIOUS.

Akron, Fulton Co., Ind., Jan. 22, 1883.

The card is a very pretty one, Alwilda. Your warning is a good one for us all. I fell down flat the other day, because I

walked heedlessly on the ice. I hurt my elbow, and had to walk all bent up for awhile. I walk real careful now, you may be sure.

#### JOSEPH AND HIS BEE-TREE.

Please send me a sample copy of GLEANINGS and price list. I found a bee-tree, August 8, 1882. I got one of the neighbors and pa to go with me. It was an elm-tree about 3 feet across. When it fell we could see them going in and out of a hole about 6 in. across. I got them home and put them in a hive. I have but one stand of bees. A man who lives about 2 miles from here found 3 more swarms on the same forty acres. That was doing pretty well, was it not?

JOSEPH H. OSBORNE, age 12.

Hopkins, Mo., Jan. 20, 1883.

Tiptop, Joseph, for a boy only 12 years old. Some of our older ones may take courage, when they hear what a boy can do.

Pa had 15 colonies of bees last spring, but five of them were so weak that they built up to make good swarms, only by the time the honey-flow ceased. He got 1500 lbs. of extracted honey, and increased to 30 by natural swarming.

#### HOW PA CLEANS HIS PAINT-BRUSHES.

When he gets done using them he puts some kerosene in a tin cup, and churns the brush up and down in it, and it cleans it as nicely as it was before it was ever used. Did you ever try it? Pa saw that I was so much interested in the JUVENILE, he gave it to me, and it pleased me very much. This is my first letter; and if you think I deserve a book, please send me Ten Nights in a Bar-Room.

JAKIE HUFFMAN, age 12.

Very good indeed, friend Jakie. I have never tried that way of cleaning paint-brushes, but I think the plan may be valuable.

#### FROM 15 TO 30, AND 1500 LBS. OF HONEY.

Pa has 30 stands of bees now, from 15 last spring, and extracted 1500 lbs. of honey, besides some comb honey. He keeps his bees in the cellar, out of the cold. It was 30° below zero yesterday. This is my first letter.

LIZZIE HUFFMAN.

Monroe, Green Co., Wis., Jan. 23, 1883.

#### A VISIT TO D. A. JONES.

Pa and ma were in Beeton, and had the pleasure of conversing with D. A. Jones. Well, that nice plant which you call blue thistle, he calls blue vipers. We have a lot of it growing on the road here, and the people in this vicinity do not know what to call it, so we will call it blue vipers. It is our best honey-plant. The answer to Hannah M. Smith's question is Leviticus 2:11; the answer to G. F. Greely, Proverbs 24:13. The answer to yours is Luke 24:42. Brother thanks you for that nice book you sent him. If I deserve a book, please send me Silver Keys.

SARAH J. SWITZER, age 11.

Fergus, Ont., Can., Jan. 22, 1883.

Don't you mean "Viper's Bugloss," Sarah? That is the common name for blue thistle, as given in the botany. Perhaps "Blue Vipers" has been corrupted from it.

#### RASPBERRIES AS HONEY-PLANTS.

Pa commenced the winter with 60 swarms of bees. They are all packed in chaff. He likes bee-keeping very much. We all help him as much as we can. He makes his own hives, and buys his sections in the flat. There are no boys in our family, so it

keeps us girls pretty busy in the spring. I have one sister older and one younger than myself. My age is eleven. We raise strawberries, and a few raspberries. Pa wishes he had acres and acres of them, for they are just alive with bees when they are in bloom. They are mostly red. I have got four prizes for being at the head the most in school; one for good conduct. Please give my love to Blue Eyes. I have blue eyes too.

MARY E. BARRETT.

Cherry Valley, O., Jan. 22, 1882.

#### SOME WISE COUNSELS FROM A YOUNG HEAD.

Papa thinks his bees are wintering nicely. They had a nice fly a few days ago, and no signs of dysentery. They are on summer stands, and in single-walled hives. I am next to the grammar room in school. We have a large playground in the front. We have some flower-beds. Mr. Green, the principal, is talking about fixing the front of the school-house up. He sent off for some flower-seeds. He has 12 kinds of seeds. You would not think of planting flower-seeds in winter; but if a farmer expects flowers in the summer, and sits around the fire all winter, I don't think he will have many.

D. BELLE LEWEDAG.

Wheeling, W. Va., Jan. 29, 1883.

#### FROM 15 TO 30, AND \$50.00 WORTH OF HONEY — AND SOME BAD LUCK BESIDES.

Pa has 30 swarms — 12 in chaff, and 18 in the cellar. Pa sold \$50.00 worth of honey this year, besides what we ate. He increased from 15 to 30 swarms. One day last summer, two hives swarmed at the same time, and alighted on the same limb. He held the swarming-box, and I climbed up the tree and shook the limb, and the queens went into it. He thought their wings were clipped. They were not, and they came pretty near flying away. Last summer pa and ma went to my uncle's, and six swarms got robbed. One day last summer pa and I went out, and the working bees were killing drones.

THOMAS E. STOCKS.

Nashua, Chickasaw Co., Iowa, Jan., 1883.

#### BE CAREFUL ABOUT SMOTHERING THE BEES; A LITTLE GIRL'S WARNING.

Papa has 11 stands of bees, and he lost two. They were big swarms, and papa found one of them. But it went away, and he did not find them, and the other swarm he did not get at all. He said he would give me a quarter every time I saw them swarm, and the same day I saw a swarm, so I got a quarter; but I did not see any more. While papa was transferring bees he had bad luck. They must have been just ready to swarm, for there were so many, and the box he smoked them into must have been too close; for when he went to put them in the new hive they were all dead; nearly a peck of them, I should think. This is my first letter.

MAY KELLER, age 8.

Mt. Vernon, Ill., Jan. 22, 1883.

#### HOW EDGAR'S FATHER FETCHED BACK A RUNAWAY.

We put 30 colonies of bees in the house this winter. One has died. We left eight out of doors on the summer stands, and packed them with straw. I read a great deal in GLEANINGS about other boys' and girls' bees running off. Our bees fly off. There was a swarm which came out and started off, and we followed them, and they settled on a tree. Father went to the house and got a frame and tied it to a stick and held it up in the swarm of bees, and they alighted on it. Then he took it and put it in the

hive. I have one colony of bees. My father likes his watch very much that you sent him. I help him with the bees. I often get stung. Father thinks that queen you sent him is a nice one.

EDGAR KENNEDY, age 12.

Mont Clair, Ind., Jan. 24, 1883.

Very good, Edgar, and *very nicely written*.

FRIEND WILTSE'S BEES, REPORTED BY ALBERT.

After uniting our bees in the fall we had 113 stands. Those in the large hives gather most honey. We now have the bees that are in large hives on the south side of a tight board fence. We put two thicknesses of cloth over the frames, leaving an opening over the center of the brood-nest for the moisture to pass through, and put cobs over the opening for it to condense on in cold weather. They fly out when the weather is about freezing cold in the shade. The sun so warms the hives that they fly out, and some of them fall on the snow and die. Those in the small hives we put in cellar, and shut in tight, Dec. 20. They are uneasy most of the time, and some of them get out and die on the cellar floor. All appear to be healthy. We have had some very cold weather. The thermometer indicated 20° below zero.

ALBERT WILTSE.

Falls City, Neb., Jan. 29, 1883.

WILLIE AND HIS PRINTING-PRESS.

I wrote a letter for the JUVENILE a month or two ago, about our bees, etc. Some of them are nearly covered with snow. It is pretty deep around here this winter, and also very cold. It has been 34° below zero here. I received one of your six-dollar printing-presses, a few months ago, and print cards. I have printed a good many now for friends and acquaintances. I send you one of my cards, which I printed on my press. I like to work with a press very much, and only wish I had a larger one.

WILLIE A. YOUNG, age 13.

La Salle, Ill., Jan. 23, 1883.

Why, Willie, I hardly thought it possible such a beautiful card could be printed by a boy 13 years old; and, to tell the truth, I was myself a little disappointed in those \$6.00 presses. I am very glad indeed you do so well with yours.

LINA AND HER POETRY.

My pa has 23 stands. I am taking music lessons. My mamma has children's meeting every Saturday at our house. There were two girls converted. I should like to have a book. Please send me "Ten Nights in a Bar-Room." I have two brothers, Willie and Johnnie. I had a sister, Euphima, but she died when she was three months old. I have been composing some poetry.

Winter has come, and it is cold,

And our honey all is sold;

Bees are snugly tucked away,

Waiting for the bright spring day.

LINA LANGTON.

Windham, Portage Co., O., Jan. 10, 1883.

One line about winter, two about bees, and one about spring. It seems to me, Lina, there is an "awful lot" of bees "waiting for the bright spring day."

MARY'S WHITE HIVE, ETC.

My pa has been a bee-keeper a good many years. He winters about 40 swarms every year, as that is as many as he finds profitable with his farming. We have 30 swarms outdoors in good chaff hives, and 10

in the cellar in single hives. Pa thinks the cellar is the best place for wintering, taking the winters as they come. I have one swarm of bees. My hive is painted white, and is in the cellar. Pa got a Holy-Land queen from D. A. Jones last summer, that he paid \$6.00 for, and he reared 17 young queens from her. Yesterday was a fine day, and some of our bees flew a good deal. Am I entitled to a book?

MARY MICHENER.

Low Banks, Ont., Can., Jan. 31, 1883.

To be sure, you are, Mary, and it does me lots of good to get a letter from a little girl belonging to my old friend Ila Michener.

FRED AND HIS MOTHER.

Mina is my adopted sister. She has lost both father and mother. She can go right among the bees. They don't often sting her. My mother and I are going to manage the apary this year. Mr. Barlow and Dr. Baker have been our bee-keepers till now. Our bees are all right so far. My pa has kept as many as 165 stands. He used to take GLEANINGS, and thought it was the best paper on bees ever published.

FRED WIRT, age 13.

I was so pleased to read my last letter in the JUVENILE! I will write about bees in the spring. I must tell you that I learned a nice piece about two good children, and spoke it at some friends' on New Year's day. If you would like it for the little girls and boys, I will send it to you. I also sung a song about "Jesus' Little Lamb." MINA WIRT, age 8.

Keithsburg, Ill., Jan., 1883.

Send the piece to us, by all means, Mina. Jesus wants all the little girls for his lambs, who have lost their father and mother.

WATERING BEES IN WINTER; FREDDIE'S ACCOUNT OF IT.

I THOUGHT I WOULD WRITE YOU A LETTER. I HAVE A BROTHER CHARLIE, SIX YEARS OLD. WE WHEEL PAPA'S WOOD IN THE WOODHOUSE, ON A WHEELBARROW. MY PAPA HAS 106 SWARMS OF BEES. PAPA GOT A BLACK MAN AND A WHITE ONE TO CARRY THEM INTO THE CELLAR. I GO DOWN TO SEE THEM SOMETIMES. PAPA POURS WATER ON THE CELLAR BOTTOM. HE SAYS THE BEES LIKE THE MOIST AIR. THE BEES STAND AROUND A PUDDLE OF WATER, AND DRINK WHEN PAPA GIVES THEM SOME. I HOPE YOU WILL LIKE MY LETTER, AND WILL PRINT IT, AS IT IS MY FIRST ONE. CHARLIE AND I GO TO SCHOOL, AND TO SABBATH-SCHOOL.

FRED G. MASON, AGE 8.

FABIUS, ONONDAGA CO., N. Y., FEB. 1, 1883.

I like the letter first rate, Freddie, and I should like ever so much to see the bees drink out of that puddle. Tell us if they winter all right, won't you?

BERTHA TELLS US ABOUT HER PA'S BEE-KEEPING.

My pa keeps bees. He began four years ago, with two swarms of blacks, which he bought in old "box" hives. He put them into some patent hives which he made, and in two years he had but four swarms, and no honey. He knew nothing about the improved way of handling them until he got one of your A B C books, and ma said that he could not make a hive from your description; but he did, and they looked nice too. He sent to you for frames and sections in the flat, and I helped him to put them together. A good many around here came to see how

to make them. He did not get much honey the following year; but last year they did better. He got 150 lbs. of surplus honey, and has eight swarms in the cellar, doing well. He sent and got an Italian queen and a pound of bees last summer, and his bees are half hybrids or Italians. The poor little blacks are getting crowded out, just as we white people have crowded out the poor Indians. Pa is very fond of bees. He is in hopes to have better luck next time. He thinks a great deal of GLEANINGS, and reads it out loud to us. This will be a surprise to pa.

BERTHA E. NELSON, age 12.

West Stockholm, St. Law. Co., N. Y., Jan. 20, 1883.

DRONES FROM WORKER EGGS; BY A 14-YEAR OLD JUVENILE.

Will you allow a little girl fourteen years old, who has done much work about the apiary, to speak of what has come under her own observation relative to the workers changing the sex of the egg? For five or more years my father and I have raised many queens for our own use and that of our neighbors. Last year we bought about 15 hives of black bees, with the object of seeing how many Cyprian hives we could make from them; and in order to do it we proceeded in the following manner: The black queen and unsealed brood were previously removed, and in their place we put fdn. Then Cyprian worker eggs, about one day old, were placed in the center of about one-half bushel of bees. Now listen to the result: In almost every case, where no Italian drones or drone brood was placed, and after the queens and workers were hatched out, there were Cyprian drones to hatch; and in order to satisfy myself that no mistake was made, I pulled them from the cells and examined. Say to Mrs. Harrison that I can do more hard work in the apiary than lazy men. If I am entitled to a book, please send Ten Nights in a Bar-Room.

ISABELLA WIER.

South River, A. A. Co., Md., Jan. 31, 1883.

We are very glad of your testimony, friend Isabella, and I am very glad indeed to know that you are not only reading, but working understandingly. Go on, and let us hear from you more.

The following I copy from the *Christian Advocate* of Jan. 4, 1883:—

Tobacco is an evil weed,  
And from the devil did proceed;  
It spoils your breath and soils your clothes,  
And makes a chimney of your nose.

Would you give me a book, if you think I deserve it? I try to be a good little girl. Send me Pilgrim's Progress.

JESSIE S. WIER, age 8.

South River, Md., Feb. 1, 1883.

May God bless you, my staunch little friend Jessie, for your little verse. If you don't deserve Pilgrim's Progress, I don't know who does.

A LETTER FROM IOWA, WITH A GREAT DEAL OF NEWS IN IT.

My father has 19 swarms of bees. They made over 1000 lbs. last summer. My brother has two of them. One made 176 lbs. They would have done much better if the spring had not been so hard on them. We extracted considerable in the busiest time of the honey harvest. It kept us busy to keep them busy. We thought it best, seeing they were so weakened by the cold wet spring. When they swarmed we would go to the hive and cut out the queen-cells and put the new swarm right back where it came from. We thought we would have stronger colonies

and more honey by doing that way. Don't you think so? Mother thinks honey is just as good as sugar for sweetening a great many things, and even for sweetening tea and coffee. The bees are all in the cellar now, and they seem quite happy. The thermometer has been 24° below zero twice. I rather think they enjoy 40 above rather than 24 below, out in the snow. There was an owl frozen in our school coalhouse, and two little quails under the schoolhouse. The teacher took the wings to put on her hat. There was a freight train wrecked by a broken rail half a mile south of our house; eight cars were thrown from the track, and badly broken up, and corn and wheat thrown out among the snow, but no one hurt.

A. MAY PROVAN, age 11.

Traer, Tama Co., Ia., Jan. 25, 1883.

KIND WORDS FROM OUR CUSTOMERS.

The Story of the Bible came to hand all right, and the children are well pleased with it.

Barbour's Mills, Pa., Jan. 5, 1883. ANN SCAIFE.

The hives have come to hand. I think they are about right. That is the way my mind runs at present.

W. W. TURNER.

Oak Hill, N. Y., Jan. 29, 1883.

OUR JOB PRINTING.

The circulars and envelopes just came to hand, and I must say they were very nicely done.

Linden, Mich., Jan. 24, 1883. L. E. WELCH.

"Waterbury" received, and GLEANINGS started for a year, according to your offer for \$1.00. Thanks; the watch is worth the money alone. It seems to be as good a time-keeper as the best.

H. KINGSBURY.

Lockport, Niagara Co., N. Y., Feb. 3, 1883.

This March journal has got so dirty that I am ashamed to send it. I have two small children who have to read my journals after I do.

NELSON HUBBARD.

South Strafford, Vermont, Jan., 1883.

[Never mind the dirt, friend H., if you can only get the children to reading them.]

I can say, that I have always had better satisfaction in getting goods from you than from any other place. Those 24-lb. scales I purchased of you are reliable, and will stand the test by the side of high-priced scales here in the stores. They were going to charge me \$5.00 at the hardware store here for second-hand scales weighing only 10 lbs., but I could not see the point, when new ones weighing 24 lbs. cost me here only \$5.35.

GEO. P. HOWARDS.

Marion, Wayne Co., N. Y., Jan. 20, 1883.

STORY OF THE BIBLE.

I am well pleased with "Story of the Bible." I would much rather place it in the hands of a child than any of the books filled with made-up stories. It makes a first-rate Christmas present for any child who can read in one syllable.

Bellmore, Ind., Dec. 25, 1882.

CYMS GOSS.

[I believe your opinion is the general one, friend G. We have had a very large trade on the book, and one customer sent right back for another just as soon as he saw what a very large nice book it was for so small a sum of money.]

I shall try to do without GLEANINGS this year, and we will be good friends still; of course, we will; if not, why not?

C. W. LEAH.

Spanish Fork, Utah, Jan. 23, 1883.

[I really hope that nothing will happen to prevent our being good friends still, friend L.; but I am going to try to have so much that is good in GLEANINGS, that you will hear your neighbors tell about it, until you can't stand it without it; and then I hope, too, that the children may all take such a fancy to this little bee journal that they may all be telling about it. And, by the way, friend L., don't you have some little folks around your house too?]

# Juvenile Gleanings.

There is none other name under heaven given among men whereby we must be saved.—ACTS 4:12.

WOODEN separators for L. frames, for only 50 cts. per 100, or \$1.00 per 1000. We are turning out beautiful ones to-day.

We can not sell alike for less than \$12 now; if any of the friends have any to dispose of, we should be glad to see sample, and learn the price wanted for it.

UNTIL further notice, I will pay 30 cts. cash, or 32 trade, for fair wax. As I may not be able to buy for 32, or even 35, I dare not take orders for less than 36c; and if you want selected wax, 40c.

THERE is such a multitude of juvenile letters ahead now, I don't know but I shall have to keep the old folks out of the next number entirely, and have a sort of "children's meeting" of it entirely.

THE sap is running some to-day, and we expect new maple sugar in less than a week. We have just got hold of a very pretty maple-molasses can that we can furnish for 15 cts. each, \$1.20 for ten, or \$11.00 per hundred. They hold a gallon, and have a sort of bail, or handle, to carry them by. As they hold from 11 to 12 lbs., it makes a very pretty honey-pail also.

### RYE AND OAT MEAL.

THE time is now at hand when we can feed artificial substitutes for pollen. Friend Muth advertises pea flour, we notice, but we have never seen bees take to any thing as they do to oat meal and rye. For the convenience of our friends who have none at hand, we will furnish it, freshly ground, for 5 cts. per lb. If wanted by mail, 18 cts. extra, for bag and postage.

It is astonishing to know how low an article can be furnished, when the demand for it is large and unlimited. A machinist could hardly make a single wood screw by hand for 25 cts.; and yet we are now able to sell a whole gross of beautifully made steel screws for the small sum of 10 cts. We can furnish four sizes at this price —  $\frac{1}{4}$ ,  $\frac{3}{8}$ ,  $\frac{1}{2}$ , and  $\frac{5}{8}$  inch;  $\frac{3}{4}$  in. will be 15 cents per gross. If wanted by mail, postage will be 2, 3, 4, and 5 cts. each respectively. What excuse can we have now for having work come to pieces?

### A WATCH FOR FIVE SUBSCRIBERS, AGAIN.

We have quite a few Waterbury watches of series "A" on hand, that we will sell at \$3.00 each, or give one for five subscribers at \$1.00 each. Or, if you choose, a watch to any one who pays for five years in advance. This is the same offer and the same watch that we gave in this way a year ago. The only reason why we make the offer is, that the new watch, series B, has rather thrown it into the shade. I need hardly say, that these watches are regulated and tested by being carried.

C. P. DADANT.

We were recently favored with a pleasant visit from Mr. C. P. Dadant, of Hamilton, Ill. The Dadants have been having an immense crop of honey the past year, and they have just sold Thurber one lot of 20,000 lbs. at 10 cents. I have lost the figures, but I think their crop was something near twice that amount.

At one of our young people's meetings we had a new minister preside one evening, and his remarks at the opening occupied just half of the hour we have for the services. After he gave the meeting into the hands of the young people, another good brother spoke 15 minutes, and then it was almost time to close, and the young folks had hardly taken any part at all, although it was a young people's meeting. Do you want to know what that has to do with us? Not much, only the length of some of our good letters of late is rather troubling me. One very good friend of mine has written 50 pages, and some of the rest have letters almost as long, lying by my side unread. What shall I do?

SEVERAL of the friends have felt a little hurt because we have pretty vehemently insisted on the settlement of small amounts, which they were intending to send in when they made their next order. This is all right, friends, if you only say so. Just write to the book-keeper that the account is "O.K.," and that you will settle it so and so, and I assure you we shall be satisfied; but if we don't get any reply, how are we to know what you propose to do? Surely you can not think we ought to have little balances standing all over the world, without knowing any thing about it. You see, we are compelled to do things by *system*, and can not trust to memory, as we might do with a limited number of customers.

### HOW TO SUCCEED IN BUSINESS.

THERE are all the time among our readers young men who are starting out in business for the first time. Many are starting in the supply business, and, I am sorry to say, quite a few who start do not succeed. Why is it? Is it because there is not room enough for all? I do not think that is the reason. Is it because they do not work hard enough? In one sense; but I do not think that is quite it. Some people work *very* hard, and do not *get* along either. Do you wish to know the secret? It is in making everybody satisfied, and doing every thing not only to the full letter, but to the full spirit of your promise. Now I tell you, boys, this is all in all. In looking the world over I have been surprised and astonished at the reward that comes from faithful service. I am also surprised and astonished to see how soon one who indulges in little evasive tricks is left with nothing to do. What I mean is, that although I should expect a man would not thrive who would twist and slip out of his promises just for the sake of a few cents, I am astonished to see how soon he reaps the reward of his short-sightedness. Or, to come a little closer home, when I yield to the temptation to be a little crooked in deal, it surprises me to find *how soon* trouble comes. Selling things low doesn't always bring business. You may put good prices on things, if you choose, if you are only careful to do *all* you promise. Do not only *all* you promise, but do all that any construction of your advertisement may promise, and then see how quickly it shall come to pass, "With what measure ye mete, it shall be measured to you again."

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

**\$1.00 Queens.**

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

ITALIAN BEES FOR SALE!**

**H. NEUHAUS,** 3d  
Burlington, - Racine Co., - Wis.

**XXX**

For the next thirty days I will book orders for dollar queens to be delivered in July or August, at seventy-five cents each. Single queens to new customers, fifty cents. No order for over five queens received from any one party. I am a new man to many of you. Give me a trial.

3d **C. M. GOODSPEED,** Thorn Hill, Onon Co., N. Y.

**SEND 10 CENTS** and get a large package of Mixed Flower-Seeds, containing over 25 of the choicest kinds; and 25 cents for 10 packages of Garden Seeds. Name some desired (except beans, corn, and peas), and I will send if possible. All the above for 30 cents. Parties sending one dollar during this month for an Italian queen, sent in July, will receive the above free by return mail. Send for Price List of Seeds. **J. G. LEHDE,** Gardenville, Erie Co., N. Y.

**WE** will work wax on shares, one-half for the other, for anybody who will send it to us, and pay freight both ways. **A. R. NISBET,**  
3d Dobyville, Clark Co., Ark.

**20 GOOSEBERRIES** by mail, \$1.00. Good roots; Houghton's seedling; bears well; produces honey very early. Address  
**CHAS. KINGSLEY,** Greeneville, Tenn.

**WANTED.**—The management of an apiary in Northern Ohio, or perhaps in other States.  
3d **HENRY GRAHAM,** Port Perry, Ont., Can.

**Sweet-Clover Seed.**

New and clean, 25 cts. per lb.  
1-4 **BEN CLENDENON,** Grinnell, Iowa.

# Honey Column.

## CITY MARKETS.

**CINCINNATI.—Honey.**—No change whatever from last month in the market for honey and beeswax. There is an abundance of comb honey in our market, of choice quality, for which there seems to be no demand. We have offers from commission houses at almost any price. There is a good consumptive demand for extracted honey. We had the highest water known in the history of Cincinnati. Water went into the 2d and 3d stories of houses; hundreds of frame houses were tilted over or upset in the lower part, and the outskirts of the city. We are, fortunately, above high-water mark.  
Cincinnati, O., Feb. 21, 1883. CHAS. F. MUTH.

**DETROIT.—Honey.**—There is but little doing in the honey market, the demand being very light. Good white comb honey is offered at 17@18 cents; dark, at 14@16 cents, but no buyers.  
Beeswax is scarce; quoted at 30 cents.  
Detroit, Mich., Feb. 23, 1883. A. R. WEED.

**CHICAGO.—Honey.**—Honey is very slow sale; prices are nominally the same, and the supply is plentiful.  
Beeswax is just the reverse. I am paying 30 cents cash on arrival for good yellow wax, and 17@25 cts. for dark and off colors.  
Chicago, Ill., Feb. 21, 1883. ALFRED H. NEWMAN.

**CLEVELAND.—Honey.**—Honey has been exceedingly dull during Jan. and Feb. It is only within a week that any sales have been made, at prices ranging from 19@20 for white 1-lb., and 18@19 for white 2-lb. sections. Extracted still moves very slowly at 10@12.  
For beeswax we have many inquiries, but no wax.  
Cleveland, O., Feb. 15, 1883. A. C. KENDEL.

**BOSTON.—Honey.**—We quote you white one-pound comb honey, 25c.; two-pound do., 23c; dark not wanted. Extracted, slow sale. We have no honey on hand of any amount; our market is almost entirely gone from first hands.  
Boston, Mass., Feb. 23, 1883. CROCKER & BLAKE.

**NEW YORK.—Honey.**—In reply to yours of the 20th inst., permit us to quote honey as follows:—  
Best white, in 1 lb. sections (no glass) per lb., 21 to 23.  
" " " 2 " " (glassed) " 20 " 22.  
Fair " " 1 " " (no glass) " 19 " 20.  
" " " 2 " " (glassed) " 17 " 18.  
Buckwheat, " 1 " " (no glass) " 17 " 18.  
" " " 2 " " (glassed) " 14 " 15.  
White-clover extracted honey, in small bbls., 9@10.  
Buckwheat " " " " " 8@8½.

**Beeswax.**—No beeswax to quote.  
Feb. 26, 1883. H. K. & F. B. THURBER & Co.  
I have six 55-lb. kegs of white extracted honey—3 of clover, 3 of heart's-ease. Will put on ears for 9c. per lb.  
Bloomington, Ill., Feb. 14, 1883. R. J. BARBER.

I have 3000 lbs. of honey, basswood and clover, all warranted to be first class, in kegs, which I will sell at 10 cents for basswood, and 11 cents for clover, delivered on board the cars here, or at Monticello. Kegs hold 115 lbs.  
Cascade, Ia., Feb. 26, 1883. MONT WYRICK.

## A GOOD HONEY - PLANT.

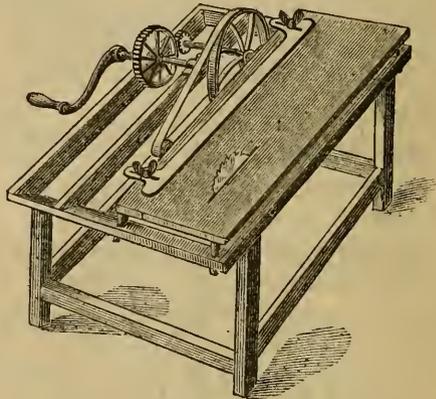

100 BUCKTHORN-TREES by mail, postpaid, \$1.00. Address CHAS. KINGSLEY, Greenville, Tenn.

**PATENT FOX MILLS.** | 6-inch, \$10.00.  
| 10-inch, \$15.00.  
2fd WM. C. PELHAM, Maysville, Ky.

## NOTES FROM THE BRIGHT-BAND APIARY.

FRIEND KINGSLEY'S ADVERTISEMENT, NO. 1.

HERE are two things a great many of us need, but are without, on account of the high price generally asked for them, and that is, a hand-power buzz-saw and extractor. By proper management I am able to make and furnish either at a much less sum than is generally asked. I will first give you a picture of the saw.

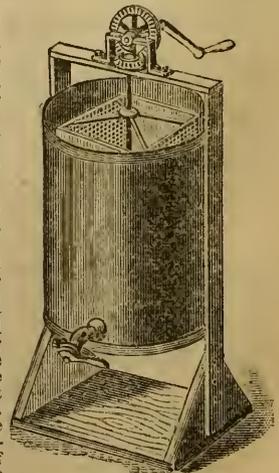

PRICE \$25.00.

I am glad of having the privilege of bringing this saw before you all, as I have never seen any thing that would equal it, either in rapidity or quality of work. It is very handy, as one hand can do the turning and sawing too, and, at the same time, is not very hard work, unless you get into a "big" hurry. The whole thing is gotten up in first-class workmanlike style, and all you have to do when you get one is to put the crank on and go to sawing. Seven-inch saws will be used, unless some other size is ordered. All who have hives, queen-cages, section boxes, etc., to make should order one before spring.

And now for the extractor.

This is made very much on the style of Novices, only it is set in a light but strong wooden frame, which makes it convenient to set almost any kind of a vessel under to hold the honey, and about the right height to "save one's back." It also makes the gearing stronger.

Now, friends, both the saw and extractor are gotten up in first-class workmanlike style, and I shall take pride in trying to please all. Price of saw, \$25.00. Same for power, without hand-gearing, \$15.00. Will make a machine for dovetailed sections to set on top of the saw-table, and to be run by the same belt, for \$10.00. Price of extractor, any size not larger than for Langstroth frame, \$5.75; for a larger size than this I shall probably have to charge a little more.

PRICE, \$5.75.

Very truly yours, CHAS. KINGSLEY.  
Greenville, Greene Co., Tenn.

**For Sale.** Colonies and Nuclei of Italian Bees, Queens, Extractors, Bee Books, and Supplies. Address OTTO KLEINOW, 3fd opposite Fort Wayne, Detroit, Mich.

Vol. XI.

MAR. 1, 1883.

No. 3.

*Publisher and Proprietor,*  
Medina, O.

Published Monthly.

*Established in 1873.*

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Number, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POST-OFFICE. Clubs to different postoffices, NOT less than 90 cts. each.

**NOTES FROM THE BANNER APIARY.**

NO. 40.

**AMONG THE BEES AND BEE-KEEPERS OF MICHIGAN.**

**I** HAVE just returned from a visit to some of the most prominent apiarists of this State; and thinking that a description of their apiaries and methods might be interesting to the readers of GLEANINGS, I venture to send an account of the trip. MR. J. H. ROBERTSON'S APIARY.

First upon the list of bee-keepers is Mr. J. H. Robertson, of Pewamo. Mr. R. commenced bee-keeping about 20 years ago, when log gums and box hives were the rule, and the getting of honey by having it stored in large boxes placed upon the tops of the hives was considered the *ne plus ultra* of perfection.

**A ONE-ARMED BEE-KEEPER.**

Although friend R. left his good right arm upon a Southern battle-field, he did not leave his Scotch determination and will; and the misfortune that would have dampened the ardor of most bee-keepers seemed only to spur him on to greater efforts. I have been informed that friend R. can handle bees as rapidly with his one hand as many bee-keepers do with both; and after passing two days in his company I can easily believe it, as he gets about and handles everything so easily and rapidly that I sometimes really forgot that he had only one hand. He has owned as many as 500 colonies at one time, and obtained as high as 30,000 lbs. of extracted honey in one season. Although others may find that the production of comb honey is the most profitable, friend R. feels certain that extracted honey is the most

profitable for him to raise. He says, that if he does not extract the honey, his bees get the swarming fever, and he loses all control of them in this respect.

**THE RAILROAD ARRANGEMENT.**

His lines stand in long rows, and he has a track upon which to run a car for carrying hives, colonies, honey, etc., to and from the apiary.

**A MODEL WINTERING CELLAR.**

At one side of the track stands his wintering cellar, which it will scarcely do to pass without a description. It is perhaps 16 feet wide by 40 feet long, outside measurement. First an excavation, 3 or 4 feet deep, and as long as the inside of the cellar, was made, then two walls of boards, 6 or 7 feet high, and about 3 feet apart, were built around the outside. The space between the walls was filled with dry earth, a covering of boards or planks laid over the cellar, and then a roof of boards over the whole. The chamber floor was made frost-proof by covering it deeply with sawdust. The cellar is ventilated by one or more tubes passing up through the chamber floor and its covering of sawdust. A thermometer is let down, by means of a string, through a tube that passes through the sawdust and chamber floor. The thermometer can be drawn up, and the temperature ascertained at any time without entering the cellar. Friend R. says that the temperature is very even throughout the entire winter and spring. The cellar is furnished with double doors.

**RUNNING WATER IN A WINTERING CELLAR.**

At one end of the cellar is a spring that usually causes a stream of water to flow through the cellar; and at the time of my visit it was not furnishing any water, and friend R. shoveled bushels of snow into

the cellar every few days. The snow gradually melted, and kept the air fairly loaded with moisture. There were 350 colonies in the cellar, and I tell you they were in splendid condition. By the way, I will say that friend R. saves out combs of early-gathered, well-ripened honey, to give the bees when preparing them for their winter quarters. He numbers each hive in the fall, and each stand is furnished with a number corresponding to the hive that is taken from it; and he is particular, when carrying the bees out in the spring, that each colony shall be placed upon its old stand. He says he has had the bees mix up badly, and lost many queens by setting the hives out promiscuously.

Friend R. has a Dunham fdn. mill, but thinks seriously of discarding it for a Given press. He considers the making of fdn. as hard, disagreeable, and particular work; and were it not for the fact that the work can be done at odd spells, and that freight charges and delays are avoided, he would buy his fdn. instead of making it.

#### THE L. FRAME.

He uses the Langstroth frame, and says that, even if he did not like it any better than other frames, he would use it simply because the majority of bee-keepers use it; the bees being more salable, and supplies being more readily obtained.

#### A RAID AMONG THE BEES, AND HOW IT STARTED.

He gave me a very graphic account of how the exposure of an open crate of honey in front of a store had so aroused his bees, that for a day or two the business of the town was almost suspended; every building had to be shut up "bee tight." He immediately commenced feeding his bees, and in this manner drew them away from the town, and finally got them under control.

Friend R. hitched up "Johnny," and we drove out about three miles to see a bee-keeper by the name of Balch. Mr. B. has a bee-cellar similar to Mr. R.'s, only smaller. Mr. B. shoveled the snow away from the door, and we entered. If I remember rightly, there were about 40 colonies in the cellar, only two of which showed any signs of dysentery, and that only in a slight degree. The cover was removed from a strong colony near the door, and some of the bees flew out of doors.

#### DO BEES REMEMBER THEIR LOCATION OVER WINTER?

When we left the cellar, Mr. B. called my attention to the fact that these bees lay kicking upon the snow just under the plum-tree where their hive had stood; these bees certainly remembered the location of their old home.

#### ALSIKE CLOVER.

Alsike clover is largely grown near Pewamo. We visited one man who had 500 acres of this clover. Mr. R. advises the pasturing of alsike until the latter part of June; it will then blossom just after basswood, and will yield two crops — one for honey and one of seed.

In addition to the bee business, Mr. R. is largely engaged in the stave business. We intended to visit friends Roop and Goodno, of Carson City, but the storm prevented.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., Feb. 1, 1883.

(Concluded next month.)

Friend H., that was a wise "speculation" of yours, in going to see friend Robertson; and not only for you, but for the rest of us. — You have dropped a hint in regard to a running stream for keeping a cellar cool, and

for keeping the air at all times at the proper degree of moisture, that is new to me. Shall we not follow it up? — I wish the man who has 500 acres of alsike would sell us some seed. It is now worth \$15.00 a bushel, and, what is worse, like the beeswax trouble, I don't know at present where we can get any more at any price. If any brother has any, will he please speak out?

#### MRS. HARRISON'S LETTER.

SOME SUGGESTIONS FOR BEE-KEEPING WOMEN TO AVOID MOVING HEAVY HIVES IN SWARMING-TIME.

IN GLEANINGS for Feb., Cyula Linswik requests me to tell how I manage. I have not strength to move "heavy hives," so I let them alone. My endurance is greater than my strength; and if bee-keeping required such an outlay of it as to move heavy-laden hives, I could not keep bees. I infer that the sisters Linswik clip their queens' wings, and then remove the old hive, putting a new one in its place, knowing that the colony will return as soon as they find their queen is not with them. This may be as easy a way as any other when there are two to do the lifting; but certainly not, where there is only one. We have never clipped queens' wings; and when our bees issue, they cluster. Hives are prepared for colonies, and placed in different parts of the apiary, and we shake them down into a large dish-pan, and pour them down before the hive which is nearest to where they clustered. Very few of our bees have ever clustered very high, and it is rare that any have crossed the street before clustering. Last summer I was alone, and a colony clustered in the top of quite a large cherry-tree. I went up on a step-ladder, and tied a long clothes-basket, with a handle at each end, directly under the cluster. I then got a long strip of pine, such as are used for battens, and drove a nail in the end, and ran it into the cluster, catching hold of a limb, and then shook the bees off. A good many fell into the basket, and I suppose the queen was among them, for they all gathered in and upon it. I have never seen the Brooks swarm-catcher, I believe.

Josh Billings says that he always likes to know what kind of advice a man wants, before he gives any; but I feel as though I must put in a word. Two ladies, owning 75 colonies of bees, could afford to be liberal with their help; and if they would offer three, four, or even five dollars per week for the months of June, July, and August, it would be better than selling their bees. I said to a friend this fall, "You have excellent help;" and the reply was, "The way I obtained this splendid worker was by offering more than any one else is giving."

I love to work, and I am not happy unless usefully employed. But there are kinds of work that do not agree with my health or feelings, such as sewing, or cooking over a hot stove in warm weather. I have this work done by proxy, much better than I can do it, and at the same time benefit others by giving them employment. The girl who does the housework screeches if a bee flies into her domain, and I thought the dressmaker was going to church when I saw her out in the yard with her hat, veil, and kid gloves on. Yet I enjoy working in the fresh air and sunshine, with bees for company; and my

husband says if he ever gets to heaven he expects to see me coming along with a bee-hat on, and smoker in hand.

Whether bee-keeping is too hard for women, should be viewed from different standpoints, as we are so apt to measure other people's wheat in our own half-bushel. As an illustration, when I was at the North-Western Convention at Chicago, several bee-keepers spoke disparagingly of my bee-hat; but if my head could be changed to their shoulders, they might think differently. By putting on a wet head-cap, and an airy wire hat, I can work safely in the hot sun, when it would be rash to go out without it, as I have a tendency to apoplexy, and my head would feel like bursting, with a hat and veil.

I do a good deal of headwork, planning to have the work as light as possible during the busy season. All of the plain sewing, such as the making of calico dresses, underclothing, aprons, sun-bonnets, etc., is done during the winter. The house is cleaned early; and when the closets are overhauled, and paper-rags picked up, the suitable ones are rolled up and tied for fuel for smokers—plenty to last during the season. Gloves are mended, wire hats put in order, and, as the season advances, hives are put in position for new colonies. It is true, that during the busy season I have little time for visiting, but I make up the lost time during the rest of the year. I have made money and I can afford to attend a bee-convention, or take a trip to the mountains or seashore. From my standpoint, it seems as though the sisters Linswik, with their eleven years' experience, and the amount of bees they have, ought to clear a thousand dollars per year. By taking time by the forelock, and securing help, one at a time might skip off to the mountains for rest and recuperation; and at the close of the season be fresh and vigorous with plenty of spending-money.

I want to say to Cyula, before closing this article, when you talk of selling your bees, *don't*; but if, in spite of my protest, you shall persist in so doing, it will not be the least of my regrets—the losing from among our number one who wields so gracefully a pen as Cyula Linswik.

MRS. L. HARRISON.

Peoria, Ill., Feb., 1888.

I warmly second your concluding words, Mrs. H.; and in regard to hiring good and efficient help, I would say that we sometimes make a mistake in using too much economy. I have several times felt as if I really could not afford the price that some good man wanted; but I soon found out that it was a plain saving of money to pay a good, honest, faithful hand enough to make him feel happy, and with it a determination to work hard for my interests. Somebody has mentioned that Mrs. Axtell's honey crop will net over \$5000. Just think, Cyula, how much good you might do in your own neighborhood by giving employment, and developing the latent talent that lies slumbering about you. No, I am not mistaken. Over and over again have I seen a little kind care and teaching bring out intelligence that surprised the neighbors, and the one that possessed it, more than anybody else, perhaps. Just look about you now, until your eye catches on some child that is hungry for work, and then accept the charge as a commission from the loving Savior, and teach that child as you would if the Master had said to you direct, "Inasmuch as ye do it unto her, ye

have done it unto me." When the child begins to take hold, and feels proud and happy because she is succeeding, and tries to show her love and gratitude to you by kind looks as well as kind offices, you will feel a thrill of joy that nothing else in this world that I know of can equal. If you have trials and perplexities and discouragements, let them serve to drive you to the Master, and blessings of all kinds will come as surely as the rising of the sun.

Are those who write the bright little letters in our JUVENILE GLEANINGS any smarter than the boys and girls in the vicinity of your own home? Surely not. To be sure, every child may not have a taste for bees, and one therefore would need to exercise a little wisdom in selecting one for trial; but give me the boys or girls who like work, and whose circumstances make it needful that they should have work, and I have seldom failed in enlisting their enthusiasm. While they do manual labor, also teach them to do writing, and to thus get hold of the machinery of the great busy world. I have been addressing these words to Cyula; but, my good friend Mrs. H., they will apply to you too, although you have started out a little in that direction; and not only you, but a thousand others who have got where they can see how great is the harvest, and how few are the really conscientious, intelligent laborers. It is our own fault, friends. The material lies all about us, and it is, to a great extent, *our fault* that it develops into selfishness, and sometimes even crime. "Ye are my witnesses."

#### SOME OF OUR GREAT HONEY-PRODUCERS.

TAKING A LOOK AT THEIR FACES.

FRIEND BLANTON is not only a big bee-man, but he is a big man as well; and he is not only big in body, but, like all other big bee-men, he is a big-hearted, jovial fellow. When at Cincinnati, he, with friend Jones, Muth, and neighbor H., almost made me feel small. Besides that, while we were riding around the city they actually went to laying traps for my innocent and unsuspecting country feet. You see, we passed a big shop where they had barrels and hogsheads and tierces of something that I thought might be beeswax (I declare, I wish it were beeswax now), but it wasn't beeswax at all; it was only tobacco, and friend Jones said it would ruin my smoker business, sure, and I might just as well give up, for they would make tobacco a good deal faster than I could make smokers. And then after a while friend Blanton said, very soberly and solemnly, that he had a great notion to give up the use of tobacco; and then friend Jones gave him a long brotherly talk about the evils of the weed, and about his influence and example, until he finally declared he would give it up, if I would give him a smoker. Friend J. then made a few closing remarks about always feeling happy when he was able to induce any one to give up a bad habit; and there

those big chaps were all the while laughing in their sleeves, because friend B. had *never used tobacco at all*. Never mind; I forgive them, and here is the picture of the man who has sold friend Muth pretty well toward a hundred barrels of beautiful honey, as the product of his own apiary, in a single season.

DR. O. M. BLANTON, THE HONEY-MAN OF THE SOUTH.

He lives in Greenville, Miss.; and if you don't believe his honey is nice, when you take dinner at the lunch-room next time, just ask for some of the palmetto honey. You see, friend Muth sent me a whole dozen jars of it, and I keep it to give bee-friends; and if friend Muth will send us a photo, we will have a look at his genial face next time; won't we, boys?

### WHO SHOULD KEEP BEES?

SOMETHING ABOUT OVERSTOCKING, ALSO.

**FRIEND ROOT:**—May be you're not my "friend;" but as long as you claim me for yours I shall hold on to you. Several years ago I entertained and freely expressed (that is, as freely as the papers would let me) some conservative ideas regarding who should keep bees. Since that time I have not changed my mind regarding my conservatism; for facts coming up from time to time have forced me to hold the closer to my former conservative opinions. Since that time there has been a great change of belief regarding this question, and how much we should urge others to become bee-keepers; and also a clearer understanding of my former ideas upon the subject. Illustrative of this, compare my former articles with the recent one of Dr. C. C. Miller, in this year's *A. B. J.*, page 36. Here is a man whose head and heart none can be induced to doubt. Now you realize (see last GLEANINGS) that localities can readily be overstocked, and all can then readily see how important it is that every apiarist have the *whole* pasturage of the area

in which his bees work — an area of about six miles diameter. Now, is it not just, honorable, yea, even a duty to you and yours, and much wiser as well as better for all concerned, that we do *not* "rush in after the neighbors" to come and see the "wonderful" results of a bountiful season?

Is it not true, that while we might at once influence them with the large profit of our summer's capital and labor, it might take more time and effort than we possess to show them that these results are above the average; that seasons of study, experiment, and losses, have been experienced, to get the knowledge which forms the greater factor making up this success; to impress upon their minds that no two apiarists can both realize such a yield in one field; that we know, that, if they should keep bees "just over the way," such bee-keeping would be a direct damage to us (as for economy, we wish to keep all the colonies our field will support); and while their bee-keeping is to us a damaging influence, *ours* will prove *ruinous* to them. Why should we labor to do justice, when silent rest will accomplish the same result?

In years past, some tried to answer these arguments by pointing the finger of scorn. While this sometimes silences the one who argues, it *never* replies to his arguments; and sooner or later they arise and demand logical answers. When we were told that our business was exceedingly profitable, and eminently adapted to invalids, children, and women, I thought that was a slur on those succeeding in the pursuit, and a rather poor classification for the ladies. I said so, and at the expense of being misunderstood, and consequently condemned, by the gentler sex.

Were I keeping store, and an agent should appear with a new article of merchandise, and say, "Oh! it's a big thing; profits are enormous; sales are immense; you can sell thousands in this village," I would, were I persuaded to think so, say, "Who else here are you going to convince of this, and sell to?"

Suppose I tell farmer Jones, in township 2, that, with my patent hive (as there are no bees in the township) he can realize large profits on an apiary, and then I go to 3 or 4 of his neighbors and tell them the same thing, and get all of them started in business once based on fact, but that I told so many times it is now based on falsehood, what would Jones say? What ought he to say? If you should tell me, "Oh! say bee-keeping is just a bonanza," I would be expected, by this practical world, to say, "Well, well, I see it; just you keep still now, and don't 'kill the goose that lays the golden egg.'"

One alluring and deceptive fact connected with bee-keeping is, that a few colonies pay much better, pro rata, than a number sufficiently large to make the business a profitable specialty. "One colony of bees paid me \$43.28," says one.

"Well, what of it? that won't buy your clothes, nor board you for a year."

"Yes, but I'll have 100 colonies; see here: \$4338." Comment is unnecessary.

Well, does this argue in favor of mixed production, and keeping a few colonies? Not a bit of it. If all kept a "few colonies," overstocking down to a profitless point would continually occur; besides, such is not the nature of things, as specialty carries with it an economy that would soon run the business all into the hands of about one or two bee-keepers in a township; and the law of the survival of the fittest would select these men.

Dowagiac, Mich., Feb. 7, 1883. JAMES HEDDON.  
Concluded next month.

## OUR ROYAL HONEY-TREE.

### A PLAN FOR PROLONGING THE LINDEN SEASON.

**T**HE linden, or basswood, so far excels all known honey-trees, that it has no competitor anywhere near, close enough to be a rival. And, compared with the average run of trees, its period of bloom is quite long; but the bee-keeper feels sad, and the bees feel "like a bear robbed of her whelps" when the blooming is finally over. It would be very nice if we could prolong the linden season by planting road-sides and pleasure-grounds and timber-plantations with some kind of lindens that bloom at a different season from the wild ones. In December's *Exchange* of 1878 I agitated the idea of planting European lindens for this purpose. Reports were sent in from trees already established in this country; and it turned out that, instead of blooming later, they bloom two weeks earlier than ours — although in the botanical flora they are marked "June — August." This was rather a disappointment, but we got two important facts, at any rate; one, that we can prolong the linden season in the other direction from what we were thinking of; and the other, that lindens change their time of bloom when taken to a different climate. This last fact is greatly emphasized by the report given in the *A. B. J.* last summer, of the blooming of American lindens in the botanical gardens of Stockholm, Sweden. How late do you suppose our basswoods bloom when taken over there? September fourteenth!

Well, following the report previously mentioned, H. A. Davis wrote from Western North Carolina that lindens bloom well into August there; and that, if taken north, he believed they would bloom much later. To test the matter I sent for half a dozen little trees by mail — hope the boys won't say, "You stingy churl, why didn't you send for some great big ones by express?" I'll do the best I can to make amends, by pushing the trees ahead. My trees were set March 22, 1880. One died; three fell into that state of hopeless stuntedness to which transplanted forest trees are so liable; and two took hold and grew. One especially delights my eyes by its vigor. Can't quite hope to see it bloom the coming season; but next year I hope it will solve one corner of the problem for us. I fear, however, that the variation will not be very great, from the fact that my trees came from a mountain region, which may not after all be much more forward than Northern Ohio. I have heard since that there are lindens in Texas (called wahoo in some places there), and this is what I am trying to get at in the present article. *Will not some public spirited comrade in Texas send a few to Mr. Root's honey-plantation?* Texas has a very early and very extreme climate; and if lindens from there will endure northern winters, we may hope for as much difference in the time of bloom as there is between New York and Stockholm.

It is surprising to see how much the linden changes the time of its bloom in response to a little change in atmospheric conditions. The same tree will vary nearly a whole month in different years. And where there is a hilly country that has lindens growing both in the valleys and on the hill-tops, there the happy bee-keeper has a chance to "scoop" all the rest of us, when it comes to the game of brag; for the trees on the hills bloom long after the others, and give him a double linden harvest.

The linden will probably prove an easy tree to de-

velop ornamental varieties from. On page 318 of last year's *A. B. J.* one is mentioned that has a crook in the petiole, or leaf-stalk, to throw the silvery side of the leaf into view. It would probably be easy to get a variety, with coral-red petioles and leaf-veins, if it were worth while — at least it runs in my head that I have seen trees that showed considerable red. This adaptability to ornamental purposes is likely to count something in favor of the honey-supply by and by.

Our country is rapidly approaching the point where timber will have to be planted and raised as a crop. The linden has one great advantage for this purpose, that it will be well to keep in mind. Other trees, when they are cut down, "die and make no sign." A basswood stump hasn't the slightest idea of dying. Protect it one year from the greedy browsing of stock, and it will throw up a whole brood of wonderfully thrifty saplings. These can be cut one at a time, and shoots trained up in their places. Don't you see that a basswood-timber plantation, once well under way, would yield a regular yearly harvest for an indefinite period? In forests where basswoods grow naturally, these stools of six or eight trunks of all sizes are often seen; so there is no doubt of the feasibility of getting them started under cultivation. Such young and quickly grown trunks make the grandest kind of sections; and that demand supplied, they make splendid lath.

### WINTERING REPORT.

Packed for winter 117 colonies in my regular way, and 13 more in various experimental ways. Of the former lot I believe all at this date are holding the fort. More bees come out and die on the snow than one likes to see; but I hope it will not amount to any thing serious. Of the 13 experimentals, 9 are not get-at-able, and I do not know their condition; 3 are O. K.; one got drowned by the pit it was in filling with water during the flood of rain and slush with which February opened out. E. E. HASTY.

Richards, Ohio, Feb. 15, 1883.

I am with you, friend Hasty, on the basswood-development project, and my 4000 are coming into bloom now more and more every year. In our forests here we can find, occasionally, blossoms that are as much as a month apart in their time of blooming. In our back volumes we have given proof that they may be raised from cuttings, and it is no great task to get a basswood orchard to blooming.

### ANSWERS TO SOME QUESTIONS.

#### ABOUT WIRE-CLOTH WINDOWS TO THE HONEY-HOUSE.

**O**N page 70, in your comments to A. A. Fradenburg, you ask those who have tested Doolittle's idea on screens for windows to report. I was greatly puzzled to find out some plan of getting the bees out of sections just taken off the hive, and still not letting the bees from the outside get at the sections. I tried all the different plans I could think of, but only to fail, as my bees were something like yours — educated to rob at every opportunity, and almost without opportunity. Well, I read friend D.'s plan in the *A. B. J.*, and so, thinks I, I will try it; but I am sure my bees will find the way in. So I made a large box with a tight-fitting cover, and cut a hole about 2 ft. square in the front, and covered it with wire cloth, letting it run up about 6 in. higher

than the hole, and kept it off about  $\frac{3}{8}$  in. from the front of box; having some sections ready to come off, I placed them in the box without smoking out the bees from the sections. I then took a seat in front of the box, to see how soon the bees would find their way in. In a few moments the bees inside began to come out, and the bees outside tried to get in, but instead of going to the top to get in, they seemed to spend their whole energy trying to get through the wire cloth. I used this all the season (and even after the honey-flow was over, and robbing was the order of the day) with entire satisfaction, for I could leave the honey then as long as I liked, and not a bee would touch it.

#### HONEY-BOARDS TO KEEP THE QUEEN BELOW.

I think friend Heddon uses rather strong language on p. 74 about the queen-excluding honey-boards. I think he makes out that one of the strong points of his honey-board is, that it keeps the queen from going up into the surplus-honey apartment; but they will go up in spite of his honey-board; but I never had any trouble with the perforated zinc.

#### ONE-POUND SECTIONS STILL AHEAD.

On page 77, G. J. Flansburg asks those who have used the 1 and 2 lb. sections to stand up and tell the difference in regard to the amount of honey stored in them. I used both 1 and 2 lb. sections last season, and I am satisfied I got a fifth more honey from those using the 2-lb. box; yet I sold all of the 1-lb. boxes before I sold a fifth of the 2-lb.; and one of our grocerymen told me he would give me 25 cts. per lb. for 1-lb. boxes rather than 15 cts. for the 2-lb.; so I have concluded to run all one-pound boxes next year. The  $\frac{1}{2}$ -lb. section is too small for me.

JOHN MYERS.

Stratford, Ont., Can., Jan. 15, 1883.

### SOME VALUABLE FACTS FROM AN OLD BEE-KEEPER.

#### WHY SWARMS SOMETIMES LEAVE WITHOUT CLUSTERING.

**I** LEARNED, years ago, that if the bees had room so that the whole of them could rush out they would sometimes start for parts unknown without clustering. I think the reason that they almost always alight is, that they are tired of flying, being loaded with honey, and want a rest before starting for their new home; always supposing that they have it picked out before leaving the hive.

#### CLUSTERING OUT; HOW TO PREVENT.

In the spring, when it gets about 80° in the shade, as I go around just at dark I find the strongest want more air, and I take off the oil cloth and put on a burlap grain-sack, double; one thickness lets air through too freely. One bag will last all summer. At first I leave the cover nearly down to the cloth; and as it gets warmer I raise it higher; the warmest days I raise it about 4 inches, and by so doing I hardly ever have any bees hang out. The entrance is left only large enough to give them working room. When a swarm starts out they have to take time — those first out flying around 15 or 20 feet above the hives; by the time the most of them are out, those first out, being heavy with honey, are tired, and, beginning to cluster, draw the others with them. By pursuing this course I have not lost a swarm to my knowledge the last two seasons.

Toward the last of swarming I devised a plan

whereby I think we can almost always catch our swarms. As I said above, the bees coming out slowly fly around 15 or 20 feet above the hives, for some time. We all know how strongly they are attracted to and cluster around any queen, so I thought if I could get a caged queen up where they were flying, I could get the swarm to alight around her.

As soon as a swarm begins to come out we get a frame of open brood and honey, knowing beforehand the hive it is in, hanging on the side a caged queen with 30 or 40 of her bees, that we have taken from a hive to which we want to give a better one. We keep her as long as she lives, and then cage another poor one; we now hoist our frame among the flying bees, and catch them.

#### BEE BALM, FOR MAKING SWARMS ALIGHT.

Some time ago a rather large story-telling acquaintance told me that, when a young man, he hived 23 swarms from the same bush that he had sprinkled with a decoction of bee balm. I did not give it much attention at the time, on account of the source that it came from; but a *reliable* neighbor, who is about 60, told me last spring that, when he was about 15, he helped his father hive bees on a bush or fence-corner, or wherever he would sprinkle a tea made of bee balm and salt. Can't some of our older friends give us some light on the subject?

#### MELTING CANDIED HONEY.

In heating honey to make it liquid, I can not agree with some of our friends who say, "Heat it nearly to the boiling-point," which will spoil the color and flavor of our honey. My tank for heating honey holds 4 five-gallon cans, and I take all day to heat it, keeping the water about 130°, never over 140. A pail of chips, using a few at a time, will do a batch. Our honey is very sensitive, and a little too much heat spoils it. I ought to know, for I have heated up tons of it, as our honey almost all candies in poor or moderate seasons. In good seasons our best honey does not candy, generally. I have some 1876 honey, perfectly clear. In 3 years we have had but two good seasons.

S. S. BUTLER, M. D., 90, 130.

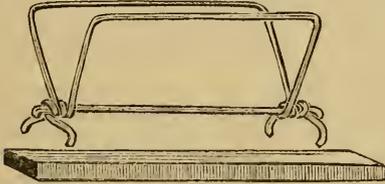

Los Gatos, Cal., Feb. 6, 1883.

I believe, friend B., you are right about large entrances, although it never occurred to me before. I have often stood by swarms going out, and observed the apparent impatience of those out first, when the entrance was so small as to make it take considerable time for all to get out, and I have even seen them come back and try to go in again, where the entrance was *very* small. I now recall to mind a swarm that went right out and off, and it had quite a large entrance. Let us bear this in mind, friends, and see if it is not a new contribution to our stock of bee knowledge. I know that we can, to a great extent at least, prevent clustering by shade and ventilation; and I know, too, that powerful colonies will often remain idle in the very height of the honey-flow, if the hive is too close, and standing in the sun.—The idea of a queen, or frame of brood, or both, to collect the bees in the air, is old, and I believe is usually a success. A queen, with a few bees in a corn-popper, tied on a pole, has been used quite successfully by one of our lady writers.—After one swarm has occupied a certain bush or limb, another is quite apt to; and after several have alighted on it, it is pretty safe to say all the

rest will. I can readily believe that any strong scent, resembling the smell of bees, would attract the straggling bees of a swarm, and thus cause the whole swarm to cluster there.

### TONGS FOR HOLDING FRAMES.

**I** SEND inclosed a small model for tongs for taking frames from the hive. I used them last summer with much satisfaction. They enable a person to take a frame from the hive, and turn it in any direction. They take a firm hold on the frame; and the heavier the frame, the better it holds.

FRIEND VREDENBURGH'S FRAME-TONGS.

They can be made in a few minutes from ordinary telegraph wire. The point that clasps the frame ought to be as short as possible. It is my own invention, and I offer it to you free gratis, in return for the many useful hints I have received from GLEANINGS. J. L. VREDENBURG.

Austin, Texas, Jan. 31, 1883.

Similar devices have been several times suggested, but I believe the above is rather the simplest of them all. It is quite ingenious, and no doubt would prove a help to one who had once got used to it. I do not know that I ever felt as if I would like one of them, unless it was when I had a colony of vicious hybrids, with the unpleasant fashion of crawling off the comb on to one's fingers, whenever you tried to take hold of it at any point. With such bees, I have sometimes thought I should like tongs; but as a rule, I fear I should find them "too much machinery," and let them get lost. However, we tender our thanks to you, friend V., for the kind and generous spirit you show in your concluding remarks.

### THE RESULTS OF ONE WOMAN'S BEE-KEEPING.

39,000 LBS. OF HONEY IN ONE SEASON.

**D**EAR brother in Christ: I feel constrained to address you by the above name, although I have never seen you; but your wise counsel in GLEANINGS, and earnestness in Christ's work, make you seem as a brother in his work, the work of life, which should always be first and uppermost in our lives. I believe if we love our heavenly Father as we ought, and as it is our privilege to do, that all we have and all we are will be consecrated to his work, insomuch that we will feel that we are stewards of the Lord: that our property all belongs to him; not even that he has made us a present of it, but that it still belongs to him, and he desires us to make the most of it, to use it in such a way as to be of the greatest benefit to ourselves and to mankind.

More than ever before have we (Mr. Axtell and my-

self) felt thus the past year, and we have also felt that our faithful God had verified his promise, that if we bring all our tithes into the storehouse he would pour us out such a blessing we should not have room to receive it. We have been trying for years to bring all the tithes into the storehouse, and he has blessed us; but this year more than usual, for we scarcely know where to put so much honey. I don't know how it is about those who did not bring in the tithes, and who received the blessing too, for it seemed there were some such; but that none the less weakens God's promise, and the fulfillment thereof to us.

In the spring we started with 218 colonies of bees; 128 wintered in the cellar, all taken out alive; that is, we lost none in wintering in cellar, but found from 2 to 4 queenless, and nearly all in good to fair condition. The remaining 90 wintered out of doors at Timber Apiary; two or three died; about two were queenless, the rest very strong. This was the condition of them the first time we opened the hives in the spring. The first of April the weather was very warm for that time of the year, and the bees consumed their stores fast, and also increased in numbers rapidly.

In May we had cool weather during most of the month, so that the bees gathered but little from fruit-bloom, and seemed not to increase in numbers; in fact, some colonies seemed to be growing weaker each day, and their stores running close.

### ADVANTAGE OF PLENTY OF STORES IN THE SPRING.

Probably so little honey in the hive was one reason of their dwindling; for those colonies that had an abundance seemed to improve, so that those that were taken out of cellar last, and were rather weak when first set out, had consequently not used up their stores, and were in as good (if not better) condition when clover harvest came than those first set out in the spring, and began brood-rearing so early that they became scarce of honey.

### ADVANTAGE OF SPRING FEEDING.

All our bees that are good colonies were wintered on 7 brood-combs, or more, according to strength of colony. All seemed to have plenty of honey to carry them through, except those wintered outdoors, and those first set out of cellar. We gave to each of these colonies two brood-combs more filled with honey, or as full as brood-combs are generally filled — some full, and others not full. Quinby frames; outside measure,  $11\frac{1}{2} \times 19\frac{1}{2}$ . Guessing at the honey fed, we called it 1500 lbs. We also fed  $1\frac{1}{2}$  barrels of grape sugar (corn sugar, more properly). The colonies kept in the cellar the longest, some of them got one comb and some got some of the grape sugar, so that all were fed some; but I think it would have paid us largely if we had fed half as much more; but we kept hoping they would help themselves; and as it was a big bother, and one of the most unpleasant tasks that a bee-keeper has to do, especially if one has to buy sugar to do so, that one would almost rather lose a few colonies than feed sugar in the spring, as people are so prejudiced against sugared honey. We don't intentionally let any die, but we sometimes let them run very close.

The first week in June found bees doing their best; never saw bees pour in the honey as they did; one week perfectly idle; next week a flood of honey as it were. About the last week in May we had united all our colonies that we could not call strong. We followed the Doolittle plan, as given last spring.

By the way, we have more than one plan we follow which we call the Doolittle plan, for we find his advice generally good and safe. But we concluded that it is generally the safest plan to cage the queen, as we lost quite a number of queens in wintering—several at least. Probably some would have died if let alone; but as we had more bees than we in our poor health knew how to care for, we did not care very much.

When the swarming began we had 20 or 30 two and three frame nuclei, made so by taking away all their brood and bees except what went back, and giving them to other colonies, leaving about 180, or nearly that, of good colonies. I doubt if there were more than 170 good strong colonies by the time we finished all uniting, as we were severe on uniting, as we determined on having strong colonies, and desired no increase all summer, as we had all the bees we wished. We kept no record of numbers united back, as both of us were out of health, and our help was insufficient and inexperienced.

Finished putting on surplus frames the 10th of June; the 13th we had two swarms; from that time until the 10th of September, our last swarm (last honey gathered Sept. 16th), we had swarming every day almost—from one to thirty per day, except about the last of July.

The first swarms we put into hives by themselves, helping them all we dared to, and not have them swarm again. The old stocks we gave more combs of brood, often filling up the hive full with 10 to 12 combs of brood, and a queen-cell just ready to hatch, or one of the best we had. By the time the young queen was ready to lay, the hive was boiling over with bees, and would often swarm when she flew out, especially if any thing had destroyed the first young queen, and they had to raise another. By the above method the bees were almost sure to swarm, but just as sure to gather honey. The swarms were always large, and ready to go into boxes. Every swarm, except strong first swarms, were put back into the parent hive, and also late first swarms were put back.

We had about 400 swarms, but united back until we had, at the close of the swarming season, only about 398 colonies all together. Increased by swarming, about 80. Honey gathered, 39,000 lbs. or more; about 1900 or 2000 extracted, and the rest comb honey, and as nice honey as we ever had.

#### A GOOD WORD FOR THE COMMISSION MEN.

Thirty thousand pounds was shipped to Chicago, and is being sold by five commission men. We are not certain but that it would have been better to have let one man handle it all instead of dividing it to many; for when a person came to buy he would go first to one commission man and then to another, and get his price on a particular brand, and buy where he could get it the cheapest. There is one advantage, however, in leaving it with a number of men, for if one was dishonest, or failed, we should not lose all; but we are each year learning to have more confidence in our commission men; in fact, more confidence in everybody, especially business men and railroad companies.

#### HOW TO MARKET HONEY.

We shipped one lot of our honey to Chicago just as early in the fall as we could get it ready, at so much per pound (about 7000 lbs.), not knowing we could have chartered a car and saved \$10.00 on the shipment. Next time we chartered a car, and then the honey is allowed to remain in it until the commission

men take it out themselves, which they do with their own light spring express wagons. We can send a carload then, if one wishes to, for same price. We prefer to ship by freight instead of express, even small lots. Since very cold weather came, we sent two boxes to Nebraska. The weather was rather moderate while on the cars, and the honey was received all right, not broken badly, and more has been ordered. Our agent takes great pains that it shall be safely sent.

#### REPORTING CHICAGO MARKETS.

I have sometimes wondered that the Chicago market was withheld on comb honey, in GLEANINGS, when the truth is, there are tons and tons of it in the city, selling at a paying price too. Mr. Axtell was there week before last, and none of our honey had sold for less than 15 and 16 cts. in large lots, and 17 and 18 in small lots, crates generally to be returned.

#### GIVING AWAY THE CRATES WITH THE HONEY.

We made our crates so nice that we thought we could not lose them; but in that we think we made a mistake. The crate ought to go with the honey, to be of no more care to the commission men. One of the men who handle our honey, L. A. Burnett, one who handles as much, or more, than any man in Chicago, said he preferred the crates to be of unpainted, fresh new pine; but the others all said paint them, as it gives the retail merchant a better chance for selling. If one ships all his honey to one man he will not be likely to buy so much of another; but if he has a dozen lots from so many different men, his customer has a chance to reject yours, if it is not quite as attractive as others. Honey ought to be graded with the greatest of care, and not one dark or rough comb should be put into a crate with honey represented as nice. If you do, they will remember it, and shun your honey next time. But it is well to have a second grade, *marked* as second, as the commission men say they often have some men who want such, if they can get it cheaper.

#### NO SEPARATORS.

We took great pains in cleaning our section frames, and in putting them in the crates so the honey would not touch, as we used *no separators*. I don't know how we could have kept the bees in the hive with separators this year.

#### PUTTING THE HONEY IN THE CRATES.

And then we put in two thicknesses or more of paper in the bottom of the crate, and let the paper stand up a little around, so if any honey got to leaking it could not run out of the crate, which is a very important thing to do, unless the crate is made so tight as to hold honey, and each comb was perfectly sealed into the section all around, and no broken cells. In handling sections to clean the frames, our girls would cut cells occasionally, which I also found it hard to help; but I found it paid to have clean sections. In handling sections to clean the frames, our girls would cut cells occasionally, which I also found it hard to help; but I found it paid to have clean sections. Some of our sections had been on the hive the year before, and a few two years; but on account of the nice comb in them for starters we used them, and white honey was put in them; but the frames needed thorough scraping before they were fit for market.

For our town market I don't know but that the honey sold just as well if not so carefully cleaned, though we held ours at 18 cts., and the box-hive men got only 15, both in the same store. We sold considerable, but in small lots. If customers wanted 10 lbs. or so, or wanted a whole box, they took the 15-cent honey, as it was just as nice as ours.

Much honey has been sold in our town at 12 and 15 cts., while ours has been held at 18 cts. On our first grade, we gave our grocers 2 cts. per lb. for selling, while it costs less than that to ship to Chicago — freight, commission, and all. Five per cent commission is what we pay in Chicago. Mr. Oatman, of Dundee, Ill., has the name in Chicago of being a first-class honey-producer; also Mr. Haddon.

You will see by figuring, that our bees gave us over 200 lbs. per colony; 216, not counting in the 2-frame nuclei — an almost incredible amount.

#### UNITING BEES TO NUCLEI.

I forgot to say in the right place, that the stocks of the first swarms were given to the 2-frame nuclei. We found that bees would receive other bees better by brushing them down in front of the hive, and letting them crawl in slowly. A few times have we had apparently every bee killed when we attempted to build up a weak swarm by pouring in other bees among them from the top. One such case occurred this summer, and during a good honey harvest too. In 15 minutes I opened the hives, and the strongest smell of poison from the bees told us the work was done. The colonies, I thought, were about equal in strength; and as there were about as many bees thrown out on the front board, I concluded that the work of destruction was done by the bees in the hive.

#### BEE-KEEPING FOR WOMEN.

I think bee work especially fitted for ladies, notwithstanding the testimony of some others. Because I had been an invalid for 20 years, confined to my bed three-fourths of the time, I thought there would be no opportunity for me to live out of doors; but as I had learned to do a great deal of work on my bed, I thought I could be of as much help to my husband as in any other way, and perhaps more; consequently I studied and read every book and article I could get hold of on bees, not only by reading it once, but many times over. My general health began to improve from that time to the present, although I am obliged to keep my bed, or lounge, rather, about half of the time in late winter and spring. Yet my general health is good, and I can always be busy. This fall and winter, so long as I could be up each day I was packing and weighing honey, and having a general oversight of my work; then when I could not be up any longer, I have had placed beside my lounge a pile of honey in sections, the worst frames, and with a sharp pocket-knife, and a sharp-pointed case-knife, I scraped and whittled those frames until they looked like new ones, which added to the value of the honey several cents. Of course, the bulk of our honey was in nice new clean sections. I am troubled with catarrh in the head in winter; but when working over the hot and boiling water, when trying out beeswax, I always find relief — I suppose from inhaling the wax-sweetened water.

MRS. S. J. AXTELL.

Roseville, Warren Co., Ill., Jan. 15, 1883.

(Concluded next month.)

Many thanks, sister. When I first saw your letter, and found there were 50 pages of it, I felt a little troubled; but since I see how full it is of good and useful hints, I have changed my mind. My friends, are there any among you who are discouraged, and thinking of giving up? Just read these little extracts which I take from Mrs. Axtell's first letter for GLEANINGS, printed in our Feb. No., 1874. Here are the extracts:

Many have been the times this summer that both husband and I have wished that we had let bees alone; but there is no backing out now, without quite a loss, which we could ill afford. \* \* \* One of the swarms filled the hive of 2000 cubic inches (box hive), clear to the bottom, so we thought we would do as some of our neighbors did, — pry off the top and take out some of the honey. We inquired of half a dozen or more of our neighbor bee-keepers if it would do any harm: they could not see that it would. So one hot day in August or September we went to work; but such a muss as we got into — bees, honey, and all, squashed down together! It set us thinking if there was not a better way. \* \* \* \*

We had a fine prospect for buckwheat harvest, but an early frost killed it: the bees had scarcely any stores in their hives, and we began to feed near the first of July (just enough to keep them) from  $\frac{1}{4}$  to  $\frac{1}{2}$  teacup daily, in the evening; and as soon as the frost killed the flowers we fed for winter stores; in all, we fed about three barrels (\$90.00 worth) of A sugar made into a syrup.

Now keeping this in mind, just look over the report in this number, of *thirty-nine thousand pounds of honey*. Why! it's away ahead of the gold-mines of California, for it has brought health and happiness, and the gold often brought only trouble. The money from the bees has also — at least a part of it, thank God — helped to carry "peace on earth and good will to men" in many places where it was most needed. Praise God, from whom all blessings flow.

#### FRIEND CHRISTIE'S REPORT.

##### ALSO A SHORT LESSON FOR "BLASTED HOPERS."

**I**NDIRECTLY you ask me for report of honey crop — "your great honey crop" you style it.

I have no great crop to report this year. I had a very cold wet spring and early summer. In June I had to resort to feeding, and kept it up until July. July 2d I removed feeders, and bees became self-sustaining.

We had a light basswood crop; but during August there was an unusual honey-flow for that month. Owing to absence of rain during the greater part of August and September, the goldenrod crop was light.

In May last I had 252 swarms at Smithland and Oto, points on the Little Sioux River, about 6 miles distant from each other. I procured from these about 40,000 lbs. of extracted honey, and put 385 swarms into winter quarters, first feeding them about 600 lbs. of sugar, in order to give them sufficient stores for the winter.

Not being in the habit of reporting my crop to the journals, and not thinking of doing so, I have not been particular to count, weigh, and keep exact track of operations; hence the figures I give are estimates rather than exact figures; but they will fall within the limits of what my little workers have done for me.

I have at different times sold bees on time, taking my pay in honey when bees have gathered it. About the first of August last, a young man to whom I had sold some bees in this way, and who had them located on the Missouri-River bottom, about 30 miles from here (Smithland), became discouraged, and sent a note by mail, saying, "You had better come over and look after your bees, as I leave by to-day's train." He had been gone a week before I received his note and got over there. I found bees in 65 hives, many of them strong, and about ready to swarm; others very weak, having evidently cast swarms

which had hunted themselves homes; four were queenless, and one of these well filled with fertile-worker brood; no honey to extract, but some surplus coming in. I went over them, equalizing as to strength, furnishing hatching queens to the queenless, and giving additional room and surplus combs to those requiring same. Two weeks more the apiary was entirely alone; then I had a hand there to the close of the season. In the interim a few swarms had evidently gone to the woods. I got over 800 lbs. of extracted honey; then I fed about 400 lbs. of sugar, to make full winter stores. No increase.

As my orders to you for labels would indicate, I am putting up more honey than this mentioned, for the market; but the excess comes from earnings of bees that I have heretofore sold, as indicated above; hence your idea of a "great crop." A. CHRISTIE.  
Smithland, Iowa, Jan. 23, 1883.

And I stick to it still, friend C., that it is a great crop, for I don't see that it matters much whether one does all the work with his own hands, or has it done under his own eyes, or sets somebody else to work in the novel manner you describe above. Perhaps I should say to our readers, that we have printed over \$200 worth of labels this season for friend Christie.

### ROCKY-MOUNTAIN BEE BUSINESS.

ALSO SOMETHING ABOUT THE FIGWORT IN COLORADO.

**N**OW that I am having a sick spell you must let me "holler" my whole respects to the Simpson honey-plant. We have acres of it here in the wild state. The acres are all long, narrow, and very crooked; of that shape, because they have to hug the streams pretty closely in their narrow valleys, which are hemmed in on both sides by mountains that are — I was going to say how many feet high, but those fellows that are hinting about honest beekeepers telling "honey fibs" might think it a thousand-foot lie instead of a mountain that height; but I will say that the tops (of the mountains, not lies) are often above the clouds.

There seems to be two kinds of Simpson plant here. One has a red stalk, the other a green stalk, or it looks as though it might be of the red variety after a spell of colle. It is something of a pest with us, as the more you try to plow it out, "the more it sticks the faster," as nearly every piece will grow if it has water; and without moisture it is no go for honey. It commenced to bloom last season about the center of May; but our dear little sting-bugs would not even smile on it for two months. I do not think it holds honey by the "schooner" or "boot-leg" full, as some would like to have us swallow. It also has a yellow spider that goes with it that I don't like. The animal, reptile, or whatever it is, has a body about the size of a pea; the shoulders, legs, head, and vest-pocket, if it has one, are all in a cluster, and stuck on one side of its body — front side I suppose. The spider plants himself or herself to roost right over the lip of the flower, just as a man's nose stands guard over his mouth, and he puts on the look of patience and determination that the boy must have worn when digging the woodchuck for the preacher's dinner; there he waits until a bee, be it honey or bumble, comes along and sticks her head into that flower; then he just reach-

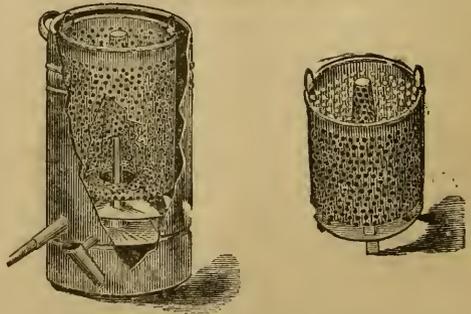

es over and grabs the bee by the back of the coat-collar the same as the schoolma'am does the little boys, and holds it until it either strangles, chokes to death, or forgets to breathe. If you would like a pair of these spiders I will try to send you some when in season. If any one else wants them I will have to charge a little more, because they are all tested, and warranted to be four x Italian spiders, as they are yellow all over.  
H. KNIGHT.

Morrison, Col., Feb. 19, 1883.

### AN IMPROVEMENT IN WAX-EXTRACTORS.

ANOTHER FAVOR FROM THE BUSY BRAIN OF OUR FRIEND D. A. JONES.

**T**HE drawings below will make the matter plain, with a little explanation. The plan is not very much different from our Swiss wax-extractor, only that the copper-bottomed steam-generator is a fixture, and that the steam is admitted right into the center of the mass of comb.

D. A. JONES'S IMPROVED WAX-EXTRACTOR.

The can is almost exactly the size of our 10-gallon flour or honey can, only the bottom is copper. About 6 in. up from the bottom, a swage is run in the can, that catches and holds a second bottom, so it may be securely soldered. This second bottom, has a hole in the center,  $7\frac{1}{2}$  inches in diameter. Around this hole a tin curb is put,  $2\frac{1}{2}$  inches high, with a wire around the top, and this completes the can itself. By reference to the second cut you will see this second bottom, and you will also see that it slopes a little toward the outer sides of the can. This is to carry the wax to the outside, so it may run around and finally be carried out by the long exit pipe. The other funnel-shaped pipe, right by its side, is for pouring in the water that generates the steam.

Well, now, to prevent the wax from dropping down that large hole, into the water, a sloping cover is set over the hole. Three legs keep it from resting right on the curb, that the steam may get out easily, and in the center rises the tube that carries the steam into the center of the wax. Now when we set in the perforated wax-basket, shown in figure 3, we have the whole thing complete. You see this basket has a center of the same perforated zinc, that slips over the tin steam-pipe. The cover to the whole is an ordinary tin sloping cover. Here is what friend Jones writes in regard to the machine:—

I send you electros of wax-extractor. They are, as I think, the nearest to what we want of any thing yet got up, and are patented in Canada. I think that you can confer no greater favor on the people in the U. S. than to make them. Just place the one I send you alongside of four "Weiss" extractors, and see if mine doesn't beat them all. You can make the perforated basket of tin instead of zinc, if you choose. My retail price is \$4.50. You can do them, I guess, at the same, and make a profit.

D. A. JONES.

Beeton, Ont., Canada, Feb. 13, 1888.

Friend J., our people owe you another vote of thanks, if nothing more; and when opportunity offers, we hope to be able to show you we can appreciate your labors, and the free way in which you have given us all the benefit of them. We can furnish the extractor at price named above.

## REPORT FROM CANADA.

### THE MORAL INFLUENCE OF BEE CULTURE.

**I**N making reports of progress, etc., from this wonderful Canada, your many American readers must be canny in their comparisons, remembering that numerically we can not compare with you. Suppose we can not keep ahead of you in apiarian inventions, *big honey-yields*, etc., we congratulate ourselves on being able to keep on a par with you, yes, in sight of you. Bee-men of this part of the province are, generally, men of some intelligence, and possessed of good solid common sense, and appreciate the rapid (and, in many cases, the leading) advancements by the brethren on that side of the national boundary, and we feel that a very narrow space lies between us. Your prosperity, successes, energies, and failures, affect us very much as they do yourselves. We are also well aware of the fact that there is one feature of the bee business which commends it universally to thoughtful minds, and that is, the moral influence it exerts. The system of bee-keeping appears to be impregnated with a deep moral sense, and is influencing not only those directly connected with it, but the public at large. The finger is being pointed at the fabric as a whole, and "behold the fruits of righteousness" is uttered by not a few. We in Canada feel grateful to the great Giver that you, friend GLEANINGS, are, we trust, stamped with the divine image. Thus may it ever be; and amid the ruins of human nature may rays of light from the Sun of righteousness radiate from your pages, is our prayer.

I, being so very busy and crowded with work, have not got the material which I had collected for a re-

port to GLEANINGS ready before this. In fact, I have discovered that procrastination is something more than a "thief of time." He has stolen some of the facts and ideas from my memory. I will give you what I have left, and beg forgiveness for that which was intrusted to my keeping.

The bee business in this part of Ontario has been far from giving a profitable margin the past season. In fact, those who depend upon bees for a living will have to draw on past profits. Considering the backward, wet, cold spring, and poor honey season, we have done quite well, and are, at this time, encouraged to hope for better results the coming season. Bees have gone into winter quarters in good or perhaps average condition. The winter so far has been very steady and cold; but the season up to date has been favorable. Considerable fears were at one time entertained as to successful wintering, on account of poor honey, but the dry weather toward the close of harvest enabled bees to ripen their honey and get it into winter shape, so that, with the exception of short stores, bees are in a fair way to winter, with a small percentage of fatality, and good "springing" will bring through a goodly number of stocks in all well-conducted apiaries. Those put up in the old-fashioned way do not promise so well.

Putting our production, etc., in a statistical shape will run somewhat thus: I do not give my own, but that of a number of apiaries in this section, taken as they come, equal to about 1000 stocks. Surplus, 20 lbs. per original stock. Increase, 50 per cent. Prices averaged 15 cts. per lb., wholesale. Some few apiaries averaged about \$5.00 income per original stock, in honey; and, if wintering successfully, another \$5 00 from increase. This is not a large yield, yet it is better than none. Some have not covered expenses, and, if wintering unfavorably, will be losers.

In respect to modes of wintering, out of the 1000 about 600 are in cellars, 300 in bee-houses, 40 in chaff hives, and 60 out of doors in old boxes. About 300 of the above had no honey after basswood; the remaining 700 had access to buckwheat. Mine gathered an average of 5 lbs. of goldenrod honey to the colony, and about 5 lbs. of buckwheat, all ripened and capped. This, with an average of 17 lbs. of basswood honey, forms their winter stores. All are doing well up to date; no fly yet to those outside. Lowest temperature in this section, 17° below zero. Snow has covered the ground so that we have had continuous sleighing since Nov. 20th.

### WHAT KILLED THEM?

Here is an observation: Bees out the night of the November electric storm seem to have suffered severely. I put 48 colonies into cellar on the 18th, after the storm. They immediately threw out a quart of dead bees. They had a good fly on the 12th. Did the electric storm have any thing to do with such fatality, or did the cold? It fell to 10° below zero. Or did the dampness, the air being saturated, do the bad deed? or was it the combination — cold, dampness, and electricity? Perhaps science has something to say. The bees having a good fly but six days previous to going into cellar would not, under ordinary circumstances, accumulate so many dead at that time of year.

HOW MANY BEES OUGHT TO BE FOUND ON THE CELLAR BOTTOM?

"A B C's" are curious to know if there ought

to be any dead bees in the cellar. I always have a few. I will go and see how many I can get out of the cellar with 48 colonies. \* \* \* I took a goose-wing and dust-pan and crawled in, in the dark, without in any way touching a hive, and got 6 quarts. Do others have any? J. E. FRITH.

Princeton, Ont., Can., Feb. 9, 1883.

Thanks for your kind words, friend F. I do think the care of bees tends to elevate the soul, and to help us to see God; and I do think, too, that our bee-men are, as a rule, if any thing, a little in advance in intelligence of the average run of people.—I do not think the electricity had any thing to do with the bees dying, and perhaps not the dampness; but the sudden fall to below zero found many bees outside the cluster, and this was what killed them.—Six quarts of bees from 48 colonies would be quite moderate, I should think, from Nov. 18th to Feb. 12th. Occasionally a colony of bees is wintered without hardly a bee being found that has died of old age or other causes; but I believe such cases are rather the exception. Perhaps if they went into winter with no very old bees, and their stores were just right, and protection just right, they might come through with no dead bees, comparatively, on the bottom-boards.

### THE CYPRIAN BEE.

WHAT FRIEND MALONE THINKS OF THEM.

**I** BEGAN bee-keeping in the spring of 1880 with 6 stands of black bees in box hives; in April I bought a 3-frame nucleus with Italian queen; in May I transferred to frame hives, and saved the black queen. In August I had raised Italian queens for all young swarms. The year 1880 was a poor honey season, the blacks were so far behind the Italians that I killed all black queens and gave Italians in place.

In 1881 I concluded to try Cyprians. I got a tested queen, a daughter from the queen you got of Hayhurst. She was good, and soon filled the hive full of bees, and they were the "contrariest" bees you ever saw; not so bad to sting, but to boil out all over the hive, and out at the entrance. Whenever I commenced to smoke them, the more smoke they got, the worse they would boil over.

About this time I saw Frank Benton's plan of handling the Cyps, and haven't had any more trouble. I got the Cyprians to test them alongside of my Italians, and I have done it.

Now, I want it understood that I haven't raised queens for sale, and that I gave an impartial test. I had two Italians and two Cyprians sitting side by side in the spring of 1882. They were as nearly equal as could be, and all young queens. They bred up about the same until July 10, when linden opened. I put 6 combs in each upper story, and then watched closely. When coming in laden, the Cyprians would dart in. A large number of them would alight above the entrance, and some would fly clear in the hive, while the Italians would drop two and three feet from the entrance, and rest long enough to unload. Then I said, "You little Cyps, you surely are not carrying very big loads, are you? I will see." So I threw all the honey out of upper stories, and then extracted regularly every two days through

linden bloom; and every time, I got about one-sixth more honey from the Cyprians.

Friend Jones said that Cyprians could fly faster, and carry heavier loads than Italians. I am not in the habit of believing every thing I read; but this I will admit, after testing it. This is not all. I can extract, or can get the bees off three combs of the Cyprians while I can get two from Italians.

When I lift a comb of bees and honey from my Cyprians, and give it a shake, three-fourths of the bees on the comb will fly off and go in the hive; and then give the remainder a brush or two with the turkey-wing, and the comb is ready for the extractor, while the Italians are somewhat like the old darkey preacher's opossum. The worst colony that I had last year to sting was a light Italian that I raised before I had any Cyprians.

Now friend Heddon can have the dark Italians, and Doolittle can have his strain, and I will take a little Cyprian in mine.

If you want pretty bees, I suppose they are the albinos; but just get a Cyprian queen mated with a black drone. Try one, friend Root, and see. They have the white rings. The rings on the black bees are plainer than on the Italians. They are the largest bee I ever saw.

I think my best yield of honey last season was due to the cross between the Cyprians and Italians. I am going to test them further, but will have to get pure queens from both races. Can you furnish imported Cyprians, and at what price? Will some brother who has pure Cyprian queens that he doesn't want, please let me know? I don't care if they are cross. I can soon cook it out of them.

Bees are wintering well. They had two flights in January, and two this month. I haven't lost any yet.

WM. MALONE.

Oakley, Ia., Feb. 23, 1883.

With the conflicting reports and opinions we are having on the matter, I confess myself unable to decide whether a cross with either Cyprians or Holy-Lands is in the end going to give us more honey or not; but I feel pretty sure they are not inferior, notwithstanding friend Foster's report on page 124. The Holy-Lands are surely a boon for getting queen-cells.

### A BUILDING FOR APIARIAN EXHIBITS AT COLUMBUS, OHIO.

OHIO WAKING UP.

**T**HE Ohio State Bee-Keepers' Association, held in Columbus, Ohio, Jan. 9, 1883, did an excellent thing in presenting the following petition:—

To the Honorable Directors of the Ohio State Board of Agriculture:—

Gentlemen,—We, the committee appointed by the Ohio State Bee-Keepers' Association, in convention assembled in Columbus, O., Jan. 9 and 10, 1883, to represent to your honorable body the interest in apiculture and demand for our productions, urgently request that you erect, upon the Ohio State Fair Grounds, a suitable building, with about one-fourth acre inclosed ground attached, in which to exhibit bees and apiarian productions. Plan and approximate specifications herewith attached for Apiarian Hall. We believe the size of this hall, 25 x 50 feet, to be sufficient for our present use, with the space left at one end for extension of hall, if our interests in the future should require it.

SAMUEL D. RIEGEL, } Com.  
DANIEL SPEAR, }

Now let other States take up the matter, and we shall soon all be moving into line.

### SWARMING BY MOONLIGHT.

A "SET-BACK" ON THE IDEA, BY OUR GOOD FRIEND PETERS.

**I**N your Jan. issue I notice an article on "Swarming by Moonlight," which might not have attracted more than a passing thought had it not been for the indorsement of Prof. Cook, the weight of whose authority is acknowledged by every American apiculturist, so far as I know. I have once or twice seen in your journal articles on "Absconding by Moonlight," etc. Now, I had a large swarm to abscond by moonlight (*in a horn*, vulgarly). It happened in this wise: At 4 o'clock P.M. I had a large swarm of Arkansas brown bees to come out. I hived them, and, it being late, I did not put them on their permanent stand, but waited until dark, at which time I proceeded to remove them. I tapped the hive, and *imagined* I heard a buzz, or roaring. Next morning at 9 o'clock I went to inspect my new colony, and saw they were quite still; tapped the hive; none came forth. I took off the cap, and, lo! not a bee was inside. I called to the gardener, and told him that, as the moon was full, the nights being very light, our fine swarm had absconded by moonlight. This amused him very much, and he was inclined to test my credulity by divers questions. At last he exploded into a fit of laughter, and told me I had scarcely left the garden when the bees took wing and went off, he having followed them to the woods. Now, I opine that none of your correspondents were more confident that their bees left by moonlight than I was; and yet the idea was preposterous, as every observer of the habits and instincts of bees must know.

As to Prof. Cook's indorsement of Mr. Moon, I have to say, I knew Mr. Moon; and to his many excellent qualities of head and heart was added a superstitious fondness for the marvelous, and, as a consequence, he was constitutionally disposed to embellish, and no doubt he had seen in the work of Mr. Langstroth a bit of authority for bees gathering honey during a free flow and light nights, which he thought so constantly about that he dreamed he saw bees swarming at night, which was so vivid in his mobile faith that he did not doubt he had seen the simon-pure swarm at night. Prof. Cook touches the subject very delicately, and well he might. I don't think he believes one syllable of it; and I will wager an Arkansas brown colony of bees that you do not. The thing is an absurdity. Bees do not see after night, and nature's laws would be violated.

THE BEST RACE OF HONEY-GATHERERS IN THE WORLD.

Now, friend Root, I believe the hybrid resulting from the Italian and Arkansas brown is the best race of honey-gatherers in the world. My whole stock, although badly set back by the overflow, averaged 280 lbs. of honey, and I left in the supers for winter food, 72 lbs. Now, I will send a two-story Simplicity colony of strong Arkansas brown bees, in good condition, to any man or woman who will convince an *impartial* witness that bees ever do, ever did, or ever will swarm at night. GEO. B. PETERS.

Council Bend, Ark., Jan. 25, 1883.

Many thanks, friend P.; but still I think it will be well for you to go a little gentle on the brethren who think they have seen or heard bees by moonlight. In a recent number some one speaks of having heard a swarm of bees go off when it was too dark to

see them. I have often watched to see if I could see any indication of bees working on very warm bright moonlight nights; but although I saw a bee occasionally take wing, I could not be satisfied that he did more than to blunder about in the dark, only to tumble down somewhere to await for the morning. I saw no bees return to their hive. This was before midnight, mind you. Now if you will recollect what I say in the A B C about the spider plant, you will see that I almost come in for that big two-story colony. I can not now recall whether the east was lighted up by the first gray of dawn or not; but this I do know: That the bees were going out of certain hives, and flying off to the spider-plant field, when it was so dark I could not see them when on my hands and knees before the entrance. I heard them buzz, and felt them with my fingers. After they arose in the air they doubtless found it light enough to guide them in the direction of the spider-plant field; and if they didn't strike the honey at once, they got on the plants and crawled about until daylight came to their assistance. They came into the field in droves, when I could not see a bee, but only heard them. By bending down very close to the flowers, I could see dark spots moving about on them. You will observe that this took place when it was cloudy, and very much darker than bright moonlight. Why, then, did they not fly out on such nights before the approach of dawn? This was a puzzle to me. I was up, and watched the most favorable night that offered, but I never found them stirring until close on to morning. But they may have been, mind you, for all that, for it was, as you know, late in the fall, and favorable moonlight nights were scarce. I am not satisfied yet. It seems to me that I surely can train bees to work on the spider plant by moonlight, by raising plants in the greenhouse, that will be in full bloom during the hot nights in August. If I fail I will get friend Fradenburg, see page 70, to teach his bees to rob from his honey-house, by moonlight. I have tried to get bees to rob by moonlight, to some extent, but failed; but I feel sure I can do it. What has become of the friend who was going to light up the basswood-trees by electric light, and steal a march on old Sol? Come on, boys, and let us get friend Peters' big swarm of bees away from him.

### A NEW HONEY-PLANT.

POINCIANA PULCHERRIMA.

**I**MADE a visit to a neighboring florist, and the first thing I took notice of there was a house full of *Poinciana pulcherrima*, a plant of the tropical regions, which is cultivated largely for its beautiful heads of fiery scarlet flowers, which always come in bloom at the holidays. It is not exactly a flower, but a combination of seed-balls the size of small peas, from 15 to 20 of them. They are of a greenish color, with a yellow crack at the top, which opens when ripe, and out of these cracks oozes a drop of nectar the size of a pea. These seed-balls are surrounded by a bract of bright scarlet leaves, which are used as flowers for floral decoration. These

bracts measure one foot across. Now I just came to think of it, how nice it would be if bees could store this honey without being interrupted by cold weather outside! This house I saw was 100 ft. long and 20 ft. wide, and the plants about 4 ft. high, and literally covered with these scarlet bracts! I tell you, it would do your eyes good to see such a sight, the whole house ablaze with these scarlet bracts. It would be a fine thing to have in bloom when other plants drop off; and as this plant stands drought well, I think it can be got in bloom when other plants dry up. I will try a bed this summer, and report to you how it turns out. Have any that you know of ever tried it? It yields as much as basswood, if not more.

#### THE CALIFORNIA HONEY STORY.

Inclosed you find a clipping from the *Family Story Paper* of some time ago. Do you think this can be true?

Bee Rock, the highest butte in Tulare County, Cal., which was seized by bees years and years ago, and has been used as a hive by them ever since, was blasted out last week and three barrelsful of bees, killed by the explosion, lay dead at and around a comb of honey thirty inches thick, which they had contracted in their den.

Carlstadt, N. J., Jan. 30, 1883.

FR. HOLTKE.

But, friend H., are you sure the Poinciana sends out a drop of honey as big as a pea, every year? or is it only an accidental phenomenon? Who can tell us more about it?—Your bee-cave item is only an old story. The newspaper man probably means a comb 30 inches long, instead of *thick*. The 3 barrels of bees were probably so scattered about, they couldn't measure them, and so they *guessed* at it.

### CYPRIAN AND HOLY-LAND BEES.

#### HOW THEY DID FOR ME.

**I**N the summer of 1881 I bought of H. B. Harrington an untested queen of each kind. As they had been reared in separate apiaries, and proved to be pure, and were very prolific, I thought they would do as fair representatives of their respective races. Last spring their colonies were both in good condition. I could not distinguish the "Cyps" from the Italians in any other way than that they were crosser, and did not store as much honey as the average of my Italians. The Holy-Land queen and bees differed widely from any thing I ever saw, especially in disposition. As they increased rapidly I was obliged to feed in spring, which I did by providing a top story full of comb and honey. About this time I had occasion, for the first time, to shake the bees from a comb. Instead of dropping to the ground, as bees usually do, they "dropped" at me like a charge of buckshot. All their hostile passions seemed to be aroused. I opened fire with the Clark cold-blast, and gave smoke a thorough trial, as I thought, but it seemed to make them worse. After testing their disposition upon several occasions, I decided to run that colony for—honey in the body of the hive.

In June the hive was crowded with bees, and they worked strongly; but, while the Italians were all swarming, and rolling in honey lively, these stored no honey to speak of. Late in July they cast a swarm of about a *quart* of bees. I heard the young queens piping, and as the hive was still full of bees I looked for more swarms, but soon found four or five dead queens at the entrance. About four weeks later they had fertile workers. The combs were about

half full of drone brood, some hatching, less honey than I had fed them, and but few bees.

To dispose of the laying workers, I carried the hive off several rods, and put a new one in its place. I tried various ways to get the bees off the combs. I finally succeeded, by carrying the hive into a field of standing corn, taking one comb at a time, shaking the bees behind a hill, and dodging through the corn to escape them. I gave the returning bees at the old stand some clean combs containing eggs, young larvæ, and queen-cells. In one or two days the cells were destroyed, and the combs were again filled with eggs from the workers. It looked as though the bees had *all* gone to laying. My next move was to supersede the old queen in the new swarm, and the "closing scene" was enacted in the evening, "with charity for all, and malice toward none." The morning light found me with only 14 oz. of Holy-Land bees—dead, and strongly scented with brimstone.

While I willingly take the blame for part of the above failure, I want no more Holy-Land bees of that strain.

OLIVER FOSTER, 63.

Mt. Vernon, Ia., Jan. 26, 1883.

Although we have had stocks of Holy-Lands that behaved much as yours did, friend F., I am inclined to think you condemn them a little hastily. I do not know that I have found the Holy-Lands harder to manage than Italians; still, I have seen them so they would mind but little about smoke, after they were once out and in the air. If smoked before they have got out and made an attack, I have not found them hard to subdue. One of our heaviest Holy-Land stocks, from an imported queen, were so gentle I always selected them to handle, because they were the best behaved of any in the apiary. Their inveterate habit of having laying workers, about as soon as they are made queenless, it seems to me, is an objection. I have also been a little inclined to think they sometimes fail to store honey when Italians do. Yours is a pretty bad report, surely, friend F.; but we want to hear from all, and I am glad you have given it.

### THE ABUTILON AS A HONEY-PLANT.

#### MORE FACTS ABOUT IT.

**P**LEASE let me tell you what I know of them. In conducting your honey-yielding experiments with abutilon, I think you will find one variety to be superior to all the others. This sort is a white flowering one, called *Boule de neige* (ball of snow), extensively used by florists in the cut-flower trade. This white variety is a very prolific bloomer and compact grower, and is quite distinct from the yellow and striped varieties, which are a gaunt and coarse-growing class, flowering but little, as compared with the masses of bloom produced by the *Boule de neige*.

There is also an old-fashioned white abutilon, which must not be confounded with the one I am speaking of. The nectar produced by this variety of abutilon is plentiful, and, I think, exceeds that of the others in quantity; it is also an immense pollen-producing flower. The yellow one mentioned by Mr. Edmundson may be an exception; but I think Mr. E. will find the white one better, after having

given it a trial. The plant in your office has probably become offended, because no one noticed how hard it was trying, and now it has decided to stand on its dignity; or, perhaps, being among so many bee-folks, it has learned all about bee culture, and is aware of the fact that bees gather no honey in winter; hence there is no necessity for secreting any. I trust that it is not in the condition of the geranium I once read of in a comic poem, as comprising part of the baggage belonging to a medical student, which was described as being "stalky, but leafless."

I have held 50 or 60 flowers of the *Boule de neige* in my hand, suspended by their stems; and by giving my arm a swing through the air, the nectar would descend from them like a miniature shower; this was in the winter time, in a greenhouse.

I have seen the bees working on a large plant in the greenhouse during July; this plant was covered with flowers (about 300 of the handsome bells in full bloom). The bees were around the plant in a swarm, all spraying a liquid, I judge, in the act of condensing the nectar.

The *Boule de neige*, when three or four years old, will produce great quantities of flowers, without any intermission, from Jan. 1st until Dec. 31st, if grown under glass, permanently. For outdoor culture, I fear its only merit will be that of a handsome, ornamental, but not useful, plant (looking at it from a honey standpoint). Abutilons are too large a species of plant to be grown with profit for honey. Where would you put them in the winter time? Surely not in chaff hives. F. HARMAN, JR.

Philadelphia, Pa., Jan. 26, 1883.

You see, friends, there are plants that yield honey enormously, were we only in possession of the facts in regard to them, and this sight of a single plant keeping almost a swarm of bees busy, right in the summer time, just when we want it, is a fact worthy of record. Any plant that bears honey in such quantities that it may be shaken out, is worthy of investigation. Who can tell us more about it?

## SOME INTERESTING EXPERIMENTS IN WAX.

FRIEND HATCH'S "WAX-WORKS."

**I**N the days before comb foundation was known it did not matter much whether wax was pure or not, for it was mostly used for candle making; and if there was tallow or a little rosin in it, no great harm was done. But nowadays, when nearly all the wax is given back to the bees in the form of foundation, it is of first importance that the article should be of the purest possible make; for these delicate chemists will not only detect and object to a small per cent of rosin or tallow, but show no scruples of conscience in tearing out and destroying any thing objectionable; not only wasting their precious time, and causing us much anxiety, but absolute loss.

Having the foregoing facts in view, I have, during the past season, conducted a number of experiments to determine the following points, not only in regard to purity of wax, but to ascertain other points desirable to know.

Experiment A was with  $7\frac{1}{2}$  lbs. of cappings; 1st, to determine the per cent of wax in cappings; 2d, to determine if the use of an acid was of any benefit

in rendering wax. Divided the  $7\frac{1}{2}$  lbs. of cappings into 2 equal parts of  $3\frac{1}{4}$  lbs. each. Put each half into a cheese-cloth bag; rendered one in the usual way; i. e., by putting the bag into a kettle of water, heating, and then squeezing out the wax. The other half rendered in the same way, except I added 25 per cent of vinegar to the water. The results were as follows:—

With vinegar, 2 lbs. 12 oz. } = 5 lbs. 7 oz.  
No vinegar, 2 lbs. 11 oz. }

Amount of wax from  $7\frac{1}{2}$  lbs. cappings, 5 lbs. 7 oz., or nearly 73 per cent, which is quite a per cent more than as reported in the *Bee Journal* by Mr. Bingham. I think. The wax rendered with vinegar seemed more yellow, and I imagined some softer; but as it gave only 1-3d increase, it is scarcely profitable; or, to state it differently, if one had comb enough to make 33 lbs. of wax by putting vinegar in the water, he could get 34 lbs., or 1 lb. of wax to offset the vinegar; as it would take about 1 gallon, worth, say, 20 cts., there would be no money in it. And we do not think there is enough difference in the quality to pay for the extra trouble.

Experiment B was to determine whether pollen would mix with wax, combs heavy with pollen being taken, mostly new combs, and rendered by putting in water only—combs inclosed in cheese-cloth bag. Result, a mixture of wax and pollen of a dark orange color, and a decided pollen smell. The wax was soft in texture, but at the same time brittle, or rather "short," if I am allowed the expression, something like a mixture of flour and lard—only, of course, not so much so. Next, to get rid of the pollen was the problem. I succeeded by simply heating the wax in a dish containing no water, until it was almost to the burning-point; this turned the pollen to charcoal, and it settled at the bottom of the dish as a black sediment, like salt in meat-fryings. There may be other ways of purifying wax containing pollen, but I tried none. The heating process is rather risky, on account of the danger of burning the wax. But if it is watched and removed from the fire as soon as the pollen begins to settle, there is not much danger.

Experiment C was to determine whether it would pay to melt up drone comb to make foundation, for every bee-keeper knows what a nuisance too much drone comb is, especially if you run your bees for extracted honey. And I am of the opinion, good authority to the contrary notwithstanding, that bees fill worker combs quickest; I am sure that honey ripens in them first.

To ascertain the facts, I took 410 square inches of drone comb, about one-half new, the rest old, and melted it up, which resulted in 1 lb. 4 oz. of wax. This would make, of foundation running 5 ft. per lb., 900-square inches, or nearly 2 1-5 times as much comb surface as was contained in the combs melted. So my conclusions are, it will pay. I also found, while conducting this experiment, that it would pay to have a press to use in rendering the wax, especially if the combs are old and full of cocoons; for nothing but strong pressure will take all of it out of such combs. C. A. HATCH.

Ithaca, Richland Co., Wis., Jan. 25, 1883.

I have for some time been of the opinion that vinegar does not give us a greater amount of wax, perceptibly, but some seem to think it makes it separate from the debris quicker. I am a little surprised at the results from cappings, given by both yourself

and friend Bingham. Who will tell us what this substance is that is not wax, and then can not some way be devised for making fdn. for brood-combs, containing  $\frac{1}{4}$  or more of some foreign substance, say paper or wood pulp? Who will work out this next great problem of something to save the expensive wax now used for our combs in the body of the hive?

### SHALL WE USE A SMALLER SECTION, OR NOT?

FRIEND G. W. STANLEY'S IDEAS ON THE MATTER.

**S**INCE Messrs. Crocker & Blake, of Boston, Mass., have quoted honey in  $\frac{1}{2}$ -lb. sections at high prices, there has been quite a rage for that style of package. Now, would it not be well for us to look the ground over ahead of us before making expensive changes in our surplus arrangements? As there seems to be some difference of opinion as to whether one can produce as many pounds of honey in  $\frac{1}{2}$ -lb. sections as in larger ones, I will not discuss that point, but will only show my reasons for using the larger sections. I use the 5 x 5 sections, just because I see no need of using a smaller one; and to illustrate this I will say, that last season, when the  $\frac{1}{2}$ -lb. section was selling in Boston at 30 cents per lb., my honey in 5 x 5 sections, holding nearly 2 lbs., glassed, was selling freely in a city near home at 24 and 25 cents, which, as figures will show, gives a balance in favor of the 5 x 5 section with glass, to say nothing of the extra amount of labor that is required to use the small section; and as most of the manipulating comes when our work is crowding, both in shop and yard, and at a time when wages is high, and skilled help is very hard to find, it is to our advantage to get our bees in shape to do the most actual work in the least possible time, in order to do justice to all our bees and still be able to get our needed amount of sleep.

When the 1-pound section was first introduced I thought that it was not needed, or, at least, we were crowding upon ourselves a convenience for the public, if such we may call it, which the public did not at that time require of us; and as those who then took up the pound section mostly discarded the use of glass, that was, of course, a great loss to producers. But some will say, that they can not sell glassed honey. And why is this? Because they are selling it without glass, and telling people that it doesn't pay to buy glass. In the past seven years I have raised upward of 25,000 lbs. of comb honey, and have sold it all at good prices, and have never sold 10 lbs. without glass during the whole period. I have no dissatisfied customers that I know of, and have many calls for shipments of honey after my stock is exhausted. When I commenced I used the Isham glass box; but as they were replaced by the section, I fell in line and first used the 5 x 6, but finally settled down to the 5 x 5, and now I have a standard brand that is as good as gold in any market that has not been spoiled by too small packages.

To sum up, I find the honey market about what bee-keepers make it, and all we have to do is to get the most honey we can from the fewest bees, and with the least possible investment of capital and labor, as that seems to leave us the most money in the fall, and that is what we keep bees for, here in York State.

G. W. STANLEY.

Wyoming, N. Y., Feb. 1, 1883.

### NOTES AND QUERIES OF AN AMATEUR.

HOW HE SAW THE BEES RAISE A QUEEN, ETC.

**P**ERHAPS I had better introduce myself to you, as an introduction to my letter — it being my first letter. An important part of my introduction is, that I am a subscriber to GLEANINGS, and thus far think the money invested in your monthly has paid me largely. I have but one objection to advance; to wit, it does not come often enough. I have read the January number over and over again, until I can almost cite page and position of page where I shall find an article upon a given subject.

For a great many years I have had more or less to do with bees; but not until last summer did I give any special attention to apicultural study. I read every thing pertaining to bee culture I could get hold of, and partially put in practice what I read; or, at least, as far as means and circumstances would permit. As I had but one hour at noon, I must needs do what I did in the morning and evening. I began in the spring with 4 colonies of hybrids that I had wintered on the summer stands. These four I divided, according to my notions of that plan, in the evening, thus increasing to 8. I then thought I would try my hand at raising a queen for an emergency. I went to one of my strong colonies and obtained a splendid capped queen-cell, and inserted it in a sheet of capped brood, with bees enough to cover it; took a sheet of honey and pollen, and formed a two-frame nucleus in a hive that had an observation-glass so that I could watch proceedings. I did watch that cell closely, I assure you; and in due time, to my great delight, saw the queen emerge from her prison. It just seemed to me that the bees were as much elated over the advent of her royal highness as I was. How proudly she moved, circling around the now empty cell, each round increasing the circumference of the circuit, until suddenly she observed a queen-cell in an upper corner of the frame, but just capped, and, quicker than I can tell it, she was there, and as quickly destroyed the royal occupant. She was such a large, beautiful queen that I resolved to build up to a strong colony with frames of capped brood from other of my strong colonies, which I did. In due time she began to lay, and now that colony is one of the best I have. This made 9. I then obtained 2 second swarms from a neighbor for assistance rendered, and bought a first swarm for \$1.00. That brought me to 12. At this time I traded a thoroughbred Berkshire pig for seven more. This gave me 19. I bought a dollar queen, which, I think, has more Cyprian blood in her than I care about possessing. They fight like tigers. The little scamps just double themselves up to see, seemingly, how deep they can get their darts into one's flesh. They got up my sleeves, down my back, into my hair, up my pants, and such "pointed" arguments of the venom their little bodies contained, as I got then!

So much for the progeny of that Italian (?) queen. In September I purchased two tested queens. One has proved all right. The other proved to be a drone-producer; and ere I was aware of it, she and the entire colony gave up the ghost. She will be made good the coming season by the gentleman of whom I purchased her. I also lost one of the 7 I purchased, before it was delivered, which will also

be made good this summer. During the month of September (for that month gave us in this locality about all the honey we got) I took in boxes, and extracted, as nearly as I can guess, about 300 lbs. I think if I had weighed it, it would prove to have been more rather than less. I now have 17 colonies in the best condition, packed in chaff on the summer stand. Yesterday being a beautiful day, I let them have a fly, which seemed to please them very much.

FRANK M. SNYDER.

Urbana, Ill., Jan. 30, 1883.

### BEEES IN KANSAS.

FROM 9 TO 28, AND 325 LBS. OF HONEY.

I AM still an A B C scholar, and am still pretty near the foot of the class. I began last spring with 9 medium colonies. The spring proved so very cold and wet that the bees got no benefit from the fruit-bloom, so I had to feed till the middle of June; they then began to fill up very fast with bees; in July they took the swarming fever, and no amount of room, nor any of the rules laid down, would stop it; so I just *let them swarm*. They increased from 9 to 28, and all filled up well with honey.

I did not get the extractor I ordered of you soon enough to get much honey; that is, I did not *order* it soon enough. It came promptly on time, and is a good one too. All the trouble was

#### THICK HONEY.

My honey was so very thick that the strainers would clog so as to hinder operations. Having to stop and change strainers so often, I finally made one four inches in diameter, of mosquito bar doubled, and then got along much better. I obtained 325 lbs. of honey, very thick; weighs 12 lbs. to the gallon, which I sold at 20 cts. per lb.

I found an old-style bee-keeper who told me he was going to kill some bees to get the honey. I told him if he would let me, I would go and take out the bees and try to save them. He consented. So, late in November, I went and took out 8 swarms, doubled to 6, and gave them 5 frames of sealed honey; packed with chaff cushions on each side, and chaff cushion on top, and now they are all on their summer stands, nearly buried up in snow. I feel pretty sure that another fall I will put my bees in a clamp, *a la* Boomhower. There every bright sunny day the bees will not come out and perish on the snow, as some are doing to-day.

Then the dollar-queen business, that ought to have been included in friend Wiltse's "Fallacies," in bee-keeping. Some of my very best queens I bred right among black drones; two queen-cells I grafted (from the same comb) into 2 nucleus hives; one was a bright yellow queen, and the other was a very dark leather-colored one. Each produced three-banded bees. These experiments prove to me that home-bred dollar queens are often as good as any.

I have bought quite a number of dollar queens of friend Hayhurst, and only *one* proved to be impurely mated, and that one he promptly replaced. If all the dollar-queen breeders were as square as friend H., there would be no cause for complaint. I should not like to pay 3 or 5 dollars for a queen that its owner had kept one-third its lifetime, used it one year

to test it, and found just what I could have found out, and had the whole season's use of it. I expect to use dollar queens till I see differently than now.

#### HONEY-DEW.

Last summer we had a great amount of honey-dew—the first I ever saw. It was on the cotton-wood-trees in town; every case proved to be the work of the aphid. The honey-dew dropped on the sidewalks till, in some places, they would show the large drops like the effects of drops of grease on a pine floor; yet the bees would not work on the leaves of this tree more than till 9 o'clock, when the sun would have dried it up. I am somewhat afraid that it may cause dysentery among the bees this winter.

J. W. MARGRAVE.

Hiawatha, Brown Co., Kan., Jan. 27, 1883.

### MOVING BEES FOR BETTER PASTURE.

THE WAY FRIEND SWARTWOUT DOES IT?

EACH year as I watched the honey come and go, I have been more impressed with the idea, that to gain the most profit I must move my bees. The next questions which came into my mind were, when, where, and how to move. As clover and basswood form the main crop here, and as it would cost about 30 cents per colony to move, I thought it would pay better to feed up to clover-bloom. It does not cost much to feed when your colonies are weak, and a little honey is coming every few days; but at the close of the basswood, with heavy colonies and lots of hatching bees, it is quite a different thing, so I decided that was the time to move.

Where? Where there are marshes with plenty of fall flowers, or buckwheat bloom. Be careful not to overstock, as it is much easier than you think in the fall.

How? Extract all the honey, with the exception of 6 or 8 lbs.; place two thicknesses of burlap over the frames, and close the entrance with wire screen. If you are working for comb honey, remove all sections that are filled, or nearly so; extract what is left, to be used to fill those removed which were not finished, as it is white honey; fill up with sections, put on the burlap, and close the entrance with wire screen. Have every thing all ready the day before you move, so all you have to do is to close the entrances and take off the tops. Have a good spring wagon — platform springs are the best; place it as near the bees as possible. Now get up early, close the entrances; take off the tops; place the hives on the wagon, with the frames running lengthwise, as they will ride much better in that position; hitch on your team, and, where the road is smooth, drive rapidly so as to get to your destination before the sun is very hot. Unload your bees; place where you want them to stand; open the entrances, and look to see that no frames have been moved.

The man who moves bees once with these conditions will move again.

J. J. SWARTWOUT.

Union City, Mich., Jan. 4, 1883.

Very good, friend S.; but I wanted you to tell us just how much you gained by it, and, in short, a full report of your proceedings and success in the matter. It is true you give us a hint that you did well, but we want to know just *how* well.

### THE GOLDEN BEE-HIVE.

WITH A GOOD MORAL ON PATENT HIVES IN GENERAL.

**P**ERMIT me to say, through GLEANINGS, that I use the "Golden" bee-hive, and would not exchange it for any other hive in use that I have ever heard of. The inside is almost identical with the hive used by A. J. Cook, described in his Manual, pages 132 and 133. The frames are  $10\frac{1}{4}$  inches deep by  $11\frac{1}{2}$  inches in width, outside measurement. Frames go crosswise, with division-board behind. I commenced using it four years ago, and would say to Mr. Lewis A. Easterly, of Sandy Ridge, Ala., that I have in my experience found the hive just the reverse of his. I paid for the use of the hive, one hive and a swarm transferred into it, and an extractor—\$15.00. It was the best invested \$15.00 I ever made. I have made over 200 of them, and expect to make 75 more this spring. They are the leading hive here. Several bee-men who have the Langstroth and Simplicity hives are transferring their bees into the Golden.

I had an old bee-man work for me one week last summer, who has 40 to 50 stocks in Simplicity hives; he said he was certain I was getting one-third more honey in the Golden than could be obtained in the Simplicity. \* \* \* \* \*

The first winter, 1879-'80, I used it, I had 32 stocks in them; lost none. The winter of 1880-'81 I wintered 86 with ten loss; 1881-'82 I wintered 90 stocks with the loss of one. I put in my cellar this winter 119; so far they are all O. K.

Now a few words as to honey results: The summer of 1880 I had 32-stocks in the Golden; 15 in box hives, spring count. I got 4500 lbs. of honey. The summer of 1881 I had 50 stocks, spring count; I sold down to that number in the spring; sold to one man \$100.00 worth. I got 3500 lbs. honey, about one-third in section boxes. The summer of 1882 I sold down to 80 stocks, spring count. I got 8000 lbs., 2000 lbs. of it in section boxes.

OVER A TON OF HONEY IN EIGHT DAYS FROM EIGHTY COLONIES.

On the 19th day of July—Saturday—last summer, my bees began to work on basswood. I had kept well extracted up on white clover, for I expected a basswood flow. On the Tuesday following, three of us began to extract; swarming was also going on, and by Saturday night we had taken 2200 lbs., *eight days' gathering*; during the same time my comb-builders put up 800 lbs. comb honey. Now, at the price I got, 12c for extracted and 20c for comb on track here, my bees gathered \$424 worth of honey in eight days. How is that for Golden bee-hive?

I have arranged the hive for comb section-box honey; each top holds 36 sections, upon which arrangement there is no patent; indeed, there is no patent on the hive as I use it now, while I have not changed the body of the hive an iota. I know the hive is a success. I commenced at the beginning four years ago; result, about 18,000 lbs. of honey.

Trusting you will give this a place in your valuable paper,—yes, valuable, for I owe much of my success to its teachings,—I remain truly yours,

B. F. LITTLE.

Brush Creek, Iowa, Feb. 9, 1883.

I am very much obliged indeed for your good report, friend L.; but if you will excuse me, it seems to me you have most effectually spoiled it as a testimonial for the Golden hive, or the men who sold rights, by

that little speech toward the last, where you say, "Indeed, there is no patent on the hive as I use it now." Mitchell, and all the rest of them down, have had a patent on some unimportant trifle hitched to the hive; but every progressive bee-man, almost invariably, of his own choice, soon drops these things, just as you have done, and still the patent man goes on taking money for rights. Is this "right," I ask you? I never intended to intimate that one could not get honey with the Golden hive, but only that it is a swindle to ask people to pay for a right to make any thing about it that is of any practical use. Very likely you and many others would succeed better with a frame of different dimensions from the Simplicity; but why buy a right for making them so? If you will look over our back volumes you will see, friend L., that the Golden hive has been used a good deal for defrauding in different ways.

### BLUE THISTLE.

SOMETHING ON THE OTHER SIDE OF THE QUESTION.

**G**LEANINGS, page 87, gives an account of Division Grange, London, Ont., regarding blue thistle, and resolution therefrom, apprehending great danger to the farming community in consequence of the introduction of the same. Now, while I earnestly hope that no bee-keeper will introduce, or be the means of introducing any weed, plant, or shrub, that will in any way interfere with the agricultural interests of our fair land, I hold that we are fully justified, and should be encouraged and assisted by the farmers and the public, in changing the present condition of our waste places, fence-corners, and road-sides, of which many are grown up with worthless shrubs, brambles, burrs, ragweed, dog-fennel, etc. These, with justification to all concerned, should be destroyed, and the ground reseeded with clover, figwort, or, in fact, any good honey-plant or shrub would be an improvement on the former, to say nothing about the increase of nectar, and the enhanced value of real estate, if such change were made.

Well, I started out in search of the evils of the blue thistle, and here is what I have found. Judging from the tone of many letters that have been written on the blue thistle, I was not very favorably impressed; I therefore addressed a letter of inquiry to a gentleman in West Virginia. Note his reply:—

Your letter of inquiry regarding blue thistle is received. I would say that I have traveled over a large portion of Shenandoah Valley, and find that the best farmers court its presence, regarding a crop plowed under as good as clover to enrich the soil. Try a field of it, and you will be convinced of its untold value as a honey-plant. J. A. SHADE, M. D.  
Pleasant Dale, W. Va.

I at once introduced it into my experimental garden, and here is my report, after two years of trial:

Biennial; root fleshy, tender, and very large; it makes a perfect root first year, but does not grow any the second year. Blooms June 1st, and continues without any diminution fully four months, unless interfered with by frost or drought; seed as large as red clover, and can not spread by being carried by wind. At close of flowering season the root will be found in an advanced stage of decomposition; bears cultivation, and is highly benefited

thereby. As to its honey-producing power, I now place it at the head of all plants that I have tested. Blue thistle first, figwort second, and white clover and basswood next. Its chief value is the extraordinary length of time of its bloom. Contrary to my expectations, when basswood bloomed, the bees did not desert the blue-thistle patch, but kept right on, and seemed as much pleased as before and after.

May I not suggest, that many of the discouraging letters that have been written have been owing to the fact that this plant is called a thistle, they concluding that all thistles are bad and noxious weeds? My experience so far is, that it is just as harmless as figwort, motherwort, or mullein. If plowed under or pulled up, that ends it; and as it seeds only the second year, it can be easily overcome. The word thistle carries with it a settled conviction of thorns and jiggers; but not so with this plant; yet it is covered with fine short bristles, but they will not injure the hands while in a green state.

Bloomdale, O., Feb. 10, 1883.

R. B. ROBBINS.

### WATER FOR BEES.

A PRETTY DEVICE FOR A WATER-FOUNTAIN, SENT US BY A BEE-FRIEND OVER THE "WATER."

**S**INCE beginning bee-keeping, many years ago, I have always regularly supplied water to my bees by various modes, and send along with this a photo for your acceptance.

A WATER-FOUNTAIN FOR THE BEES, FROM FAR-AWAY SCOTLAND.

The watering-stage on top, with gutters from a common center to a circular one, outer circumference, I had originally cut in marble; but being too expensive for general use, I applied to a large pottery establishment, and from it had a mold made and

copies reproduced in polished white earthenware. They require great pains in firing, to preserve a true level, but are much superior, and do not split off like wooden ones. The bottomless water-bottle, or barrel, set thereon, is fern engraved, and has a nice cool refreshing effect to the eye in hot weather.

J. M. MCPHEDRON.

Craigbet, Renfrewshire, Scotland, Dec. 7, 1882.

Perhaps I should explain to our readers, that we have cut down the height of the pedestal some in our engraving, but it shows pretty well the handsome design our friend McPhedron has furnished us. I know wood is hardly the thing for the base of our watering-jar, and some of the friends may remember I first used a stone washboard, with the sides of the grooves stopped with wax; but the grooves were too large, and the bees pushed under, and rose up into the jar, and were drowned. The grooves need to be so small that a bee can not even wedge his head in one of them; for if he does, many will get fast and die; and who wants to see dead bees sticking around a nice feeder? After this I had a block of sandstone hewed out, and set the water-jar in a cavity in the top of this; but to my surprise I found the sandstone would take up a whole pail of water in no time, and during a dry atmosphere it would absorb and give off water about as fast as I could bring it. I should be very glad of some stone china grooved feeding-boards. Who can furnish them in our own country?

### PUTTING THE SECTIONS UNDER THE BROOD-NEST.

HOW FRIEND SHANGLE GOT 204 POUNDS OF HONEY FROM ONE HIVE.

**Y**OU wanted to know how I got that 204 lbs. of honey from that swarm of bees. I waited till my bees got their hives full of bees and brood and honey; then I raised them, put another story under, full of sections, when they commenced working in the sections. I extracted the brood-frames, and got 24 lbs. The queen filled them with eggs. She did not bother the sections. I kept watch of the sections, and when they got them full I took them out and put more in their place.

DAVID SHANGLE.

Judd's Corners, Mich., Jan. 19, 1883.

This idea of putting the sections under the bees is hardly a new one; yet I doubt if many have made it work as well as friend S. did. One of our English friends some time ago said we would get lighter honey by this means; but my experience has been rather to the contrary. Where we have strains of Italians that are so determined not to go up into an upper story to store their surplus, this plan might work admirably, only it seems to me it will be a little laborious to raise heavy stocks of bees every time we want to put on or take off—beg pardon; every time we want to put *under*, or take *out* filled sections, or case of sections. Who can tell us more about it? and is the honey whiter than that stored above, or to the contrary?

## A BOOK ON INTRODUCING QUEENS.

ALSO SOMETHING ABOUT UNITING BEES.

**W**E make the following extracts from a little book of 28 pages, coming from Sam'l Simmins, Rottingdean, Brighton, Sussex, England:—

For many years there has been no better way of introducing an alien queen to a stock of bees than that of confining her in a cage for a number of hours, until the bees get acquainted with her; and should the operation be conducted at a time when there are few young bees and no brood, it is often necessary to enrage the queen several times before the bees will accept her, and occasionally even then she is destroyed after all the loss of time and labor.

Some of the foremost bee-keepers of the day are now and then perplexed with a difficult case, and resort to the unnecessary practice of stupefying the bees to get them to take a strange queen. One scientific bee-keeper reports how, after making a colony senseless seven or eight times, they destroyed his queen after all.

During summer, when bees are breeding, and bringing in honey, it is generally an easy matter to get them to take a new sovereign; but bearing in mind the many inconveniences, and loss of time occasioned by using the cage, and, above all, the colony being deprived of a laying queen for a day or two, perhaps at the most important time, I determined on prosecuting a series of experiments, in the hope that I might ultimately dispense with the old method entirely. I have, fortunately, succeeded beyond my most sanguine expectations, and under my system, described in the following pages, a queen can be introduced direct, and absolutely without risk, to any colony, whatever may be its condition, providing there is no other queen in the hive.

I have successfully introduced queens forthwith to colonies with fertile workers, having at the same time queen-cells sealed over. Also to old bees that had been queenless and broodless for several months, and to ordinary colonies with queen-cells in all stages of development, up to the moment of hatching. I have also exchanged a queen of one hive with that of another at one and the same operation, and the bees have taken no notice whatever of the change.

### THE SIMMINS METHOD OF DIRECT INTRODUCTION.

Having often united bees without disagreement, by alternating the combs of the respective hives, I came to the conclusion that a queen on a comb, parading unconcernedly among her own bees, would be taken no more notice of than the others; and this I have, by unvarying success, proved to be the case, and the amount of vexation, time, and labor, saved to myself, has already been considerable.

### INTRODUCING QUEENS FROM NUCLEI STANDING IN THE SAME APIARY, OR RECEIVED FROM A DISTANCE—ON STANDARD FRAMES.

Where one has spare queens in nuclei, and all the frames are of one size, a queen can be introduced to the desired colony simply by inserting the frame of comb on which she is, surrounded by her own bees.

Carry the comb from one hive to another in an ordinary comb-box; remove the queen that is to be superseded (if one), and as soon as the stranger, with her attendants on their comb, is placed in the hive, the union is certain, and there is no need to examine them again until their turn comes in the ordinary course of manipulations.

It will be observed, that instead of the bees being first permitted to find out their loss, the exchange is completed before they are aware of the fact; and the colony is not without a laying queen even for five minutes—a great consideration, especially when building up at the commencement of the season.

A queen received from a distance in a nucleus hive with frames of the right size, can be united, together with her bees, in the same way; but it is advisable that the nucleus be first placed near the full colony, and the bees allowed to fly. By evening they will have recovered from the excitement of the journey, when the union may take place.

### QUEENS RECEIVED IN SMALL BOXES; OR THOSE ON ODD FRAMES.

In the above case the queen should be shaken with her attendants into a comb-box on to a comb containing unsealed honey;\* close up securely, and leave them for a few minutes, while the colony to be operated upon is being deprived of its queen, when the combs should be parted at about the center of the hive or cluster of bees. The sides of the combs nearest this vacant space and the adhering bees may then be sprayed with sweetened water (not scented), when the occupants of the comb-box on their comb may be immediately inserted, as in the first instance, and all will be well.

A queen can also be inserted *alone*, on a comb of unsealed honey (or syrup). In this case she should be without food for a short time previous to being placed on the comb, when she will at once proceed to feed at the open cells, and, while doing so, can be inserted (together with the comb) as before.†

Where on odd frames, a queen can be brushed off the comb with a good number of bees into the comb-box, with a feather, and then united in the same way.

### CONDITIONS NECESSARY TO INSURE A SUCCESSFUL UNION.

Brushing the queen from a comb with a feather is much to be preferred to handling her; and if the operation is quickly performed with a light touch, she is not rendered restless and nervous, as is the case when liberated from the hand.

When introducing a queen on the comb from her own hive, no syrup whatever is necessary, and none should be used; but where she is first placed on to another comb, the conditions are different. She has been disturbed by being turned from one box or hive into another, and in some cases a long journey has preceded the change; therefore it is best to use a little, as advised, just to give the bees something to do for a time, in case any such queen should show a momentary nervousness, which, however, will soon pass off, and no hostility is shown toward her.

*On no account, in any instance, should a queen be daubed with syrup, or disturbed more than is absolutely necessary, as so much depends upon her appearing among her new subjects in an unconcerned manner. This is just the secret of the success of this system. The queen is placed where she feels at home—on a comb, surrounded by a number of her own bees. On the other hand, bees are delighted to receive a comb of honey, especially if it also con-*

\* If a comb containing unsealed honey is not at hand, a little syrup can be substituted by pouring it into the cells on either side of a comb before it is given to the strangers, previous to their introduction.

† Wherever a queen may be placed, whether being alone or with a few attendants, she should be kept warm; the slightest chill being injurious to her constitution.

tains brood, as is mostly the case where the queen is transferred on her original comb.

It is a mistake to suppose that bees can not be united unless they have the same scent. Wherever there is a case of fighting in uniting bees, it has been brought about by the new comers not making themselves at home in their fresh quarters, and this attitude of uncertainty and strangeness is sure to bring down upon them the vengeance of the original inmates of the hive. This state of things is brought about through the operator being ignorant of the peculiarities of bees, and therefore not proceeding with his work upon the right principles of management. In his hands the result would have been the same had both lots of bees been sprayed with scented syrup.

By following the rules laid down in these pages, the merest novice may always succeed in uniting alien bees or queens to any desired colony, and no scent need be used in any case.

Where the bee-keeper has no spare combs, one should be taken from the colony that is to receive the queen, but *every* bee must be removed before it is given to the queen and her attendants in the comb-box.

The author very rarely uses syrup in any case, and never where the queen is inserted on her original comb; but where it is advised, the novice can not do better than follow the instructions given, when he can be assured of a satisfactory result.

#### IMPORTED QUEENS, CAUSE OF DISAPPOINTMENTS AND FAILURES WITH; HOW THEY SHOULD BE INTRODUCED.

I would never advise that a good laying queen be disposed to make room for one just received from a long distance. The latter will not produce an egg for the first day or two, and very few for a time, when she does begin, and will often be two or three weeks before she recovers her natural fecundity. Some never lay at all, while others, for a time, produce as many drones as workers, and soon die, or are superseded by the bees, if the bee-keeper does not trouble to do it himself. Long confinement and exposure are the causes of this tardy development and failure of production; although, of course, there is the probability that by an oversight a queen may not have been mated before being sent out. In that case she would either not lay at all, or produce drones only.

Bearing these facts in mind, the careful bee-keeper will give imported queens to nuclei, and either gradually work them up to a full colony, by occasionally giving frames of brood; or, after a few weeks, unite them to the desired stocks. Thus the condemned (and often prolific) queens are not displaced until the new comers have had a chance of proving their fertility.

#### UNITING BEES; THE FALLACY OF USING SCENTED SYRUP.

As I have never used scented syrup when uniting bees, I will only say that my success has proved that the various articles advised for the purpose are simply useless. In every case where a union has been effected, when adding peppermint, etc., to the syrup, without hesitation I assert that the same result would have been attained without the scent, and, in the hands of an expert, without syrup in any form. If the bees are rendered predisposed to fight, through the operator not understanding their peculiarities, or the exact condition of those in hand,

it matters not, even should he smother them in syrup, scented or otherwise, fighting will result.

The following directions will show how bees can be induced to amalgamate under all conditions, and without being sprinkled with syrup of any kind.

#### UNITING BEES WHEN ON THE SAME-SIZED FRAMES.

If the hives to be united are not already adjoining, bring them a few feet daily nearer to each other, keeping the entrances toward the original directions. In the meantime take away all combs that the bees can not cover; and when the hives are brought together, remove the queen that is not wanted, and then insert the combs with the adhering bees of one hive alternately with those of the other. What few are left about the sides of the denuded hive can be brushed out, or shaken on top of the frames, when the hive may be closed up, and the union is effectual; the remaining queen also being undisturbed and allowed to reign supreme.

#### WHERE BOTH COLONIES ARE IN ODD-SIZED FRAMES.

Bring them together as before, remove one queen, and then shake off from their combs the whole of the bees of both lots on to a wide board slanting up to the entrance of the hive they are to remain in. Give plenty of room at the entrance, and all will unite in one happy family. Should there be any brood left in the rejected frames it should be given to other hives containing the same size, or it may be cut out and fitted to those of the size given to the united bees, and placed about the center where it will soon be fixed up.

#### UNITING DRIVEN BEES, OR A SWARM WITHOUT COMBS, TO AN ESTABLISHED STOCK.

It will be of no use to toss the strangers on top of the frames, thinking they will draw down among the occupants of the hive. In that case instant fighting would be the result, and this will continue until the intruders are exterminated.

The only effectual plan is to shake or brush off from their combs the whole of the bees on to a board as before, and then after removing all but the selected queen, mix the new comers up indiscriminately with the rushing, "fanning" crowd, and all will draw in peaceably together.

The same method applies in the same case to straw hives, except that the bees will first have to be driven out of the fixed combs, and then returned together with the strangers.

#### WHERE BOTH LOTS TO BE UNITED HAVE NO COMBS.

Being either swarms, or driven bees, nothing is easier than to mix up both lots on a sheet, or board slanting to the front of the hive, when they will all draw under cover together.

In every instance there is one thing that must not be neglected, and that is, only one queen must be retained, whether selected or otherwise.

#### FERTILE WORKERS; HOW TO GET RID OF THEM.

The means generally adopted to exterminate them, though not always effectual, besides entailing much labor, is to remove the hive to some distance from the old site, when, by shaking from the combs the whole of the bees, the main body fly back to the original location, while the laying workers, supposed not to have flown, are thought to be unable to return.

My method of direct introduction always answers most effectually in disposing of the nuisance. No matter how bad the case may be, even if they have queen-cells (so-called, but containing only drone larvæ), the fertile workers subside immediately on

the insertion of a queen on her own comb of brood with adhering bees.

While we feel under obligations to friend Simmins for his experiments in this matter, and also for so earnestly directing more attention to this subject, I feel a little sorry to see him so positive that his plan will work *invariably*. If I make no mistake, it is exactly the same thing that most of our readers have done every year, in uniting nuclei. Lift the bees, combs and all, out of one hive, and set them into the other; and if either one is queenless, there will ordinarily be no trouble. It was once a favorite plan of mine, to take a queen, comb and all, and set it right in the center of any other colony; but after I had a fine queen stung, with every bee that the comb contained, along with her, I concluded there were exceptions, and stopped. Since then we have used the same plan for uniting bees so much, with so few failures comparatively, it has occurred to me that we had not given the matter sufficient attention. A year or two ago somebody said a queen could be let loose at once, in a colony made up of combs and bees taken from several stocks, and all mixed up. We tried it, but found them the most difficult to get to take a queen, of any in the yard. Pure Italians will unite and receive queens, almost any way; but cross hybrids are quite a different thing, for introducing or uniting either. While I feel sure that there will be failures with the above plan, I would advise giving it a more thorough test this coming season, and very likely we shall find it a help. I am strongly in favor of some plan by which the queen may go right to work the day she is put in the hive; and many of you know how much I have said about letting queens right into the hive without any introduction at all.

## Ladies' Department.

IS BEE-KEEPING TOO HARD FOR WOMEN?

A CALIFORNIA WOMAN'S EXPERIENCE.

**I** HAVE this morning finished reading December GLEANINGS; and though money is not plentiful with me, I would rather lose \$10.00 than do without the knowledge gained from that single number, from the articles by Doolittle, about rearing queens, Heddon on swarming-basket, and other articles too numerous to mention. But not for this am I writing to you now, but to answer a question by a lady. Is bee-keeping injurious to woman, and the labor too great? The best answer is practical experience.

I was in delicate health, every summer sick with nervous prostration (caused by teaching during winters), and malarial fever; and to overcome both difficulties we exchanged our home in the rich San Bernardino valley for one in the mountains. I started bee-keeping with two swarms of black bees; and as they were moved 50 miles in June, they reached home in a sad plight—broken combs, drowned bees; but by knowledge gained from ABC and GLEANINGS, I built them into strong colonies, and had honey enough for home use. Sick six

weeks in July and August of 1879. Next year I made one new swarm, and honey enough to buy our flour for a year. Sick again in August and September. Doctor thought it impossible for me to recover, and for several months my arms were paralyzed; but by spring I could drag myself about, but, oh so feebly! and I would work amongst the bees, which I increased to 5 swarms. Day by day my strength increased, and nothing seemed to bring it back so much as the outdoor exercise, which the care of bees necessitated. That winter I taught school. In the spring I went back to my bees; increased them to 14 strong swarms, and 3 light, which lived through the most severe winter ever known in Southern California. In 1882 the swarms were increased to 40. We extracted over a ton of California buckwheat honey, and about 200 lbs. of goldenrod honey, and realized \$143.00 from what we sold. White sage was a failure, owing to spring cold and summer drought.

But the main point to be deduced from the above is, that *I am well*, and owe it principally to daily exercise in the open air, which my care of bees makes necessary. I love the work, and am happy in doing it, and mean to make it, in the coming year, my chief means of support. There is much hard work to be done, some suffering from stings, but the last is mitigated by turning smoke upon the spot, after taking out the sting. I know you are skeptical about the smoke, but I have tried it upon persons who had large swellings, and were made sick, until I told them about using the smoker.

We have a new honey-house, a railroad and car, by whose aid the frames of honey will be relieved of their sweets through the extractor, replaced in the car, and pushed back to the hives. As there is a slight descent to the honey-house, gravity will help to move the car.

I am fortunate in never having had a case of robbing, or moths. The only real difficulty is in losing queens when extracting. I shall have to use separators, to keep the queen from combs to be extracted.

NOT ALWAYS QUEENLESS, WHEN QUEEN-CELLS ARE STARTED.

I sent you a card, that the honey Holy-Land queen was lost in introducing, but think I was mistaken. The bees did start queen-cells, but the bees now are grayish, with yellow bands, which corresponds with your descriptions of them.

P. S.—I find, on looking at the above writing, that it is very crooked, which was due to writing in a dim light. Please excuse it. My hands have never entirely recovered from the paralysis of three years ago, and I feel it nowhere so much as when writing. I hope you will continue to prosper. I believe that in so steadfastly upholding the Christian faith by word and act, you are doing much good.

MRS. W. W. WILSON.

San Bernardino, Cal., Dec. 13, 1882.

May the Lord bless you for your kind and cheering words, my friend. Never mind the cramped writing, when it tells of new life, of health and strength gained, and that, too, without the help of doctors or use of medicine. I do believe that the great secret of deliverance from ills of both body and mind is some open-air exercise, with the enthusiasm you show in your letter. Show me an invalid with enthusiasm in bees, berries, flowers, or the like; and if the enthusiasm

is great enough to induce him to push all his remaining energies right into the work, every waking moment, it scarcely matters what the disease is, nature will soon begin to assert herself, and a natural process of building up and growth will commence, and with it comes happiness, joy, and a spirit of thanksgiving to God the Creator. When you get so busily absorbed in some healthful work that you forget your disease, it will forget you, and go off. I have been through it, and know whereof I speak.

#### FROM 19 TO 44, AND 2600 LBS. HONEY.

My bees did very well the past year, considering I had but 19 colonies, spring count. The most of them were blacks, with but a small amount of honey, and some of them were in the old-fashioned beegums. Dr. J. R. Baker was my bee-keeper for two years. I lost all my bees and bee-house by fire in Feb. last. I had then 51 colonies of Italians, so I could buy only 19 colonies, as they were scarce around here. The docter increased to 44 colonies by natural swarming; some went to the woods. We got 2000 lbs. comb honey, and 600 lbs. extracted. We got 15 and 20 cts. per lb. for comb, and 1½ for extracted. No foundation was used in the brood-chamber, and only small starters in sections. We used 2-lb. sections. We built a cave last fall. All my bees are in it, except a few. The temperature is nearly always 45° above zero. Do you think that is too warm for them? I left off the caps, and tacked burlap over the tops of the hives. Do they need water during winter? I am learning to be my own bee-keeper the coming season, if they don't sting me too bad. I think I shall succeed, for women often do harder work than caring for bees. I like Mrs. Harrison's letters very much, and I know we have to work if we want honey. I like GLEANINGS very much, and shall continue taking it while I live.

MRS. ESTER WIRT.

Keithsburg, Mercer Co., Ill., Jan. 20, 1883.

I do not think 45° too warm for the cellar, if it is well ventilated with plenty of pure air. It is rather an unsettled matter about bees needing water; but this we know, that bees do winter nicely without any more water than what is contained in their honey, ordinarily. It may still be, however, that they many times die, where water in their winter repositories would have saved them.

#### A WOMAN'S SUCCESS, REPORTED BY HER HUSBAND.

My wife is determined to have one of your comb-mills, but I can't see where she will get the wax for it. Her bees are all in splendid shape yet. They have not been out of the hives since Nov. 24th. I looked at them yesterday, and I saw they could sting yet. I raised the chaff from one, and they were lively as could be; but the buckwheat chaff is the material for them. Our neighbors are somewhat uneasy about the long winter. Mrs. A. F. E.'s bees stand clear profit for her; and if they die, she is on a balance, and has the honey and combs to begin new. I tell her if some of them die she will have some wax to work on her fdn. mill. We have a spring that is running from 80 to 90 inches of pure water, and 11 ponds, which never freeze over. We have about 16,000 brook trout, from the sack of the egg up to 13 inches; also about 550 catfish, and some German carp. My wife has taken 128 lbs. of one-pound section honey from one colony—the same

frame you use. I call that good. Her 31 swarms average her \$8.00 apiece; her bees are in the yard yet, and some of them could have given 25 lbs. more taken from the brood-chamber.

A. F. EILENBERGER.

Ladensburg, Bradford Co., Pa., Jan. 22, 1883.

#### A NEW PLACE FOR BEES.

There has a swarm of bees come in under the clap-boards of an unoccupied house on our farm, and no one about here knows much about bees. I hoped to find some suggestion that would show me whether I had better try to save the bees, or do as every one says, "Kill them for the honey in the fall." A neighbor had a swarm in his house, and because he hung a hive up by the side of the hole, with molasses on it, and they would not go into it, they are sure I can't do any thing with mine. We found them first last summer. I know of a house within two miles that is full of bees. They have been there for five or six years, no one being able to get them out. If I could get bees out of a house, I should be welcome to them too. Although that house is so full, no hive could hold them all. They have so much room in an old house that they never swarm. Mrs. S. P. HADLEY.  
South Canterbury, Ct., Dec. 28, 1882.

My friend, your difficulty is a very trifling one to any bee-keeper at all up with the times; but it would be pretty hard to give you directions what to do without going through almost the whole science of bee culture. I fear all we can do for you is to tell you to study the A B C book a little, until you know something of bees, and then transfer the bees into a hive, according to the directions in the chapter on Transferring. It would seem as if hives and hollow trees were scarce in your locality, if you oblige the bees to crawl into holes in old houses.

#### MAPLE SUGAR FOR FEEDING.

Mrs. Jennie Culp, one of our A B C scholars, reported at the Ohio State Bee-Keepers' Association as follows:—

I gave each colony 1½ lbs. of maple sugar; had 22 colonies; increased to 30; I extracted the first of June; put the honey in 6-gallon stone jars, to ripen; had over four barrels of extracted honey at fair time (Sept.); extracted after the fair; altogether had nearly 5 barrels of honey. I attribute my success to feeding in spring, and to having plenty of surplus combs. I sold all my surplus honey at 20c per lb.

It was voted that Mrs. Culp had produced the most honey, for the number of swarms she had, of any member of the society.

#### QUEENS NOT LAYING, AFTER BEING MOVED FROM ONE HIVE TO ANOTHER.

I have furnished a few tested queens from my own apiary to my neighbors, and when I caught one very fine queen, and caged her for a gentleman who was standing by, he remarked, "What nice brood, and so much of it!" That queen never laid an egg for him, though he kept her three or four months. On another occasion I furnished another neighbor a queen, and a short time after, when I asked him how his queen was doing, he replied, "The bees received her all right, but she is acting rather strangely. Sometimes I find three eggs in one cell." I was glad that he had selected his own queen, and that, too, on account of the large amount of brood in the hive; but in a few days more he informed me that she was behaving very well.

MRS. A. C. MOSHER.

San Marcos, Texas, Feb. 14, 1883.

## Heads of Grain, From Different Fields.

I COMMENCED last spring with one stand, and it increased to seven by natural swarming. One swarm came to me and threw out another, which makes me 9; two are rather late. I shall have to feed them, which will start them to rearing brood. Will bees winter (especially those that hatch now) without pollen? I want to increase my bees next summer as fast as possible. I don't care for honey till after I get plenty of bees. My bees are in the cellar, the honey-board off, and the frames covered with baize. They seem to be doing well. You can consider me a subscriber for your journal right through, whether I make any thing from bees or not. I shall keep a few for amusement. I have been a bee-hunter for several years, but never have been situated for keeping them till now.

E. C. EAGLESFIELD.

Poy Sippi, Waushara Co., Wis., Jan. 26, 1883.

Why, if you keep on at that rate you will have plenty of bees for a beginner, in about one year, friend E. I am glad to see your enthusiasm; for if you hold to it, you are almost sure to succeed. In fact, I have sometimes thought old bee-hunters are, as a rule, good bee-keepers; for a man who has the grit to hunt bees will be pretty sure to hang to them when he undertakes to keep them. I believe it is generally agreed, that bees winter as well, or better, without pollen.

### BITTER HONEY.

I visited bee-men in Wilkes, Alexander, Caldwell, and Catawba counties in July, 1882. All gave reports of bitter honey. Some of them have since lost heavily in bees. From what source do they obtain the bitter honey? There was a little of it here, but not much.

H. A. DAVIS.

Moretz Mills, N. C., Jan. 8, 1883.

Several conjectures have been made in regard to the plant that furnishes the bitter honey, but I believe we have nothing very positive. It seems as if some one suggested the honey might have medical virtues, like quinine, but I don't recollect just now where it was.

### BEEES BY THE POUND TO UTAH.

Last season I sent for a queen and  $\frac{1}{2}$  lb. of bees. Twice they arrived nearly all dead; the third time they came to hand in fine condition (too late to gather honey, but made a good stand of bees). There was a small comb in *this* cage, attached to the center, which I think is a very good idea. They built, as I suppose, a small comb on each side of it, which I found to contain eggs.

W. W. TAYLOR.

Lehi City, Utah Co., Utah Ter., Jan. 16, 1883.

I am very well aware, friend T., that bees should be put up so they will build comb, and have the queen lay eggs on the way; but I have been trying almost ten years to manage so as to give food and drink in such a way we can do this every time, but we only now and then hit it. In your case we gave water on one side, sugar candy on the other, and a section with a stout comb in it, partly filled with honey. If we could always get plenty of these partly filled sec-

tions with good strong comb in them, without costing too much, I believe it would be just the thing.

### WIND-BREAKS, ETC.

In regard to wintering bees, I read of so many that have taken their bees out of the cellar with the dysentery, I was always afraid to try the cellar. I will tell you how I winter my bees. I have them on a south hill-side, and I put a solid board fence around them,  $6\frac{1}{2}$  ft. high, which breaks off the cold north wind, and I have fruit-trees set inside of fence, as I think in a very appropriate way for shading, aside from the value of fruit. I always winter on the summer stand, with good success. I scarcely lose any since I have learned to look after them in the fall. My bees paid me first rate this season. I sold \$206 worth of honey, and I could have sold more, but I did not like to rob them very closely. I had last spring 20 stands; I now have 33, all in good condition.

S. W. SUESBERRY.

Steeleville, Ill., Jan. 30, 1883.

### HEART'S-EASE AS A HONEY-PLANT.

The bee-plant of this place that I rarely see spoken of, I rank first. It is the heart's-ease, or heart-weed. The kind that yields so much honey grows from 2 to 4 feet. There is a kind that grows 6 or 7 feet high, but the other is the best for honey. It blooms from about July till frost, and the honey is about as good in taste and whiteness as white clover. It grows in corn-fields, and in the small grain-fields after the grain is cut, till frost. There is a small annual shrub, or weed, I think it is called casia, that grows very plentifully in places that the bees work on finely. They seem to work on the stems or branches where there are small blisters, nearly or quite as much as on the blossoms.

EXTRACTED AT 10C., OR COMB AT 18C.; WHICH?

Which will pay me the better, to extract my honey and sell it at 10 cents per lb., or work only for section honey at 18 cents? I never used an extractor.

JOHN HASKINS.

Empire Prairie, Mo., Jan. 24, 1883.

Thank you for the fact of bees getting honey from the stems and branches as well as from the flowers, friend H. I should advise you to raise comb honey, at the prices you quote; but there are many who would think differently.

### HOW FAR BEES FLY.

I see in your comments upon friend March's article in Dec. GLEANINGS, you ask, "Can a bee fly 90 miles an hour?" P. H. Elwood gave, at our N. E. Convention several years ago, how bees had been let loose from a train of cars moving 30 miles an hour, and they, describing circles, kept up with the train, which would make 90 miles an hour. I think I have given the statement somewhere, and it is probably what friend M. refers to. If you will turn to page 152, Vol. 3, GLEANINGS, you will see how you have been converted from a "doubting Thomas" to a believer.

G. M. DOOLITTLE.

Borodino, N. Y., Dec. 4, 1882.

I knew you had something somewhere in regard to the matter, friend D., but it did not occur to me at the time. I own up, and beg your pardon; but for all that, I must still hold that *our* bees do not, as a rule, fly more than about three miles, or at least they did not when we had the first Italians

in the county. The season or circumstances may have had something to do with it, but I watched very carefully, and even took buggy-rides out into the country, to decide the matter, and, no matter which way we went, the Italians grew scarcer and scarcer on the clover-heads, and finally disappeared altogether, after about such a distance. I may have forgotten exactly what the distance was, but it seems to me we found none further than 2½ miles from our apiary.

Bees have done well here this year. My 24 hives averaged about 50 lbs. to the hive.

MATRIMONY VINE.

I have a shrub growing in my garden that I think is the best honey-plant in the world. It is called the willow jessamine (I don't know its botanical name); it blooms from April till October, and the bees work on it from morning till night, and in wet or dry weather. The bloom is about the size of barberry, and the color of lilac; it ripens but few berries; it suckers quite freely. If you are not acquainted with it I will mail you a sprout, if you desire it. I have tried most of the honey-plants, and think this the best. Don't think I am trying to humbug; I have no plans for sale. S. S. JOHNSON.

Hudson, Mo., Dec. 26, 1882.

From your description, friend J., we pronounce the plant the matrimony vine, which we have several times mentioned, and have growing in our garden. It does at times furnish quite a little drop of honey, but I do not as yet see how it can be profitable, cultivated as a honey-plant.

REPORT OF AN A B C SCHOLAR.

The January GLEANINGS has arrived, and I am delighted with it. As there are a great many reports in it, I send you the following taken from my account:—

By 15 colonies, - - - - -	\$75 00
By 37¾ lbs. honey, - - - - -	75 48
Total receipts, - - - - -	\$150 48
To 2 old colonies in April, - - - - -	\$10 00
To 3 swarms in June, - - - - -	12 00
To hives, - - - - -	10 50
To sections, frames, etc., - - - - -	8 52
To queens, and comb fdn., - - - - -	22 87
Total expenses, - - - - -	\$63 89
Balance profits, - - - - -	86 59

I have counted the bees at \$5.00, but could not buy them for that, as they are in large hives, and are heavy. The honey was all in the comb, mostly in 1-lb. sections. My best colony made 130 lbs., and the most made in 24 hours by one colony was 8¼ lbs.

AGE AT WHICH BEES GATHER POLLEN AND HONEY.

Will bees gather pollen and honey at the age of five days?

I have used neither tobacco, liquor, nor profane words for nearly five years. CHAS. VAIL.

Michigan City, Ind., Jan. 28, 1883.

You will see by referring to p. 57, 1882, that friend Wiltse decides they do not attempt to gather honey until about six days old, and no pollen until about the eleventh day. I am inclined to think, however, that young bees do sometimes gather pollen at a much earlier age than his experiment indicated. Glad to know you are a "clean" man, friend V.

A HONEY-BEARING HONEYSUCKLE.

I have a plant, a kind of honeysuckle, that blooms in midwinter; and last February, when I brought my bees home, they covered it from morning till night, and got large quantities of pollen and honey from it. I do not know the name of it, and have raised it only from layers as yet.

T. L. WASHINGTON.

Nashville, Davidson Co., Tenn., Dec. 5, 1882.

Friend W., we should be very much obliged for a small slip of this plant. Can any of the brethren tell us more about it? Why *shouldn't* a "honey" suckle bear honey, I should like to know?

FROM 3 TO 14, AND 400 LBS. OF HONEY.

I commenced with three colonies—one Italian and two hybrids. I had 8 natural swarms in May, and 4 in June, making 12 in all; two went to the woods for me, so I have now in all 13 colonies, all strong in bees and honey. My bees made me a little over 400 lbs. of nice comb honey, and the brood-combs were nearly solid with honey besides, after the honey season. My hybrids yielded me more honey than the Italians, but they paid me well for it by stinging me much oftener. All things considered, I like the Italians better. I never have a bee-vell, nor any protection about me, when I work with the bees.

W. R. DUM, 3.

Elliottsburg, Perry Co., Pa., Jan. 29, 1883.

CELLARS AHEAD, WHEN IT IS 60° BELOW ZERO.

We are having the coldest weather here ever known. Jan. 22d the thermometer marked 60° below zero; the mercury went into the ball here; the air was as white as a heavy fog; every thing was snapping. I think bees will not winter very well here this winter, especially those out of doors. I have 5 packed in chaff, outdoors; they are diseased some now. I don't expect to get them through the winter, safe. I have got 29 in the cellar in apparently fair condition. If this cold weather holds on long, I do not think outdoor wintering will succeed very well in this part of the country. G. W. WILSON.

Viola, Richland Co., Wis., Jan. 23, 1883.

FROM 6 TO 17, AND — NO HONEY.

I had six hives of bees last spring, from which I got 11 swarms by the old method of swarming. We did not get much surplus honey here, as we had a very rainy spell in June and July. There was plenty of white-clover blossom, but very little honey. I am now wintering 14 swarms; 10 of them in frames, and four in boxes. Two of my frame hives are two-story, something like the Simplicity, and I like these better than any I have seen here; they are so convenient for holding the small sections, and they come out cleaner than by any other plan. The bees can not get at the outside of the sections to cement them. I find that we could get hives and sections from the U. S., but our national policy, as it is called, puts 25% duty on hives, and that stops us.

WILLIAM MOWBRAY.

Lambton, Ont., Can., Jan. 23, 1883.

I presume you already know, friend M., that I would not be in favor of duties, any more that I would be in favor of patents, or any other kind of monopoly. I like to see all men have a fair chance, and believe it is with nations as it is with children. The fewer rules and restrictions we have, the better, providing always we do not let liberty run into license.

## FROM 6 TO 20, AND 300 LBS. COMB HONEY.

I thought I would send you a few lines and let you know how bees did in this vicinity the past season. I commenced the season with 6 swarms; increased to 20 by natural swarming; got about 300 lbs. of honey, all comb, in sections, and about 100 lbs. in frames for spring feeding, if necessary. I had my first swarm the 24th of May, which was a hybrid.

## A SWARM DETERMINED TO ABSCOND.

My second swarm was one I had some trouble to stop. They were bound to go to the woods; and as the swarm had my best purchased tested queen, I felt like making them stop, which I did after they had got about ten rods from the hive. I stopped them with a looking-glass. Well, I hived them, and they did first rate; filled their hive with brood and honey. But in just 30 days the same tested queen led out another swarm, and I was about half a mile from home. I heard the bell ring, which told me the bees were swarming. By the time I got home, the swarm had got under full headway, in spite of all the efforts of wife and children to stop them. I followed them for about a mile, and they went into the body of a large white-oak, about 50 feet from the ground. I did not want to lose my tested queen, so I went to the owner of the tree and got leave to cut it, which was no little job, as it was four feet through at the base. They went in at about 10 in the forenoon, and I cut the tree the next morning, and I found them in a nice hollow of the tree, and the hollow was full of old comb, nice and clean; probably it had been cleaned and kept so by my bees. I think they intended to go to that tree when I had such a time to stop them the first time they swarmed. They were in the tree about 20 hours, and the queen had laid in a large number of the cells. She left eight sealed queen-cells in her hive when she went to the woods.

Hillsdale, Mich., Jan. 21, 1883. FRANK RAY.

## REPORT FROM AN A B C SCHOLAR.

As my bees are in their winter quarters, and are so far all right, I will send in my report. I began in the spring with five colonies, in good condition.

## APPLE HONEY IN BOXES.

During apple-bloom it was rather cool; but the bees did well, and one colony stored some 20 lbs. of surplus. I must here say, I never knew apple-bloom to hold on so long as last spring, being nearly three weeks. May 15th I put twenty 1-lb. boxes on my best swarm, and the 25th they were nearly ready to take off; all apple honey. I tell you, I felt good all over at that; but it is nothing new to you, I suppose. But it again grew cold, and there was a suspense of some ten days; in fact, all through white clover it was too cool and wet to get much, but still they kept up breeding lively. June 23th I hived my first swarm, and three more the first week in July, so you see I did not get much from my increase. One swarm got away. I let my little brother watch them, and he says he got "tired," and went off to play. I will now relate what I saw last summer.

## HONEY FROM HOYA AND JAPAN LILY.

I saw the bees working hard on mother's Hoya all summer. We have a fine specimen covering a frame about 3x8 feet, very densely; it is a beauty. I really wish you could see it when in bloom. I also saw them work on the most beautiful of Japan lilies, the "*Lilium auratum*." There were great drops of honey on all the petals all day. As soon as they had carried off a drop, another would form, and so all day, until darkness compelled the bees to leave un-

til the morrow. Now for my report: Started in spring 5 swarms; increase, 4; went to woods, 1; surplus full boxes, 327; surplus partly filled, 115. I am satisfied, for I am away down near the foot of the A B C class. Have sold most of my honey at 16 cts. Now a few questions: Did the little earth-flea ever bother your spider plants? I set out some 200, and in less than 24 hours had not one left.

OTTO G. JOSENHANS.

Owosso, Shia. Co., Mich., Jan. 22, 1883.

Will you please tell us if you found the apple-tree comb honey good for table use, friend J.? We extracted some one year, but none of us liked it.—I have seen the honey run out of the Japan lily, but never saw the bees at work on them. Our spider plants have never been molested in the open air at all; but a green worm ate up a lot of them one spring in the greenhouse. Did you not set out the plants when they were too small?

I began the season with 16 stands, and increased to 42; have taken 1000 lbs. of extracted honey, about 500 lbs. comb; 35 stands I have in cellar; the rest on summer stands. Bees swarmed more in August than any other month this year. One swarmed five times, and I put them back every time; at last I took away all their combs, and they stayed. This was August 23; they now have 30 lbs. My bees are all very heavy in honey and bees. What would you give for a barrel of nice honey?

Oakley, Ill., Dec. 23, 1882.

FRANK BAKER.

We have been paying 10 c. for clover and linden, friend B., but just now we have more honey than money. Isn't that "funny"?

## HOW A NEW-ZEALAND FRIEND MADE HIS OWN FOUNDATION, ETC.

This is only the second season that I have tried frames, and I have succeeded beyond my expectations, as I have had to work under a good many difficulties. In the first place, I could get fdn. only in a roundabout way, with two shipments, and then only at a good stiff price, and bees would have to work hard to make it up; so I got a bit of comb and a bit of starter, and had a good look at both, and tried to make a press to make comb for myself. After repeated failures I at last managed to make one with common shoe-nails driven in wood, and filed up; I put five nails to the inch every way. I have two pieces; one bosoms in the other; and when I place a thin piece of wax between, it leaves the impression of the nails on both sides. I managed to get some of them in the boxes last season, and the bees worked very well on it. Still, it is nothing so neat or well done as the fdn. that is sold in the shops. JOHN BLAIR.

Tryphena, Gt. Barrier, N. Z., Oct. 29, 1882.

## DISPENSING WITH SECTIONS.

While everybody is crazy about ½-lb sections (but me), I have a suggestion. Let us get our comb honey in the brood-frames. Then, having been to the tin-shop, get strips of tin, say 1¼ inches wide, and of a length that, when fo'lded in the form of a hollow square, will just inclose half a pound of comb honey. The tinner might bend the ends of the strips into the form of hooks, then any one with a block of wood of the right size can bend them into squares, and hook the ends together. Now lay your brood-frame, filled with nice comb honey, flat down, and

with one of my (celebrated) squares commence at one corner and press the square through the honey-comb, then another square right by the side of it, and so on till the last inch is filled and inclosed with these tin frames. Now set the whole thing back in the hive an hour or two, and let the bees slick up the edges, then take the thing out, unpack, and set away in the store-room. Or, instead of filling the brood-frames with these squares, remove each one from the frame as soon as it is pressed into and through the honey, and set it in the crate, allowing room enough between the squares to allow the bees to clean them all up nicely. Now I won't say eureka until *you* and all the big guns of the fraternity have had a chance to annihilate this whole letter. If any thing good comes of it, I will be on hand for a share; but if not, just bear in mind it is only an A B C scholar heard from, and let the wood-section men keep right on cutting up carloads of lumber for the summer trade.

F. A. PALMER.

McBrides, Mich., Feb. 3, 1883.

Friend P., I did just that thing, years ago; but it was a dauby, sticky mess to handle, and the bees, instead of cleaning them all up nicely, just dug the comb out all around where the tin went, and it didn't succeed at all. I don't believe we can depend on the bees to turn in and help on any such device.

#### FIGWORT FOR HONEY, AND FOR SEED.

I have made a failure in the seeds of spider plant and Bokhara clover, but I regard the figwort as a treasure. It grew to be 7 or 8 feet high, with garden culture, with many and wide-extended branches, full of tiny blooms (honey-cups), from about the middle of Aug. to the middle of Nov. They were visited by swarms of bees, butterflies, wasps, yellow-jackets, and all honey-loving insects, from dawn till twilight. Neither the poplar nor the linn was more visited. If a bee-keeper had five to ten acres, well set in figwort, I think he might calculate pretty surely upon having enough honey to carry his bees through the winter and spring, if every thing else failed.

This brings me to what I set out to say, or, rather, to ask.

#### WILL IT PAY TO GROW FIGWORT SEED FOR SALE?

It may kill two birds with one stone. Have the bloom for my bees, and the seed for sale. What will you offer me for such seed as I may have for market next fall? or what will any one else offer me, and who will it be? If I can get a remunerative market, I think I shall plant pretty largely next spring.

Columbia, Tenn., Dec. 22, 1882. W. S. RAINEY.

I can not tell you what I could pay for seed next fall, friend R.; but we have been paying \$1.00 per lb. of late for it. I know a very good thing could be done raising seed, at any thing like present prices, but demand and supply regulate all these things. It is some labor to get the seed nicely separated, but we found by sifting it in the wind, when there was only a very light breeze, we could get it comparatively clean, and then by sifting it through perforated tin, having the right-sized perforators, we get it very nice and clean, with comparatively little trouble. It may be that many have been deterred from saving the seed, by the difficulty of getting it clean, by ordinary means.

#### WIRING FRAMES FOR FOUNDATION.

I like wired combs, but find that when the wires are put through the top and bottom bars they will not prevent the frames from sagging when 6 or 8 lbs. of honey are put into a new comb. I have a lot of wired combs now that will crush bees in the bottom of the hive. The weight of honey causes the wire to cut into the wood. Another thing: It is almost impossible to get wax or propolis off the frames without cutting the wires when they run along the outside of the frames. Could you not cut hooks from tin, instead of the wire staples suggested by C. H. Deane, on page 615? I think the second form would be best. They should be long enough to clinch, which might be done by the bars being laid on a bar of iron, when driving them in. Please let me know as soon as possible your opinion of the above, as, if you could make them work, I would cut out my frames accordingly.

A. G. WILLOWS.

Carlingford, Ont., Can., Dec. 8, 1882.

Your tin staples will answer, without doubt, friend W., but it will be a rather expensive job to drive and clinch them, I fear, and, if not clinched, I fear they would pull out, with very heavy combs, and then we should be as badly off, or worse, than with the wires that cut into the wood. The last-named feature has been of service to us, in making the wire cut into the wood a little, when it would be too tight otherwise. We have never known combs so heavy as to make the bottom-bars sag, but we use entirely No. 30 wire; in trying to use No. 36, we had some trouble such as you mention. We never scrape the top-bars so close as to cut the wires. Friend Doolittle says he does not want his top-bars scraped at all, for the wax on top is the very best thing to induce the bees to go up into the sections above. Some kind of staples, or tin points, that could be put in rapidly enough, and would not pull out, would be quite desirable; but I am a little afraid we shall not be able to do it.

#### THE FLOOD OF HONEY IN INDIANA.

Last spring, when the fruit-bloom opened, April 7th, bees fairly tumbled in with their heavy loads of honey. On the 10th we had quite a snowstorm, and freezing, which destroyed all the bloom until June 4th; then the raspberry and blackberry bloom opened. Bees went for them with a rush, as at that time they were short of stores, and some colonies actually starving; most of them had their drones all killed and dragged out of their hives. First natural swarm issued June 6th; on the 10th I commenced extracting. On the 29th, basswood bloom opened up nicely; bees gathered honey rapidly from this source till July 13th. Next was white-clover bloom, which lasted up to Aug. 15th. Then the late sumac bloom opened, fairly dripping with honey, which gave the bees all they could do till September 1st; then the fall bloom opened, which lasted till the 1st of October. Swarming was kept up through all this continuous honey-flow. Of course, we obtained a nice crop of honey, and have our bees in splendid condition for winter.

WM. PARMERLEE.

Bean Blossom, Ind., Dec. 2, 1882.

This is quite interesting, friend P.; but most of us would like to know just how much honey you did get, and how many bees you have. You see, we bee-folks are "naturally inquisitive like."

## A WINTER ENEMY OF BEES.

I send you by to-day's mail a specimen of a bee-mole that sometimes does serious harm to bees in this part of the country. My bees have been confined to the hive since Thanksgiving, until yesterday (Jan. 30), when they got a good fly. I took off the cushions and quilts, and let in the warm sun, and they flew out in large numbers, and covered every thing with their discharges. In opening one of my chaff hives that was strong last fall, I discovered that the bees were nearly all dead, and that the combs were gnawed along the top-bars. I proceeded to investigate, and found three of these little "varmints" down among the dead bees at the bottom of the hive. I destroyed them all, and charged up \$7.00 to the account of bee-moles. The one I send you is the largest one of the number. They passed into the hive through the entrance, which measures exactly  $\frac{3}{8}$  of an inch. They consume all of the bee except the head and wings. They do not injure the combs very badly. Their presence in the apiary may be known when snow falls, by their roads under the surface of the snow; traveling as the common ground-mole does. They seem to be able to pass into the hive through an opening that will permit a bee to pass through; and as soon as they become gorged are unable to pass out again. They are a very small animal, yet able to do a great deal of damage inside of the hive.

Bees have suffered badly during the past part of the winter — worse, I think, than they did during the winter of 1880-'81. The temperature has not been so low as it was during that winter, but the bees have not lain dormant as they did then, and have consumed more honey and pollen, and have not been able to get out and empty themselves, and they have discharged in the hive, and the result is, that weak colonies have nearly all died with diarrhœa. I think that the experience of bee-keepers this winter will tend to make the question, "How to winter bees," more difficult to answer than ever.

## REPORT FROM ONE WHO SELLS BEES INSTEAD OF HONEY.

My report for the past year is more satisfactory than any former one. I turned my attention to raising queens and bees, and offering them for sale. I made a specialty of five-frame nuclei, which sold readily at fair prices. I began the year with 23 colonies; sold 40 5-frame nuclei; increased my stock to 46 colonies; extracted honey, 450 lbs.; comb honey, 400 lbs. I expended about one-half my labor in working with my bees, and manufacturing hives and comb fdn.; the remainder of the time I spent working at my trade. I satisfied myself, also, that bee-keeping is a remunerative occupation, and propose to devote my whole time to the business in the future.

WILLIAM LITTLE, 46.

Marissa, St. Clair Co., Ill., Feb., 1883.

## TESTING CHAFF HIVES, ETC.

You have the chaff hive, and use it, I think. Will you take an empty hive, put in it a dish of water, then fix it as you would if a colony were in it; let it be fully exposed to the weather, and then note how low the thermometer may run, whether to zero or not, without ice showing in the hive thus prepared, and give me your results, as I am experimenting a little in that direction, but with a different material, and I'll change results with you. The great problem to solve is, how to winter our bees successfully. If I can get a hive, and as cheap and light as a single

wood hive, and yet so warm that water won't freeze with thermometer marking zero, or even 6° to 10° above, I think I'll have a success for our climate, as we usually have so few days as severe, or more so, than that, that the bees can stand it until something better is found. I am hopeful, but not satisfied, so far. If I can make it to reach zero, and no ice, I shall be fully satisfied, feeling I have a success for bee-keepers.

Ypsilanti, Mich., Jan. 20, 1883.

I think, friend A., you have fallen into a very common error. If you allow time enough to elapse, the water would freeze up solid in any chaff hive you can make, as I understand it. The trouble is, that a dish or pail of water does not produce or give out heat, like a swarm of bees, or as a living animal does. It contains some heat, of course; but after this is gone, it gets just as cold as the surrounding substances. If well packed, or blanketed, it would keep the water a longer time without freezing, it is true; but a swarm of bees would keep the interior of the chaff hive warmed up permanently, because the covering retains the animal heat they are constantly generating and giving off. For the same reason, clothing warms our bodies, or keeps the heat from falling; but if clothing were put over a block of marble, standing out of doors, it would not change the temperature of it as single degree, by the thermometer, no matter how many overcoats or shawls we brought into requisition.

## THE GREAT HONEY-YIELD IN IOWA; WHERE DID IT COME FROM?

The past summer was the most profitable one known to bee-keepers since the settlement of the State. Bees stored most fabulous amounts of honey in this part of the State. You probably would think the story was a little "fishy," if I should tell you the amount of increase and honey many of us obtained from a certain number of hives. The honey was of the best quality. The spring was wet, cold, and backward; in fact, the whole summer was wet and cool, and the impression of bee-keepers was, that the business would be a failure for the summer. But about the 10th of June bees began to swarm and store honey rapidly, and continued to do so until the 14th of Sept., when the weather became too cool, and was soon followed by slight frosts. Now the question is, To what do we owe this unusual success? The basswood bloomed about as usual here, and the bees seemed to store about the usual amount of honey from it; but soon after it went out of bloom they began to store faster than before, and continued to all the summer. The only unusual bloom was a good crop of white clover, but not more so than some former summers. Many days were so cool that the bees did not leave their hives until nearly noon; but still the honey increased in the hives wonderfully. The advocates of honey-dews stoutly contended we had many of them, yet I could discover nothing of the kind. Now, is it your opinion that honey-dews ever occur? Is not the so-called honey-dew the exudation from the leaves of trees caused by wounds from insects?

Oskaloosa, Iowa, Jan. 11, 1883.

B. F. LINDLY.

I am not yet satisfied that honey ever falls as dew, although many claim that it does. Our back volumes contain a great amount of facts in the matter.

## AN ENTHUSIASTIC A B C SCHOLAR.

I have been making hives and fixtures all winter; am making all for L. frames, as I believe that will be the standard all over the land in due time. I bought an old sandpaper machine, and easily made a foot-power saw, which I can do all sorts of hive work on, and don't you think I am so interested that I work up to 10 o'clock and after, every night.

I had 18 swarms last summer; am wintering 12, all on summer stands, but one in cellar. I kept chaff cushions on all summer, and think it a much better way where we are not working the upper story for honey, especially with such a cold season as 1882. I like the looks of your chaff hive better than all others I have ever seen, and I have made one something like them, and don't see how you can sell them so cheap; but I suppose machinery does it mostly.

## HYBRIDS AHEAD.

I have my hives all in the shade of plum-trees, and the one that did best last season was up close to a building on the northeast side, and under a tree at that. This was a swarm of hybrids that I bought and transferred in January, 1882, which were nearly out of feed when I bought them (which I thought was the case), so I just thought I would see what I could do. I transferred them the middle of January, and put them on one frame of honey taken from another swarm in the fall. I closed them on each side with division-boards and chaff cushion. In two days the weather gave them a good fly. I began feeding early, and made one extra swarm by giving them a queen. Now I shall rear a few queens from this one, as she is all I can wish — good to handle, and great workers, let the color be a little mixed or not; wouldn't you? I tell you, friend Root, I just love bees. I got stung all of *three times* last summer, and I transferred a dozen or more swarms too. I do not use a veil; but your Clark smoker is what knocks the temper all out of them.

## SMALLER HOLES IN THE SMOKER-GRATE.

I wish to tell you that I would make the holes through the round tin of the smoker a little smaller, as coals will drop out as they are now. I put wire cloth over mine, but it must be cleared out often, as it is too fine. I spent my Fourth of July in the apiary, and wish I could see you and your city of bees.

E. P. CHURCHILL.

North Auburn, Maine, Feb. 12, 1883.

If I were a honey-raiser, and wanted queens for my own use, I would as soon breed from a hybrid that just suited me as from a full-blood Italian queen; and I am not sure but that I would feel a little safer with a small admixture of black blood.—We have tried making the smoker-grate with smaller perforations, but it is then so much more apt to get clogged, we have chosen the size of holes as we now make them. It is a question between two evils, you see; having the grate clog, or letting small coals of fire out occasionally.

## LARGE REPORTS, ETC.

Many wonderful things in GLEANINGS I see; and without raising a doubt about their truth, I would ask how it was done; what kind of hives; where were the sections put, at the side — near the brood-comb, or on top in crates, etc.? All these particulars should be given, or the statement of the great result is of no use to your readers. The *how* would help me very much, as I wish to know the best way to handle my bees. I have no doubt a

great deal more honey will be gathered some years than others. I would not publish the result unless the method pursued be also given. J. HILL.

Emerson, Jeff. Co., O., Feb. 15, 1883.

I hardly agree with you, friend II. The plan of working is given so fully in every issue of GLEANINGS that it is generally supposed to be fully understood. Where extraordinary results have been obtained, or where some different plan of working, other than the ordinary one, has been used, I believe the friends usually give us the details. I am inclined to think, my friend, you must be a new comer, not yet quite fully acquainted with us and our work.

## ASPARAGUS AS A HONEY-PLANT.

On page 89, H. V. N. Dimmie asks the question, "Is asparagus a honey-producing plant?" I should say it is. Several years ago I lived in a district where fruit and vegetables composed almost the entire crop of the surrounding farms; and within a radius of three miles there was thirty or forty acres of asparagus grown; and as it generally blossomed during a dearth of honey I had a good opportunity to judge its value as a honey-producing plant. My bees worked on it from early morn until dark, and gathered from  $\frac{1}{2}$  to 2 lbs. per day. The honey is light in color, and has a peculiar acid taste, somewhat resembling raw unripe clover honey. It was very thin, and thickened very slowly. It is a profitable crop to raise for market, and would pay well for that alone; but I do not think that it produces a sufficient quantity of honey to warrant a bee-keeper in planting several acres for honey alone; but if a ready sale could be found for the vegetable in spring, it would pay bee-keepers to raise it, thus helping to keep up the flow of honey through the season.

EDWARD S. FOULKS.

New Albany, Ind., Feb. 12, 1883.

## ANOTHER WAY TO BIND GLEANINGS.

This is the way I do my binding of GLEANINGS and other book-formed papers. It might be with others as with myself; they would like to have them bound, but don't like to pay the price-asked to do it. I place them right straight in a pile, the backs all to come out even. Take a  $\frac{3}{8}$ -in. strip of suitable leather; through this drive three  $1\frac{1}{2}$ -in. wire nails; then through the back of the papers; turn around, and lay with the heads on a hammer, and clinch the nails. Take another strip of leather and nail right over the clinches, with  $\frac{3}{8}$ -inch wire nails. You can also make a good leather back by simply taking a wider strip of leather, nailing with  $1\frac{1}{2}$ -inch wire nails, as at first. Nail the leather around the back, and nail over the clinches as before. By this way you can bind them as tight as any book-binder.

WM. K. DEISHER.

Kutztown, Pa., Feb. 10, 1883.

## BLANKS FOR BEE-KEEPERS WHO LEAVE THEIR HONEY ON COMMISSION.

Will it not pay for you or Mr. Newman to get up a blank receipt-book for honey-producers to use with retail dealers in small country towns, where they leave honey to sell on commission? We want a receipt for the merchant to sign, itemizing the different kinds and sizes of packages, and to pay a specified price for all that he sells, and the balance not sold to be returned to the producer. I think our patent-medicine men use something of this

kind, and I think there would be demand enough to pay for getting them out. E. LISTON.

Virgil City, Cedar Co., Mo., Jan. 22, 1883.

Thanks, friend L. Now who among our readers can send us a blank, such as patent-medicine men carry?

"THE OLD WOMAN THAT LIVED IN A SHOE," ETC.

You have read of the "old woman that lived in a shoe," etc.? Well, I have more bees than I want, or know what to do with; and if they swarm as they did last year, I shall be sorely puzzled. I have black, hybrid, and Italians. I haven't time to attend to them. If you get scarce, send me some cages, and I think I could send you a bushel or so. I know I shall have the bee fever when spring opens. As the darkey said, I had a "simsom" of it the other day, when I heard such a roaring in my beeyard that attracted my attention nearly a hundred yards off. The bees were out in fine force. The cold wave has kept them indoors until to-day. I noticed them peeping out, and occasionally one on the wing.

A FEVER THAT EVEN QUININE WON'T HELP.

Quinine will keep off an ordinary fever, but I don't know how to provide against the bee fever. Do you? Ellaville, Ga., Jan. 17, 1883. C. H. SMITH.

Who will help friend S. out of his trouble? Can't Mrs. Harrison tell him what will do when quinine fails? She seems to be quite a wise doctor.

A PLEA FOR PATENT-HIVE MEN.

Judging from a letter lately received from a lady in Alabama, you owe the "Golden" bee-hive man a compliment. She says, "Until last year, nearly every one here used box hives; but the Golden beehive man came along, and he deserves this much credit: he interested many in bees, and opened the way for information. I do not know why it is counted among the 'humbugs.'"

In this letter she says that she has A B C and GLEANINGS; and as this Golden beehive man opened the way for information, he must have told his patrons of your publications. I have been told several times, by persons, that the first they knew of improved bee culture was by traveling patent-hive men, and you should not be too hard on them, brother Root.

Peoria, Ill., Feb., 1883.

I "give in," my friend, that "patent-hive men" are sometimes of value, by turning the attention of people to the subject of bee culture. The yellow fever also turns people's attention to the subject of cleanliness; but I don't believe I should call it a very good thing to have around, though, after all. Can't we learn bees, and be clean, without paying so dearly for it?

OREGON AND WASHINGTON TERRITORY.

I see in your comments on the communication of friend March, of Washington Territory, in August number of GLEANINGS, you ask why they can not raise peaches and grapes, with such a climate as he describes, and then said: "Perhaps it doesn't rain, and you have to irrigate, as they do in California." Now, Mr. March has given a truthful account of the climate. They do not have to irrigate, for it rains enough, I assure you; but the truth is, that any thing will not do well in Washington Ty., or in this portion of Oregon, that requires warm nights to

grow in, for the nights here in summer are nearly always cool, and seldom hot and sultry, as they are in the east. That is the reason why peaches, corn, and melons do not do well here.

HOW FAR BEES USUALLY FLY.

As to the account Mr. March has given, of bees working long distances from their hives, I do not doubt that they sometimes fly several miles through an open country, after flowers, when there are none nearer; but I think that in a country interspersed with timber, bees seldom gather much honey over two miles from their hives. M. E. WARREN.

Portland, Multnomah Co., Or., Dec. 3, 1882.

BEES AND NEURALGIA.

In years past I was a great sufferer from neuralgia, so I can sympathize with Mary Smith (in GLEANINGS); and while questioning myself as to the propriety of sending a prescription to a bee journal, the words came, "To him that knoweth to do good, and doeth it not, to him it is sin." I think hers is a very severe remedy, as a bee-sting makes me sick for several days. I did our extracting last summer. I have never been stung while working amongst them, as I never venture without the armor. I like working among the bees. It is healthful, and quite exciting — enough so for weak nerves.

The following I have taken for years, and it always cured for a time. One oz. tincture of iron; 25 cents' worth quinine; mix. Take ten drops (then increase to fifteen) in about four table-spoons of cold water four times a day. Eat plain food — graham bread.

I like the Home readings, as they do me good. I like the principle of carrying our religion into our working homes. May wisdom be given thee, to lay judgment to the line and righteousness to the plummet of the gospel, is the desire of thy friend —

JANE H. IDYLE.

Heathcote, Ont., Can., Feb. 15, 1883.

Many thanks for your kind words, my friend; but I am almost afraid your remedy is not one to be advised, even though it does bring relief. Your remark, "for a time," covers the whole ground. I believe our best physicians are getting to be a little loth in recommending quinine. Better take the graham bread, and plenty of outdoor air along with the bees.

FROM 1 TO 15, AND 200 LBS. HONEY.

After my loss by fire in Kansas last year, I brought one colony, saved from the burning wreck, and without feeding increased to 15, and 200 lbs. honey. But being in a strait with our church building, I sold them for \$50.00 and put it all into the Lord's treasury. I have now 4 stands of blacks, which I bought very cheap. Our church and S. S. and Band of Hope are prospering. B. of H. numbers nearly 200. C. H. WRIGHT.

Siloam Springs, Benton Co., Ark., Jan. 22, 1883.

Truly, friend W., you have reason to trust in the Lord. With such a locality, surely you will prosper.

THE SQUEAKING MOTH.

Some years ago, when I was living in Nevada City, Cal., my notice was several times called to large beetles, or pinch-bugs, that were brought around the door in the early part of the evening by a young cat, and I soon noticed that they would make a kind of grating or squeaking sound. This noise I found

to be produced by their rubbing their back legs together against the sides of their bodies. By holding them between the thumb and finger, so that they could work their legs freely, it was easy to see how the squeaking was produced. I have two specimens now in a cabinet.

#### THAT PLAN FOR A HONEY-HOUSE.

You are right when you say that no one plan will suit all bee-keepers any more than any one plan for a dwelling will suit all persons. You were also perfectly safe when you said you would give a hundred dollars for a honey-house plan that would "just suit you." I saw the "ketch" at once, and therefore did not spend much time on it; but it seems all did not see the "point." A hundred or a thousand plans might be sent you, and it would be an easy matter to say that not one "exactly suited you." I never considered it as a real *bona-fide* offer of a honey-house plan as it read.

A. A. FRADENBURG.

Port Washington, O., Feb., 1883.

Thanks for your fact in natural history, friend F. I believe insects, many of them, utter notes of distress or alarm in a way similar to the one you indicate, and yet they are as truly tokens of their feelings as if they did it with their mouths. Bees indicate anger or joy by the hum of their wings, and I presume other insect tribes do their talking in other similar ways, or, if I may be excused, in whatever way they have found, by long ages of practice, to be handiest.—I assure you, friend F., I had not the remotest intention of having any "ketch" in what I said about honey-houses, although it is true I did not expect to pay anybody just now for plans and specifications. I simply used the expression to indicate how much I thought we needed something of the kind. It seems to me that none of us know now just what we shall need. When we do I am ready to pay even more than that, to have an architect work it out.

#### ABUTILON, AGAIN.

I see you inquire about flowering maples, so I will try to give you my experience. My brother's wife has two large maple-trees, full in bloom. I don't know the full name. The leaves are green and yellow spotted, very attractive to the eye. One day she came to visit me, or, rather, say family, and brought me one of those beautiful maple flowers along. She knows I am very fond of flowers, and so she did that to please me. After my inspection or examination I found it to contain about 3 bee-loads of juice, or secretion, which had the finest flavor, or the nearest taste to natural honey, I ever saw. I think it a very fine honey-plant, if we only had enough of them. Please say what you think of it. Now, friend K., I have one question for you to answer: My hives are all facing the south sun, so you see the noon sun strikes the front of the hive very heavy by this time of the year. Monday last was a very clear day, but the wind has been so heavy and cold that most of the bees which left the entrance to any extent, were checked by the cold wind, fell down on the snow, and there they are sleeping yet, fully two swarms, I believe. That is interesting, boys, isn't it? Some of the stocks haven't been out for quite a little time, so I concluded to let them go, providing they were out every week or so. I think

I should have shoveled up the entrance with snow, to make it dark inside. If convenient, answer soon how you would proceed under such circumstances, as I might get in such a fix again, ere long. You never answered me many questions. I will see what you will do this time.

D. E. BEST.

Best's, Pa., Feb. 14, 1883.

I am very glad to hear you corroborate the good report from Abutilon, friend B. It seems to indicate that it is a regular habit of the plant to secrete nectar in this way.—As a rule I do not believe bees get out and get lost in the way you mention, very much, when they are in a state of health. This being the case, I have not very much faith in shading the entrances, or fastening them in their hives. Shoveling snow over the entrances might cool off the hive so they would not come out, or it might do a better thing by furnishing them the water they were going out after, and thus reduce them to quietness.—There are several reasons why I do not try to answer all the questions sent me; but the greatest is, that it is beyond my power, without neglecting other matters that I can not neglect conscientiously. The questions I pass over are, for the most part, because I don't feel as if I could give any valuable light on the matter, like the one you have just asked, friend B. I have just now been thinking of a shorthand writer; but they usually command great pay, and I am afraid they would not write just what I wanted said, even then. Thanks for your gentle reminder, friend Best, all the same, and I will try to do better.

#### ANA B C SCHOLAR WITH 83 COLONIES TO START WITH.

I am an A B C scholar in bee-keeping. Last spring I took on shares from a bee-keeper who was about to move to Colorado, 83 swarms—Italians, hybrids, and blacks, all in chaff hives. I never saw the inside of a hive before. I bought a second-hand A B C book, and borrowed GLEANINGS from a friend. As long as I keep bees I must have GLEANINGS. The past season was very poor for bees in this locality; but very few swarms issued. Instead of having an increase I went into winter quarters with only 70 swarms. Inexperience, starvation in spring, and moths, was what caused the decrease. I got about 1000 lbs. comb, and 600 lbs. extracted honey; sold the extracted honey for from 10 to 12½ cts., and the comb, from 15 to 20, per lb. Honey was mostly from white clover.

#### HANGING OUT.

A great many of my swarms in hot weather last August would hang out on the entrance-board, in big bunches, sometimes almost covering the front of the hive. I supposed they were going to swarm, but they did not. Whenever they hung out I took off the cover and set it crosswise of the corners of the top of the hive. If they could have been made to go to work it would have greatly increased the flow of honey. If an entrance were made in the upper story, in front or behind, would it not have allowed sufficient ventilation, so that they would have gone to work instead of "loafing"?

#### A "DUMMY" ON THE UPPER STORY.

In putting on an upper story, nine section frames do not fill it, so I put in one brood frame, which fills the space. Now, suppose I put a division-board in, instead of the brood-frame, would not the bees store

the honey that would have gone into the brood-frames, in the section boxes? CHAS. BALLAMY.

St. Clair, Mich., Feb. 18, 1883.

A division-board, or "dummy," would cause the bees to put the honey in the sections; but if your hives are of such a width, I would rather have a few frames of thinner sections, and then you might test the advantages of thin and thick sections, side by side.—I do not think an entrance into the upper story advisable: it often induces the bees, queen and all, to vacate the lower story, and go above. Better shade the hives, or give ventilation at the entrance below.—I think, friend B., you would have made the season more profitable, had you sold all except about from 15 to 25 of your colonies, until you had had a little more experience.

#### FROM 32 TO 65, AND 1800 LBS. OF COMB HONEY.

I commenced in the spring of 1882 with 32 hives, mostly weak ones. I got 1800 lbs. of section-box honey, mostly from Spanish needle and honey-dew and bee-weed. I have 65 stands at present, all rich and strong; sold 8 swarms; had 14 run away, mostly Italians. I did all my work myself, and raised 500 bushels of corn from ten acres of ground; also five acres of buckwheat; got considerable seed, but no honey.

HIRAM PEER.

Ellis, Ill., Feb. 7, 1883.

Pretty well done, I should say, Hiram.

#### A SUGGESTION IN REGARD TO SPRING DWINDLING.

Our president, Mr. S. I. Freeborn, said at our convention this winter, that he had noticed (after an experience of 25 years) that bees that had been wintered in a very low degree of temperature were always the *most* affected by spring dwindling. Have others noticed it? He said, that if they were kept warm enough so they would carry out their own dead bees he thought the conditions about right, and that none but diseased or old bees would leave the hive if kept dark. Is this not about 5 degrees above the law? I will give you a "brief" of our

#### CONVENTION REPORT.

We have 23 members, of which 13 were present, and reported 787 colonies, spring count; condition fair. 1249 colonies, fall count; condition good.

Produced, light comb honey	- - -	2,980 lbs.
" " " " " " " " " "	- - -	43,400 lbs.
" " " " " " " " " "	- - -	18,450 lbs.

Total	- - - - -	76,130 lbs.
-------	-----------	-------------

Had the other members reported, I think we could have swelled the amount to nearly 50 tons, as one of the members, I have since learned, had 10,000 lbs. So you see we make sweet enough up here among the basswoods to sweeten up a big batch of glucose, so city folks can eat it.

M. A. GILL, 40,

Viola, Wis., Feb., 1883.

Sec. P. B. K. A.

#### A "CORN-SHELLER" BUZZ-SAW.

I want a circular saw, one for making bee sash by hand power, rigged to a corn-sheller. I have a good heavy fly-wheel, and good speed. I want it for ripping out sash, or suited to a little cross-cut use. Now, what sized saw and gauge will you recommend and furnish? I have a mandrel for one-inch hole.

Parker's Landing, Pa., Feb. 14, 1883. H. H. SAY.

Many thanks, friend S., for your novel suggestion. The machinery for running a corn-sheller is just about what we need for a hand-ripper; and although some of the

brethren may laugh, I tell you the laugh may be eventually on our side. I wonder now that it never occurred to me before. I am sure the manufacturers of corn-shellers might, by a very little change, give us a hand-power saw at about the same price as a corn-sheller. I would advise about 10-inch saws; and if they could be firmly set on the same mandrel that carries the balance-wheel it would give the best results, I think. This shaft should be about 3 feet long, so that the balance-wheel need not be in the way of long and wide stuff, and the crank would be best near this wheel. With such a machine a couple of good men ought to make hives pretty fast. As the turning would be harder than feeding the stuff, they could change about; or if "orders" were rushing, a third man might assist, and then one could be resting, or doing some light work, about a third of the time. A 10-inch saw, geared so as to have about the speed of a fanning-mill, or a little more, will do very effective work.

#### HONEY ON THE HONEY-HOUSE FLOOR.

Those who have honey in combs hanging in the honey-house never seem to speak of its dripping, and daubing the floor. Would it not be a good plan to have large square shallow pans to catch the drip? It looks bad to see it on the floor. A. B. OSBORN.

Spring Bluff, Adams Co., Wis., Feb. 12, 1883.

You are right, friend O. I would not have honey daubed on the floor, under any circumstances. Our combs are always hung in spare Simplicity hives; and, by the way, are we sure any better comb-closet can be invented than they make when piled one over the other? Well, to keep the floor clean we have for years used shallow tin pans that a Simplicity hive will just stand in. They are in size about 16½x20½, and the edge is turned up about ½ inch, and soldered at the corners, so the honey never runs out of them. Where the floor was uneven we used to have some trouble with mice gnawing under the bottom of the hive; but with these large dripping-pans, we have a sure thing on the mice. When the pans are not in use under the hives they are nested and set away. In green-corn season they are handy for drying corn. We can make them for 15 cts. each; \$1.35 for 10, or \$12.00 per hundred, if any of the friends should want them.

#### A TOMATO THAT BEARS HONEY.

I wish to ask you or your readers if there is any special merit in the Strawberry tomato, or ground-cherry, as a honey-plant. I noticed my bees on the blossoms almost constantly. They bloom when six inches high, and continue in bloom all the season. This plant is quite rare in some sections, although it is a very valuable fruit indeed. I have raised them several years, and esteem them above any other fruit for canning or preserving. Perhaps some of your readers will be interested in a description of them. They are an entirely distinct species of tomato; are about as large as ox-heart cherries, and grow in a pod, or husk. They are of a bright yellow color, and have a strawberry flavor. They will yield wonderfully; are cultivated like tomatoes, and will keep, in their pods till mid-winter, if desired. Now, if it should be that they are valuable for honey, it

would be a strong point in their favor. I have saved a fine lot of seed; and if any of your readers wish to try them, I shall be pleased to mail them a package, if they will write to me and inclose stamp. I have kept bees but one season; have had just enough success to feel hopeful.

A. T. COOK.

Clinton Hollow, N. Y., Feb. 16, 1883.

## A NEW WAY TO PUT UP SIMPLICITY HIVES.

Saw out corners the same as for chaff hives, only use 1½-inch plank, instead of 3-inch. Use 16 screws to a hive. In the fall, when you put your bees in chaff hives, take out the screws, and your hives will be in the flat, so you can pack them away in a very small place.

## MOLLY HEATH HONEY-PLANT.

We have a plant three years old; has never blossomed yet; it stands about 38 inches high; the leaves are very handsome. We are keeping it in hopes it will blossom some time. I can't recommend it as a honey-plant, but it looks nice.

D. S. BASSETT.

Farnumsville, Mass., Feb. 12, 1883.

Too much expense, friend B., and too much work to put up and take down. — We have had some nice plants, but, like yours, never seem to blossom.

## Notes and Queries.

## CHAFF HIVES.

**M**Y bees are all looking rather dirty in the single-wall hives, but look very well in chaff hives. I commenced last spring with 17 swarms, and increased to 33, and sold \$100 worth of honey, built in those sections you sent me. If my bees do not all die I shall need some more like them.

Perrinsville, Mich., Feb. 13, 1883. WM. C. HERRI.

## ONE-FIFTH OF A MILLION LBS. OF HONEY.

My purchases since September, of extracted honey, were over 200,000 lbs. About half or more is sold now.

CHAS. F. MUTH.

Cincinnati, O., Dec. 29, 1882.

## FROM 7 TO 22, AND HALF A TON OF HONEY.

I began last spring with 7 colonies, and extracted about 900 lbs., and took about 100 lbs. of comb honey, and increased to 22. Last season was the best we have ever had in this part of Illinois. I use a chaff hive of my own make.

G. T. WILLIS.

Hoopeston, Ill., Feb. 13, 1883.

I commenced the season with 100 stands, all very weak; took 5000 lbs. extracted honey, and 2000 lbs. comb. Comb honey sold at 15½ to 18 cents; extracted sold at 10 cents up to date, but I have 1000 lbs. yet to sell. This is not a very good location, for there are about 600 colonies within 2 miles of me.

Shellsburg, Ia., Jan. 6, 1883. ROBT. QUINN.

## SWEET-CORN MEAL—A SUGGESTION.

Who has tried Mammoth sweet-corn meal for bees in the spring, to stimulate brooding? We had a small patch, and fed it to some young fowls; never had pullets lay so early, and so abundantly.

## BUCKWHEAT IN MISSOURI.

The last of July is the best time to sow buckwheat here in S. W. Missouri. It fruits better, and its poor honey is out of the way, being used for brooding and winter stores.

M. JERRY.

Purdy, Mo., Jan., 1883.

## \$18.00 A HIVE.

My last summer crop of box honey averaged me over \$18.00 per "skep," spring count.

Romulus, N. Y., Feb. 19, 1883. JOHN UPDYKE.

I started in the spring with 8; have 21 now — two went to the woods, and returned two late swarms. I took 1100 lbs., mostly comb honey, all from upper story.

J. B. TOWNSEND.

Bedford, Iowa, Jan. 23, 1883.

## SAWDUST — SNOW.

If bees winter well in a snowbank, why not if covered with sawdust?

E. PICKUP.

Limerick, Ill., Feb. 9, 1883.

[It will do, friend P., only it must be kept dry. Snow is usually dry, you know.]

I made in 1882, beginning with last week in August, and ending second week in Oct., 1882, on an average of 14 hives, \$210. I have 15 hives, and my bees average 40 lbs. to the hive; nearly all queens reared from an imported one.

J. C. BAKER.

Paragon, Ind., Jan. 31, 1883.

## FRIEND JARRETT'S TROUBLE.

What would a man have done with 100 colonies of bees here last spring, not knowing what a season we were going to have, the average natural swarming being 6 and 7 to the colony, spring count?

West Point, Ia., Jan. 17, 1883. J. E. JARRETT.

## FROM 3 TO 12, AND 312 LBS. OF HONEY.

My report for 1882. I began in the spring, 3 hives of bees; got 312 lbs. of extracted honey, 95 lbs. of comb in one-pound sections and four-pound boxes, and increased to 12 hives, all in good condition, and plenty of honey to keep them through winter.

Hustisford, Wis., Jan. 20, 1883. WILLIAM SEITZ.

One man who keeps bees told me when I told of the large business you did in rearing queens, that there was no such thing as a queen bee. He never saw one, and did not believe anybody did. I told him I hoped to show him one some day.

EVERETT W. BRIGGS.

Plympton, Mass., Feb. 5, 1883.

## PILING UP THE HIVES FOR SURPLUS.

We had 17 colonies in spring; kept them from increasing by tiering them up 3 and 4 stories high, and took off 500 lbs. white clover, and 700 lbs. choice goldenrod honey, "all extracted." Our 17 colonies are packed in chaff hives.

B. SALISBURY &amp; CO.

Battle Creek, Mich., Dec. 21, 1882.

## CARPETING THE FLOOR TO THE PEET CAGES.

The tin slides of the Peet cages may be made less objectionable by giving them a coat of Demar varnish for a sizing, and covering them with flock, the same as sign-writers use. Try it. It is nearest a carpet of any thing I know of.

ALEX. COLLINS.

Corning, Holt Co., Mo., Feb. 2, 1883.

## 2000 LBS. OF HONEY FROM 6 COLONIES OF BEES.

I received from 6 colonies, spring count, 2000 lbs. of honey. One stranger I hived made 400 lbs. My hives are from 4 to 8 stories, 12 by 12 in., and 9 high. When I want but one swarm I put the new-hived swarm on the old stand; that settles swarming. My bees worked hard.

S. HAMMERSCHNEIDER.

Homestead, Iowa, Jan. 27, 1883.

[I should say they did work hard, friend H., and I am inclined to think you did a little of the same too. Eh?]

## NEW POLLEN.

My bees are all out to-day, and are gathering pollen. They are going in and out the same as they would in the month of July. Is it something strange for them to be out this season of the year? I went through them yesterday, and they are in excellent condition.

G. W. CREE.

Covington, Ky., Feb. 16, 1883.

The mercury is 66° above zero this morning, and I have just examined two colonies of bees. Both are in fine condition, one having brood in all stages. I can hardly miss the honey they have consumed. I have never lost a colony in wintering, and am in good hopes of getting all my bees through the remainder of this winter.

J. P. MOORE.

Morgan, Ky., Feb. 16, 1883.

## STATISTICS FOR NEW JERSEY.

After correspondence with Dr. Miller, I find that I can best carry out the auxiliary purposes of our association by requesting the fraternity in New Jersey to forward at once their reports, and those of their neighborhood, direct to Dr. C. C. Miller, Marengo, Illinois. Give facts on a postal. Do it now. For N. J. & E. B. K. A.

C. H. RUE,

Feb. 12, 1883.

Committee.

I began last spring with 80, and increased to 60 swarms, and 1000 lbs. of honey—600 comb, 400 extracted, and have had from 35 to 50 lbs. apiece to winter on. I got 15 to 17 cts. per lb. for comb, and 10 for extracted. This is nothing to brag of, but it is better than a good many have done in this neighborhood, for they have not got a pound of surplus with as many swarms as I have. Bees have wintered well here so far; my 60 colonies are all very strong, and promise well.

JULIUS FROSCHE.

Elmore, Ottawa Co., O., Feb. 17, 1883.

## WHEAT-STUBBLE HONEY, AGAIN.

On the 29th of July, between 4 and 5 in the afternoon, our bees were working on my nearest neighbor's wheat-stubble (where the wheat had been cut two days), so that he was afraid to go through to where he was going to rake, where it had been cut more recently, for the bees were not working there.

A GOOD WORD FOR THE GOOD CANDY.

Twelve swarms are now in the cellar, with plenty of stores, and in excellent condition; two weak ones we are feeding your Good candy, with the best results. It is ahead.

EDMUND L. YOUNGS.

Port Crane, N. Y., Jan. 4, 1883.

## Bee Botany,

## OR HONEY-PLANTS TO BE NAMED.

## SNOWDROP—SYMPHORICARPUS RACEMOSUS.

**T**NCLOSED find specimen flower-stem, and flower, of a shrub that is grown to some extent in this section, as a dooryard ornamental shrub. It grows from 4 to 6 feet high; the leaf and habit of growth very much resemble buck-bush, only of larger growth. The berries or fruit are white when ripe, and about the size and shape of cranberries. The name it goes by here is snowdrop. My attention has been directed to it for the last three weeks, as a honey-producing source. I think it equal, or nearly so, to basswood. Perhaps it will not yield

honey in as large quantities as the basswood; but as it remains in bloom so long, I am inclined to think that a larger amount of honey could be collected from an acre of this shrub than from an equal amount of basswood. It bears honey from early morn till late in the evening. The bees fairly fight over it. Can you give the specific or botanical name, and any information as to its value as a honey-shrub?

R. B. ROBBINS.

Bloomdale, O., June 26, 1882.

The plant is the *Symphoricarpus racemosus*, Mx., commonly called snowberry. It grows wild on rocky banks and is quite largely cultivated as an ornamental plant. The flowers are white, or slightly rose color, and are produced all summer. I have observed the bees working upon the bushes grown in this vicinity. There is another species, *S. vulgaris*, which has small dark-red berries. This latter is frequently called coralberry, or Indian currant.

W. R. LAZENBY.

Ohio State University, Columbus, July 10, 1882.

## Humbugs &amp; Swindles

## Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

**I**T is bad enough to be told there is a patent on using hives two story, or on using any kind of a division-board; but now our old friend H. H. Flick just wakes up to the fact that he has a patent on all wide frames for holding sections, and has had all along. Here is one of the circulars, such as he is sending out, to scare innocent unsuspecting bee-keepers into buying supplies of him, or "speedy satisfaction" will be demanded.

## NOTICE TO

## BEE-KEEPERS AND SUPPLY DEALERS.

Bee-keepers are respectfully informed, that I am the *Inventor* and *Patentee* of the double or broad frame for holding inside frames or sections, together with the section, for surplus honey; and that nearly all Apiary supply manufacturers and dealers are infringing on my patent, dated September 21, 1869, and ante-dated September 8, 1869, No. 95,100, which fully covers both frames in question.

Bee-keepers are advised not to use, or buy from manufacturers or dealers in Apiarian supplies, who are not licensed by me under said patent, as all persons infringing on said patent are liable for damages.

The law will be enforced in all cases of infringement, unless speedy satisfaction is given.

LAVANSVILLE, PA. }

Somerset Co. }

H. H. FLICK.

Many of our older readers will recognize the man as the one who took a recipe for artificial honey out of Dr. Chase's Recipe Book, and then, by means of a great spread-eagle advertisement, sold it for three dollars or such a matter. Mr. H. H. F., if you want us to keep your name standing right along in Humbugs and Swindles, just keep sending out those little circulars. As there is no date on the little paper, we might think it was a thing of a long time ago; but complaints and inquiries are coming from different directions.

## Our Homes.

Ye are my witnesses.—ISAIAH 43: 10.

SOME years ago our kind pastor, Mr. Reed, of whom I have before told you something, was conducting a series of meetings among us; and during their progress he made a remark something like this: That if the Christian people, or if even the members of our own church, would turn out to our regular evening meetings, the ungodly, and those who are open scoffers, the intemperate, and the deliberately wicked would come too. He furthermore said, that if the church people, when they got there, would stand up and testify, or bear witness to Christ's saving power, a revival would follow, and sinners would be converted.

Before going further, I wish to stop a minute. What is a revival? and what is "converted," as we Christian people understand it? Dear friends, I can remember very well the few short years ago when I used to stick up my nose, as it were, and say, "Oh pshaw! it fairly makes me sick to hear people talk such foolishness." I wonder if there are any who feel any like it now. If so, it is to them I want to talk. Intelligent people mean nowadays by "conversion," being revived up, and shaken up, to new and better impulses. If there are in your neighborhood people who are not square in deal, and you know it, you know that a revival of good impulses and purposes is needed. If you have people who are selfish, and who say one thing one day and another thing another because the latter happens to suit their purpose better, you know again that something to make people feel that it is before God they stand and act and think, would be a grand good thing, and so on through all the whole category of sins. Did you ever feel the need of some friend whom you could be sure was always right—never evasive or querulous, or known to give as an excuse for the evasion of duty, any thing that was not just the plain square simple truth? If so, did you ever find one? and do you know what it is to thank God for having sent you a friend who is always, and under all circumstances and provocations, thoroughly honest before himself and God? If you can appreciate such a virtue, have you yourself got it? If you are honest enough with yourself to own up you haven't, you can probably understand the need of a revival in your own heart. "Create in me a clean heart, O God, and renew a right spirit within me." Well, if the people about you need a revival, and you need one too, there is no further need of discussing the matter. Our pastor told us it would come, if the church people would only come forward and act up to their convictions. A friend thought he was a little rash in saying a revival would *surely* come, for how should he know positively?

There are, or, perhaps, I should say there were then, say 250 enrolled members of our church. It doesn't seem as if it would be a very difficult matter to get them all to come to these extra meetings, or, at least, practi-

cally *all*, for just a few evenings; and then, in view of the great good that was to be accomplished by getting rid of a lot of the sin of the world, or, if you choose, a lot of the ugliness in the world, it doesn't seem as if it would be very hard to get them all to stand up, one at a time, and testify to the fact that they knew of, and had had some experience, of the troubles made by sin, in order that we might unite our voices, and may be also our hearts, against this common enemy and foe to the happiness of mankind. Well, why should they not all come, in response to the invitation and express request of the pastor? Perhaps you would like to know how many did come. I can not remember now, but I think not more than 30 or 40. When individuals were talked to about the matter, they all insisted it was not their particular selves who were wanted. "Why, Mr. Root, do you really think it *could* do any good if I should go?" And thus it was that they made excuses, and refused to believe that any particular good could come from such a little simple thing as going to meeting, and standing up among the rest, and saying they were anxious for a deeper work of grace in our community.

One excuse for declining to "bear witness," as it is commonly termed, was because everybody knew already that they would do any thing for a revival in our town, and for the upbuilding of purity of morals, and uprightness of heart.

Have you noticed that I have had quite a fondness for telling what "*they*" did, or *they* said, all along? One would naturally infer that I went right along and stood up and bore witness, and did every thing that ought to be done, all right.

It is true, I did attend most of the meetings, and I usually took part, in some way; but I am sorry to say that I did it more because I loved my pastor, and wanted to assist him in any way I could, rather than because I had much real abiding faith that a general reform in our town would result from such a comparatively simple thing as having all the church come forward and bear witness. He explained to us, in the many kind sermons preached during those days, that it is not only those who live perfect lives, whom God wants to bear testimony, but especially the ones who feel discouraged because they make such poor headway in trying to lead Christian lives. "Just as I am, without one plea, but that thy blood was shed for me." It seemed almost in vain that he pleaded. The church wouldn't come, because they didn't *believe* any such simple act on their part was going to bring any great general good. I am sorry to say, that, although I came, I didn't believe very much that going to meeting and confessing myself a failure, in one sense, in what I knew I ought to be, would have any effect in stopping the blasphemy that emanated nightly from the saloon I passed on the way.

I had read where David said, after asking God to give him a clean heart and a right spirit,

Then will I teach transgressors thy ways; and sinners shall be converted unto thee.—Ps. 51: 13.

But I did not believe it, or at least I did

not realize that it applied to me as well as to David. The meetings for the winter were closed, and our disheartened pastor not very long after bid us a sad adieu, and accepted an offer to labor in a new field. Although a few during that winter started in the service of the Master, I presume many thought "the attempt to get up a revival," as they expressed it, was a failure. Was it a failure?

My mind goes back especially to one of the meetings that winter. There were but a few there, and mostly young people, or those but a few years on the Christian pathway. Our pastor again spoke of the importance of all taking a part, and remarked, with great emphasis and feeling, that if every one present, in just this little meeting, would stand up, or take part in prayer, a blessing would surely follow. For once it seemed his little flock were ready to stand by him; and although my faith was weak, and my thoughts probably much on business as usual, as one after another began to tell of their trials and successes in the straight and narrow path, I began to shake off my half-heartedness, and to enter fully into the spirit. Among the rest who spoke was a convert from our county jail, of whom I have told you. What he said was in substance something like this:—

"My friends, I can't stand it to sit still any longer. I must speak. I am not making the progress in Christian life I should make. I am very much of the time sadly discouraged, and almost ready to give up; but for all that, I love to be among Christian people, and I want to follow the Savior. I need your prayers; friends, remember me."

Do you wonder that these few words roused us up? It was as if some one who was out that winter night in cold waters, amid blocks of ice, had sent a pleading cry to us. Would we pray for him? The thought in many a heart was, "Why, God bless you, dear old friend, to be sure, we will pray for you, and help you by every means in our power." It had been whispered, that his religion had of late grown somewhat cold; but did any one there feel less inclined to pray for him on that account? Was there one there, think you, whose religion had not at some time grown cold? If I remember, every one gave witness in some way of the need of a Savior; and when the meeting closed we were "with one accord," like the disciples on the day of Pentecost, shaking hands, and showing in our looks that we felt a sincere kindness and good will toward each other we had not felt before. If any present had before felt a disposition to dwell on the infirmities of some other brother or sister present, the disposition was gone; and for the time, at least, he felt ashamed of it. I am pretty sure that every one present at that meeting made a marked step in the way of a better life, from that time forward. There were present, at the time, a young married couple who united with our church at about the same time I did. These two, although faithful in the performance of all church duties, and regular attendants at most of our meetings, had never taken any very active part in Christ's work, nor had they seemed as full of the Spirit as some who had more

heart in the work. At about the time of these meetings, or perhaps at this very meeting, these two friends seemed to wake up, and put on a new spirit of earnest devotion to the Master's work that was almost like the experience of a new convert. I noted the bright earnestness and joy in their faces, and, in my want of faith, wondered if it would last. It has lasted, dear friends, although years have passed since then. They have had some trouble, and been at times discouraged; but they have never, I am sure, been back where they were before those meetings. It has been my privilege once to cheer them in a time of trouble, and to hold up God's promises before them; but it was a far easier task than it is with those who have never known Christ's great love for sinners. Not only were these friends bright, and full of faith in our meetings, and in our Sabbath-school, but it goes through all their lives. "Ye are my witnesses;" and no one who has known them can well help seeing that their every-day lives are indeed a witness for the Master.

Those who attended that meeting, or the meetings of that winter, have been a sort of little band of earnest Christians of themselves, ever since. Every Thursday evening, and every Sunday evening, you will find them promptly on hand at the young people's prayer-meeting, and that, too, almost in spite of cold and storms. Not only have they been in attendance, but their voices, as well as their lives, have continually borne witness. The result has been, that the attendance has increased year after year, until we now have, instead of the dozen that used to come, an attendance of from fifty to a hundred. It seems a little strange to me now, to think of young people being attracted to a prayer-meeting; but it is nevertheless so, that our boys and girls, of almost all classes, now as a rule gather there regularly. They go, because the educated and intelligent young people of our town are sure to be there, and the meeting is mostly kept up and carried on by those of their own age who testify and bear witness to the cause of Christ. The time was when one who joined the Church would meet with sarcasm and ridicule among our people; but the influence and testimony are now so strongly on the other side, that he who gets up in these meetings and declares his intention and purpose to give up vain pleasures, and live for God and his fellow-men, meets with kind words and encouragement instead.

Through winter and summer these meetings were attended with zeal and interest; and although there were perhaps seasons of comparative dullness for a time, it was pretty sure to be followed by a stepping upward again pretty soon; and while I would by no means speak disparagingly of the weekly prayer-meeting for elderly people, it was manifest to any observer, that among our younger ones there was a brighter and more practical faith, if that is the word for it. I am now among the elderly ones, you see, and I have often felt rebuked for the want of zeal and interest I felt, as I came into their midst.

Well, shortly after the week of prayer, but

a few weeks ago, our pastor, feeling that the interest warranted it, called for special meetings to be held. Many came out; a few arose, and I felt that the work was doing at least tolerably well.

One evening after the meeting I said as much to him; but to my surprise he seemed in trouble. Pretty soon it came out.

"Brother Root, I am very much discouraged; yes, terribly discouraged. I am discouraged because of the indifference of our church. It is now a critical time with us; our town is full of a healthy interest on the subject of religion. Business men have called to see me and talk it over, and I am frequently accosted on the street, relative to the matter. Our young people are discussing and deciding, and great numbers are ready for the question, What shall I do to be saved? Through it all it seems as if the most indifferent class of people were the members of our church."

I suggested that we had a large attendance each Sabbath.

"Yes," said he, "they come to hear my sermons; and although I tell them what we want with all the power I possess, they nearly all seem to think it doesn't mean *them*; and at this critical time, when we want all the influence that can possibly be brought to bear, both in attendance and taking part, they stay away."

My good earnest friend had roused me up some by his little sermon (which I may not have given just as he told it), and I not only went myself, but gave all of the shop hands a pretty earnest invitation at the noon service. After the short sermon I was almost a little startled on seeing a young man arise and acknowledge the wrong position in which he stood, and ask prayers. He had formerly worked for me, and I knew him well. I wanted to get near him, and tell him how we all rejoiced, but he was gone before I saw him. On my way home in the darkness I heard two talking earnestly. It was before the residence of our old friend "M.," who is now assistant editor of one of our county papers. The new convert was bearing witness already, with earnestness and power. One remark he made was this, in substance:—

"Friends, I have not been right, and I knew I was not right. I have been dissatisfied all along, for I knew my influence was on the wrong side. I have made up my mind to-night, that this thing shall be no longer, and I feel happy over it already."

There was no need for him to say he felt happy, for it was evident in every word of the earnest tones in which he spoke. My friend, are you sure your influence is not on the wrong side? Is your life bearing witness on just the side you know it ought to be? You can not urge that you don't take sides at all. A silent witness is a witness against the cause that is up prominently before the people. Ye are my witnesses. As he finished, M. spoke:—

"I tell you, friends, I have not been what I ought to be. I am full of business, as you know, and I have excused myself from attending the meetings on this account. But just let me give you an illustration: A few

weeks ago the factory hands had a sleigh-ride, and asked me to go. I had more letters to answer that night than usual; but my wife and I both went to the sleigh-ride, and we got home so late that I got up at four o'clock in the morning and went up to the office and finished my writing. Have I ever done that for the sake of going to meeting? No; but I tell you, friends, I am going to do better."

He did do better, for he came to meeting and got up and confessed his past half-heartedness, and asked the prayers of the rest of the young people. As he sat down I breathed a "thank God," and felt in my heart that here was surely good solid work being done for our town people, and for the Master.

After the young convert left us that evening he went home to his boarding-place and told the people there of his new resolve; and when one of our factory boys came in shortly after, he told him also, evidently feeling happy at every step in the work of bearing witness. It came with the greater power from him, from the fact that he is usually of a quiet and reserved disposition; for everybody knows, who hears him speak, that it is "out of the abundance of the heart that the mouth speaketh."

The spirit of these meetings has gone all over and through our town. It has reached us here in the factory, and has lightened my cares in a way that none but God, to whom I have gone so often pleading, can know. There has been no excitement, and nothing in the least approaching what might be termed loud talk, even; for the greater part of our young people are educated and intelligent, and their testimony is given in words only loud enough to be heard distinctly. While their faces are for the most bright and cheerful, they seem to be so fully aware of the solemnity of such meetings, that we have the most perfect order. When one rises who is just seeking a better life, an almost breathless stillness pervades the room, that we may catch even the faintest word he utters. Something like forty or fifty have come forward within the past few weeks, and more than half that number have applied for admission to the Church. This is not all. Our old members have been revived, and made bright and hopeful, and voices have been heard in prayer around the family altar that for years have been silent. Hard feelings and unpleasantnesses have melted away like frost before the morning sun, and a neighborly disposition to help each other has come into many a heart, and a broader generosity has taken the place of narrow and selfish feelings. I make this last observation mainly from personal experience. My faith is brighter, both in God and my fellow-men. Reader, are you, and is your influence to-day on the *right* side? and if so, are you seeking first the kingdom of God and his righteousness with all your might, soul, strength, and mind? Remember, the Master said, "Ye are my witnesses."

Whoever therefore shall be ashamed of me and of my words, in this adulterous and sinful generation, of him also shall the Son of Man be ashamed, when he cometh in the glory of his Father with the holy angels.—MARK 8:38.

## Tobacco Column.

**I** JUST laughed until I cried, over your experience on the cars, going to the convention. Now look here, old friend "honest Indian," had you not been taking some simple kind of beverage with a brother bee-keeper? Perhaps it was taken through an honest-looking "straw," and "just a drop" to keep out the cold, eh? I have heard the argument of using tobacco, until I am at times tempted to try again to quit using it. But, oh, what's a fellow to do at night while musing over his expected tons of honey, unless he smokes tobacco? I can say this much for tobacco: It has, many and many a time, kept me out of other "devilments," and I for one say, "Remove the tariff; Messrs. Commissioners, give us *cheap* tobacco and high whisky." Besides, dear friend, remember I am a "tar heel;" and when you take the pipe and tobacco from us, "we'uns" are going to make trouble; and don't fall to remember this.

R. C. TAYLOR.

Wilmington, N. C., Jan. 19, 1883.

Friend T., we are not going to *try* to take the pipe and tobacco away from you. If you give it up at all, it must be, not by might, not by power, but by the spirit of Jesus our master, and then there won't be any trouble. In regard to your small plea for tobacco, I fear it is not always the best thing to do, to "muse over expected tons of honey." Tobacco may, for the time being, have kept you from doing something worse; but are we to give a big strong man like you something to do, with the simple idea of keeping him out of mischief? Why, friend T., you should be saving souls, instead of musing and smoking, should you not?

THE TOBACCO COLUMN; WHAT ONE OF OUR NEW FRIENDS THINKS OF IT.

I am much amused with your Tobacco Column. You must be a remarkable man to take so much interest in the tobacco-slaves (I am sure there are none like you in this section of country) as to give a smoker as an inducement to quit. Now, don't think that I want you to give me one, yet I *have* quit the use of tobacco. I will tell you about it. I don't take any pride in saying that I was an inveterate tobacco smoker and chewer, but I am glad that I have had nerve enough to quit. Well, as nearly as I can recollect I commenced when I was only about 9 years old, and used it about 36 years. There were few who used more than I did. After using it all day I would often get up in the night to smoke. Well, on the 22d of March, 1879, I *quit*; have not touched, tasted, nor handled the dirty stuff *since*. Well, do you think it was easily done? Not much. It was a hard battle; it was advance and retreat for many weeks; but I fought it out, and conquered. I think the trouble with many is, they will quit four or five weeks, just long enough to get into the thickest of the fight, and then surrender; when, if they would hold out a little longer, they would conquer. I think that a man who stops using tobacco should, as much as possible, keep away from people who use it, for a while, and not tempt the appetite. When I stopped I kept away from public places all I could until I began to get weaned from it. Now I am free from tobacco as well as whisky.

J. MCKEON.

Dryden, Tompkins Co., N. Y., Dec. 18, 1882.

By the way, friend M., it seems to me you make a pretty good point where you speak about keeping away from public places. A part of the Lord's prayer is, "Keep me from temptation." When you were keeping away from public places, were you not getting better acquainted with your family, and fulfilling your mission better, as a Christian and a father? I am glad to hear you tell of your experience; for such encouraging words are contagious, and I shouldn't be a bit surprised to hear that some other brother had just "gone and broke off," simply from hearing you tell of it.

And now, friend Root, a word for the Tobacco Column. I have used the weed about fifteen years, and now I am ready for the smoker. It is rather humiliating to have any one hire me, and to do what I know to be right; but I feel that, if I made an agreement with you, or any one else, I have honor enough to stand by it. I know it will be a hard job to break off, but I believe my word of honor is stronger than my appetite for tobacco; if, however, I can not quit, I promise to pay you the price of two smokers.

H. H. PEASE.

Kingsville, O., Feb. 17, 1883.

One word about tobacco. I don't use the weed; but had I not seen your Tobacco Column I think I should have tried it, for Mr. Quinby recommends it strongly; but after reading what I have in GLEANINGS I should feel ashamed to take up the habit for that purpose, when 75 cts. buys a good smoker.

Plympton, Mass., Feb. 5, 1883. E. W. BRIGGS.

HONEST AND CONSCIENTIOUS, BUT "COULDN'T HOLD THE FORT."

Inclosed please find \$2.75. Please send me GLEANINGS one year. The rest, \$1.75, will pay for smoker on Tobacco Pledge.

F. W. SMITH.

Parksville, N. Y., Dec. 27, 1882.

## "Remindery,"

Or Department for duties to be attended to this month.

**D**ON'T have any robbing in or about your apiary. Robbing is a disgrace to the community, whether among bees or men. You ought to be ashamed of it. You ought to be ashamed of yourself, if you have neighbors who rob, or neighbors' bees that rob. Set a better example, and take temptation out of the way. See that the neighbors, the neighbors' children, and the neighbors' bees are busily employed about something honest or useful. You are your brother's keeper, to a certain extent. Don't let your bees lack stores. Mrs. Axtell thinks they build up better where they can see that they have a great lot of stores ahead. I shouldn't wonder if she were right. Where you haven't extra combs of sealed stores provided for spring encouragement, give them Good candy over the cluster. Our girls knead it as they would dough, and it can be made into nice little round biscuits, to be placed right over the bees. You might work in some flour, if they are short of pollen; but where there is plenty of pollen in

the combs, I don't believe it will be of any advantage. *Too much* brood started very early is sometimes a detriment.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

MEDINA, MAR. 1, 1883.

But if the wicked will turn from all his sins that he hath committed, and keep all my statutes, and do that which is lawful and right, he shall surely live, he shall not die.—EZEKIEL 18:21.

THE drawing of friend Walker's case for comb honey came too late for place in this number.

THE last time our bees flew we had lost about 25 out of 185.

WHEN you write in regard to something that has previously appeared in GLEANINGS, please give page and volume.

ALTHOUGH we are turning out two fdn. mills now almost every day, we are still about 20 mills behind on our orders.

FRIEND J. H. Martin sends a bee's tongue register, considerably improved and simplified, compared with what it was a year ago.

WE have now on our 35-cent counter a very pretty little oil-stone, set in a mahogany box. If wanted by mail, 5 cents extra. Price of ten, \$3.00; 100, \$28.00.

WHEN we send you an estimate on goods, always return this estimate when you order, or at least mention that we gave you an estimate. If you neglect to do this, I can not be responsible for the errors that may accrue in consequence.

WE have received two numbers of the *New-England Apiarian*, and it surely promises well. The work is neatly done, and the articles seem to be well chosen. It is published by W. W. Merrill, Mechanic Falls, Maine. Success to you, brother Merrill.

WE want catnip seed, horsemint seed, spider-plant seed, figwort seed, white Dutch and alsike clover, and, with the present demand, we are likely to need about every kind of bee-plant seed known. Have you got any? and what do you want for it? Send sample, and give price.

WE have just had a call from our friend M. D. York, Millington, Mich. Among other things, friend Y. said he wanted to thank me for having, through the influence of the Tobacco Column, got him to give up tobacco. He doesn't look as if he had suffered any harm by the break-off.

ALL the time some of the friends are wanting to buy the rolls only to our fdn. mills, saying they can make the frame themselves, and thus save money. You can't do it, friends; the rolls are the expensive feature of the machines, and you could not begin to make the frame at the price we do.

WE are just about out of *real nice* clover honey. We have quite a quantity of beautiful clover honey, light and thick, but it doesn't sell, because it is tainted a little with goldenrod, or some other fall flowers. If you want your honey to bring the best price, don't let a particle of fall honey get mixed in with it.

AFTER we had got a nice trade started on bell jack-screws, the manufactory broke down, and we had to send to another place and get a higher-priced one. By buying a whole gross we were enabled to get them so they are only 25 cts. more; but do you not see, dear friends, how absolutely impossible it is for us to entirely avoid changing prices?

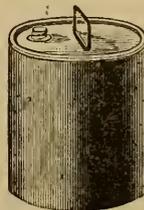

MUCH matter is crowded out, and to-day "Barney" says there isn't "a spec of room" left for Doolittle's article, and another from one of his neighbors. If you don't stop giving us so many ads., and such a subscription list, I don't know but that we shall have to enlarge the JUVENILE again, and give the old folks a corner of it.

WE have bought all the wax that has been offered, and have paid for a nice article as high as 35 cents cash, and now I know of no more for sale anywhere at any price. In view of this we shall advance the price of fdn. 5 cents per lb. on all orders that reach us after the 15th of March. I really hope there is wax that will be thrown on the market at this price, and that further advances will be unnecessary.

IN trying a new fdn. mill, have the rolls warm enough so they do not feel cold to your hand. Have the sheets of wax at such a temperature that they will neither break nor be too soft. When they are leathery is about right. Do not use a large piece of wax at first trial; for if it sticks to the roll, you will not have so bad a job to get it off. Do not let any wax get into the rolls unless the rolls and wax too are well lubricated with starch. When you get every thing just right, the wax should almost run out of itself.

### SOME MORE TINWARE.

WE thought we had got already every sort of package one could possibly ask for; but I found the makers of maple-sugar implements had such a neat molasses can, I felt we must have it for honey. You see, any sort of pail, unless the lid is soldered down, or closed with cement, is unfit for shipping honey, unless it is candied very hard and solid indeed. With this the package is safe from leakage. But another point comes in: Maple molasses, as well as honey, is a little tempting to the boys who handle such freight; and, to make matters safe, we always solder a little slip of tin across the cap, and then catch it on the pail. If it is meddled with on the way, it is plainly evident, when the consignee receives his goods.

OUR 15-CENT GALLON  
HONEY-PAIL.

### SELLING RECIPES, ETC.

SELLING information is, I believe, generally conceded to be an honorable business, providing you give, in return for the money you receive, "value received," or, in other words, if you receive a dollar, or five dollars, you are expected to give a treatise, or book on the subject, such as usually sells for about a dollar, or five dollars as the case

may be. But charging a dollar, or several dollars, for information that can be written or printed on a little bit of paper, or even in a small pamphlet, is not only behind the times, but hardly in accordance with the spirit of our modern institutions. We not only can not accept advertisements for any thing in this line, but I should not want to do any advertising for a man in that kind of business, lest he might send our customers circulars, urging them into such investments. I think it will be safe to class all such offers as little better than swindles; and if innocent persons have got into any such business, they will have to suffer for being found in bad company.

We have already 5000 subscribers and 46 over, and it is only March first. Don't you think that is doing pretty well?

The bees are flying to-day (March 1st), and we find so many weak we should like to dispose of about a dozen queens, as follows: Three hybrids at a dollar each; eight or ten tested queens, at \$2.00 each. Safe arrival guaranteed. Selected and imported queens at catalogue prices.

We can not, at present, agree to take queens of anybody. The demand and supply is so uncertain, and the property so perishable, that the best I can do is to tell you when we are in need of them. Work up your local trade near home, and it will be much better for all of us than sending the poor little pets thousands of miles through the mails.

FRIEND PELHAM, of Maysville, Ky., has developed our old idea of making fdn. by means of dies cast of type metal, and offers a 10-inch mill for only \$15.00. The fdn., however, has an unnatural base; but this, he thinks, will not hurt it. It seems to me it must take the bees longer to work the cells into shape; but a practical test in the hives may show he is right. His samples are very handsome to look at.

#### DIPPING SHEETS FOR FDN.

MAKE your dipping-boards of thin maple, about 30 inches long, and have your dipping-boiler about two feet deep. Use boards without any handle; and after you dip once, turn it end for end, and you will have sheets of about uniform thickness their whole length; and after they are rolled, one sheet will make two sheets of fdn., to fill wired L. frames. It saves labor in dipping and labor in rolling, and we can now furnish you fdn. of an even thickness, 35 inches long, if you want them so. We have found that dipping-boards of seasoned hard-maple stand the water better than either whitewood or basswood.

#### MACHINERY FOR FRAME-MAKING.

SEVERAL have inquired how we make the notches in the top-bars for all-wood frames, and for the top-bars to wide frames. We long ago discarded cutter-heads for this purpose, because they dulled so quickly, and we now do it by means of saws clamped closely together on the mandrel. We use as many ordinary grooving saws as are needed to get nearly the required width of the groove, or channel, and then put a thin cut-off saw on each outside. The cut-off saws cut off the wood square and smooth, and the groovers then rake out the wood. For grooving lengthwise with the grain, the cut-off saws are not needed. The expense of sharpening saws is but little more in the end than for cutter-heads; and having so many more teeth, they do a far larger amount of work without re-sharpening. For the groove in the all-wood top-bar we use only one groover, with a cut-off saw each side of it.

## FRIEND SHUCK, AND HOW HE DID IT.

SEE P. 86, FEB. NO.

**Y**OU say, "We should like to know all about how you do it, if you will be so kind." Certainly; but it would make quite a lengthy letter, to give all the details, so I will tell *how* it was done, and leave out the details.

I had about 200 extra combs, and used 25 lbs. of fdn. I use the Simplicity form of hive, and worked my bees for all the honey I could get, increasing only to prevent natural swarming. This, with the working qualities of our bees, and the favorable season, is the key to our "good luck." Striving to prevent natural swarming hindered our obtaining a "big" yield from any one stock. The largest amount of extracted honey from one stock was 228 lbs. The most from one stock, in comb, was 157 lbs., and 32 lbs. extracted. One stock, occupying only 4 L. frames June 1st, with a 3-year-old queen, superseded their queen July 10. I sold the young queen and 1¼ lbs. of bees from it July 20, and gave them a laying queen next day, and obtained 136 lbs. extracted and 23¼ lbs. comb honey.

Another stock occupying only 3 combs gave bees and brood for 2 new stocks; was without a laying queen from Aug. 2 to Aug. 29, and gave 101 lbs. extracted and 23¼ lbs. comb honey. A stock occupying only 4 combs, without any increase gave 133¼ lbs. extracted and 4½ lbs. comb. The poorest of the 30 original stocks was a one-frame nucleus, and queenless June first. The queen hatched, June 7.

July 8 I gave them ½ frame of hatching brood. July 17 I took 4¼ lbs. extracted honey, and Sept. 26, from an upper story I obtained 29¼ lbs. extracted honey.

During the last week in May, most of these nucleus colonies were robbed of all their brood, except one comb each, for the purpose of strengthening full stocks, or those that were nearly full; and to my surprise, at the close of the season the nuclei were but very little behind in the amount of honey produced—those to which the brood had been given.

Bryant, Ill., Feb. 7, 1883.

S. A. SHUCK.

The above would seem to cast a doubt on the advisability of taking brood from one stock or nuclei, for building up others; but I supposed that, even if the stocks helped were not much benefited, the nuclei would certainly be weakened, and injured for honey-storing. Friend S. does not seem to have found this the case, however. Does it really pay, friends, this taking bees from one colony to another, and upsetting the regular order of things?

## BYRON WALKER'S IMPROVEMENT IN SECTIONS.

ALSO SOMETHING ABOUT GETTING READY BEFORE THE SEASON IS UPON US.

**T**HE letter of Byron Walker, containing my testimonial, with your comments on it, occasioned me some surprise. Had I known what use Mr. Walker intended to make of my testimonial, I am not sure that I would have given him permission to use it as I did. I supposed he wanted it for his own circular, instead of publishing it in GLEANINGS. It is true, that I like his sections the best of any that I have used, but it is too much to ask you to publish a letter recommending another man's

sections. I was somewhat astonished at first on reading that I had complained of Friend Walker's sections, as I did not remember having mentioned them. I recollect thinking that I would write to you about his improved groove, and I suppose I must have said something about his sections, though I do not now remember what it was, as it was probably written in a hurry during a very busy time.

I received the first of these sections about the middle of the summer, taking them in exchange for queens. For some time I did not like them, as I thought it took too much time to nail them. Many of the next lot of sections I received from you, however, had shrunk so that they had to be nailed. This was at the time when you were so crowded on sections; and when I came to take the sections off and crate them, I appreciated the extra stiffness that the nailing gave.

I think, however, the angular groove is the best feature of friend Walker's section; and if your sections were made of well-seasoned wood 5-32 thick, with this groove, they would be preferable to the nailed sections, unless they were to receive very rough handling. I have not abandoned your section yet, as I have already ordered of you 5000 half-pound sections, and will order more of the regular size next week.

While I am writing on sections, I want to advise everybody to be sure to have enough — yes, more than enough, of all necessary supplies before they are needed. I am quite certain that I lost at least \$500 last season by not having sections, frames, fdn., etc., when I needed them, and I know of other bee-keepers who lost even more, proportionately. I do not intend to be caught so again, you may depend on it.

Dayton, Ill., Feb. 13, 1883.

J. A. GREEN.

Friend G., I rather enjoy publishing letters that recommend other men's goods, when I really think they are better. It goes a little against the grain, it is true, but I always feel "good" after it. We are adopting the improvement, and will report after a little. I highly appreciate your concluding remarks, for I do feel sorry for those who want supplies and can't get them.

#### CONVENTION NOTICES.

The spring meeting of the N. J. and E. Bee-Keepers' Association will be held in New York, at Cooper Union, March 14, 1883. J. HASBROUCK, Sec.  
Bound Brook, N. J., Feb. 21, 1883.

The Eastern Michigan Bee-Keepers' Society will hold its annual meeting in Detroit, April 3, in Abstract Hall, commencing at 10 A. M. An interesting meeting is expected, and bee-keepers are invited to send items, or questions of interest, to the secretary in time that they may be announced previous to the meeting. All bee-keepers invited.  
Detroit, Mich. A. B. WEED, Sec.

The Central Michigan Bee-Keepers' Association holds its spring convention at Lansing, in the State Capitol Building on Tuesday, April 17, 1883, at 9 A. M. Programme: President's address, Prof. A. J. Cook; Wintering Bees. Essays: S. C. Perry; The Chaff Hive. C. Case; Comb Honey. O. S. Smith; The Best Bee. A. D. Benham; Extracted honey. M. Harper; Queen-Rearing. Mr. Waldo; Best Method of Wintering outdoors in Single-Wall Hives. E. N. Wood; Sections. E. Greenaway; Comb Foundation. All bee-keepers are invited to attend, or send essays, papers, implements, or any thing of interest to the fraternity. A full attendance is requested of all who are interested. E. N. WOOD, Sec.  
North Lansing, Mich., Feb. 13, 1883.

#### CIRCULARS, ETC., RECEIVED.

J. B. Mason, Mechanic Falls, Me., has sent us his price list of bees, queens, etc. It is neatly arranged and printed, 28 pages, 5½ x 3¼.

From Will A. Hammond, Richmond, Va., we have received a one-page list of bees and queens. In the middle is a large queen printed in yellow, looking decidedly life-like. If for no other reason than to see a specimen of printing which is a delight to the eye, send for this.

Merriam & Falconer, Jamestown, N. Y., have just mailed us their catalogue of 24 pages. It is profusely illustrated, and presents many points of interest. The printing is very good. One of the best features about it is an index.

J. Luther Bowers, Berryville, Va., sends us a nice 4-page list of bees, queens, etc.

Narmore & Wood, North Lansing, Mich., have sent us an 8-page price list of apian supplies. The printing is of a decidedly "amateur" cast.

E. B. Beebe, Oneida, N. Y., has sent us his 16-page price list of bees and apian supplies, nicely illustrated. It is well printed, and will pay perusal.

We have just printed for A. D. Benham, Mt. Olivet, Mich., a 4-page price list of bees and queens, and general supplies for the apiary.

Friend I. R. Good's postal-card circular was overlooked accidentally last month. It includes Italian and Holy-Land bees, foundation, etc.

Henry Drum, Adelphi, O., has sent us his fifth Annual Circular and Price List of apian supplies; 8 p., 4 x 8.

Jas. O. Facey, New Hamburg, Ont., Can., comes to the front with a neat 4-page price list of nearly every thing pertaining to modern apiculture.

MRS. LIZZIE COTTON'S CIRCULAR.

I am being asked my opinion of the new circulars Mrs. Cotton is again sending out quite plentifully. The statements she makes, and the prices she charges for the goods she sends out, would, in my opinion, forbid her being classed with our regular supply dealers, to say nothing of the strings of complaints against her that have filled our bee journals for years past.

# Stanley's Vandervort Foundation, PURE ITALIAN NUCLEI, AND ALL SUPPLIES NEEDED IN THE APIARY.

We are now prepared to furnish a large amount of our celebrated foundation, immediately on receipt of orders. This foundation is all made from choice yellow wax, and the workmanship is very fine, so that we feel sure that our goods will give perfect satisfaction. We are also agents for all kinds of Bee-Keeper's goods, and can furnish them as low as factory prices, and in some cases even lower. We sell the U. S. Standard Honey-Extractor at 10 per cent off the list price to all our customers who buy other goods of us. In addition to the above we have made arrangements so that we can furnish a large number of pure Italian Nuclei at greatly reduced rates. We will sell them with tested or untested queens, or without queens, as parties may wish. Those who wish to start an apiary the coming season should write and tell just what they want, and get our prices. Our nuclei will be built on full-sized L. frames, and will be well stocked with brood and bees. In fact, we shall make the nucleus trade a business, and will give you a good trade in that class of goods. Address

**G. W. STANLEY & BRO., WYOMING, N. Y.** 3td

**UNPARALLELED OFFER BEE-KEEPER'S EXCHANGE.** All those who wish to secure this "unparalleled offer" with a sample copy of BEE-KEEPER'S EXCHANGE, and our price list of Apian Supplies for 1883, should send their address, plainly written on a postal card, at once to

3td

(Successor to Houck & Peet.) **THEO. HOUCK, Canajoharie, N. Y.**

**FOR SALE! 33 COLONIES BEES; 40 CHAFF, 50 SIMPLICITY HIVES, COMPLETE; 45 LBS. DADANT'S FOUNDATION. Also EXTRACTOR, LAMP NURSERY, KNIFE, SMOKER, and all things necessary for producing Comb and Extracted Honey, and for Queen-Rearing.**

3d

**SQUIRES BROTHERS, GREAT BEND, Pa.**

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. 1.

MAR., 1883.

No. 12.

**MYSELF AND MY NEIGHBORS.**

If God be for us, who can be against us?—ROM. 8:31.

**M**Y little friends, I am now in the midst of a great "buzz." The lot of "neighbors" grouped around me is greater than it ever was before; or, at least, so it would seem; and one very pleasant feature of it is, that a great part of them are young Christians that have just started out on that journey you read about in the Pilgrim's Progress I have been sending you of late. I have a great many applications all the while for places, as you know; and, in fact, a great many more than I can possibly find places for. When the one who appeals has seemed very deserving, I have, as I have often told you, been in the habit of remembering them to God when I kneel down after the hands are all gone to their homes. Well, children, you can readily see that I can not very consistently, or very conscientiously, ask God to help me to find work for those who do not have faith in him, and who do not themselves go to him in prayer. Over and over again have these prayers been answered in such a queer way that I myself have been about as much astonished as any one.

Of course, you know I do not mean that uniting with the Church, or getting up and speaking in meeting, of itself, is going to help any one to get work, or to get any thing else they need badly; but when a girl or boy,

at the same time that he gets up in meeting, resolves to do right, and be faithful before God, he will most assuredly get a place to work, or get almost any thing else he wants, providing he has patience to work faithfully, and has religion enough to want only good and proper things.

A few evenings ago, a young couple came into the office. They were recently married, and both, within a few weeks, came out on the side of Christian people. I told them I could see no possible opening, but that we would have, each and all of us, to make it a subject of prayer. They seemed so ready and willing, with the trustful, happy atmosphere of the recent meetings so manifest in their faces, that it seemed to me that God would surely heed our request. After they went out I knelt, as usual; and while in prayer it all came into my mind where I should set them at work, so plainly that I ended my request with thanks and praise for the answer, which came almost before I had got through asking.

To tell you how it came I shall have to explain a little. Orders are coming very fast now indeed. The packers, and every one who can be trusted with putting up goods, are crowded. In spite of their best endeavors, we have letters for goods piling up on our tables, even while the goods are all finished and ready to be sent out, and nobody to put them in boxes and send them off. You doubtless think it is a very simple

thing to send off goods. I presume a great many of our boys and girls think if they had the goods all ready, and the money was paid for them, that they could put them in a box and mark the directions themselves. I tell you, my friends, it is no small matter to pick up a bill of goods in such an establishment as ours, and have every thing just what is wanted, and then have it go just right. It is true, the clerk can have a pencil, and mark or check every article as he puts it in the basket; but very often, people in their orders call things by different names, and in all sorts of funny ways indicate what they want. Besides, one who is not educated to the business will be almost sure to lay something down and forget it; and then when you get your box of stuff you will be vexed, and may be greatly inconvenienced by finding that the thing you wanted most isn't there. You may say it needs somebody old and experienced for such work. The experienced part may be all right; but I have not found that age makes any very great difference. Besides, if it did I can't very well afford to pay grown-up people, who can earn several dollars a day, for picking up five-cent bee-feeders and three-cent nest-eggs. Another trouble comes by having orders delayed. With such a heavy drain on our stock of goods, we are liable to run out before we know it. Some of you sent in orders that, among other things, called for alsike. When the order was received we had plenty; but by the time the shipping clerks got around to yours it was all gone. Thus you see I did you a positive wrong by our being behind.

Well, just as soon as this young friend applied, I thought of the goods to be sent out; but as he knew nothing of our goods at all, it was out of the question thinking of him for a packer. He had the strength, the good will; but who was there to be with him constantly and show him? Another point: Yesterday one of our large strong men had a heavy box of goods to put up; and with the other things was a dozen steel pens, some blanket-pins, a pocket-compass, and a lot of other little stuff that ought, by good rights, to be done up in tissue paper, and packed in a little box, something as a jeweler would do it. A good many things of this kind have been lost in the straw, because of a want of proper facilities, or, if you choose, the proper feminine fingers to do it neatly and quick. I took the goods I mentioned to Eliza, to get her to do them up; but she was hurried with lots of orders, besides customers from our own vicinity who wanted sap spiles and pails, little tins for sugar-cakes, and the like.

Now, I knew all the time while these young friends were talking, that the wife was familiar with our whole premises, for she had worked for me years before they were married. She said that she, too, would like to work for me again, if I could find a place for any more women. While on my knees the thought came into my mind that she could show him, pick up and wrap up all the light goods, and that they two would mutually help one another, so they could make it go nicely. You know I would hardly

want to ask a man and woman to work together in just that way, unless they were man and wife; and here God had sent the two to help to my very door; nay, further; inside the door, right to me, and I had sent them away. I sent for them both next morning, and they are putting up orders now. Very likely there will be some mistakes, for it can not very well be avoided with new hands; but, dear friends, will not a few mistakes be better than very much delay? And again, will it not be better to put up with some trifling errors, than to advance the price of goods, as I should have to do, if I employed expensive skilled help that would be absolutely without mistakes of any kind? They gather the goods up, place them on a table in a long row, just in the order you call for them; and when all are ready, I just step in and call them off as fast as I can read. To get room for them to work we have cleared a lot of goods out of the room where the great press runs, and Mr. Gray is now busy making them a neat little table, with shelves underneath, where Mary can keep her nice paper, twine, and little boxes for the small stuff; and as this room is not far from the counter store, they can easily step in there for goods, or for instructions from Eliza.

I feared some little objection to my plan before I got through, for you know old hands are often a little particular about having their work-rooms invaded. But here I was surprised a little to find a hearty acquiescence; and when Mr. Gray found out what I "was up to" this time, he too gave me a hearty word of approval. "If God be for us, who can be against us?" Don't you see?

There, now, children, I am going to stop right here, and give you the rest of the room; for I tell you there is a heap of little letters this month. Remember our little verse, "If God be for us, who can be against us?" And God is always for us when we are for him. How many of you want always to be "on the Lord's side"?

---

### VIRGIL'S TREATISE ON BEES.

CONTINUED.

**V**IRGIL suddenly "gets a bee in his bonnet" at this point of his treatise. The idea evidently strikes him, that we may all get to nodding if he keeps on giving huge chunks of wisdom about bees in a straightforward, prosy way; thereupon he brightens up, and lets off some of his poetical fireworks to set us awake. The delighted commentator in my book declares that nothing can be more lively or animated than Virgil's description of a bee-battle.

SPRING.

Now when the golden sun with royal might  
Doth ope the door of heaveu with summer light,  
And conquered Winter drives beneath the pole,  
As in their round the appointed seasons roll,  
Forthwith the bees do wander far and wide,  
Through open glade and waving sylvan side;  
They reap their harvest, flowers of purple hue,  
And lightly sip the waters of the dew.  
Joyous henceforth they cherish nests and brood,

I know not with what love nor with what food. (1)  
Fresh scales of wax they forge with cunning art,  
And make their honey firm in every part. (2)

SWARMING.

When now at length, emerging from their caves,  
To swim through summer's liquid, airy waves,  
You shall behold a swarm ascend the sky,  
Drawn by the wind as a dark cloud on high;  
Then mark them well, thou surely shalt admire,  
If nature's wonders feed thy soul's desire.

AUTOMATIC HIVING.

They always seek, to crown their festive hour,  
Sweet waters, and withal a leafy bower.  
Here strew the flavors that they deem superb —  
Bruised balm and honeysuckle's common herb.  
Rattle the tin, and clash the cymbals round, (3)  
And they'll to medicated spots come down.  
By their own laws, that ever guide their lives,  
Straightway they'll place themselves within the  
hives. (4)

BEES ON A RAMPAGE.

But if, indeed, to battle forth they go  
(For discord oft with overwhelming throes (5)  
Hath seized two kings), then straightway 'tis allowed  
To ken before the purpose of the crowd,  
And their fierce hearts all quivering for the war;  
For those delaying ones who strife abhor,  
A veritable martial song inspires, (6)  
Of rasping air, to kindle anger's fires,  
And voice is heard, a voice that swells and rolls  
Like trumpets' sound to strengthen feeble souls.  
Then rush they 'mong themselves, and flash their  
wings,

And move their pincers, and thrust out their stings;  
Thus practicing in drill they move aright,  
And strengthen all their members for the fight.  
Thou round the king and royal court they ball, (7)  
With clamor great for worthy foe they call.

Therefore when first they gain a bright spring day, (8)  
With open plains of air afar away,  
Like a volcano restless, surging o'er,  
Forth from the gites a living tide they pour.  
They charge; and in high air there swells a sound;  
Mingled, a great orb, they wheel around and round;  
Headlong they plunge; not thicker down the gale  
From the great oak the beaten acorns hail. (9)  
Down through the middle ranks the flying kings,  
Distinguished over all by royal wings;  
Great, noble souls in narrow breasts revolve,  
Determined not to yield, with stern resolve,  
Until the victor, in his conquering might,  
Compels or these or these to give their backs in  
flight. (10)

Such tumults of their minds, such strifes adjust  
By throwing o'er them handfuls of fine dust. (11)

Mercy on us! who's going to stand in the road and  
try it, when it rains such little "pizen pitchforks"  
as these? Let's "light out" as quick as we can.  
Let's try to think if there isn't a bee-keepers' con-  
vention somewhere that we can go to.

(1) No line we have yet come to shows so plainly  
the wisdom and modesty of the great author we are  
studying than this. To perceive how little we know,  
and how much that is of interest is yet to be found  
out, is a state of mind that fools do not attain to.  
Virgil was wise enough to raise two important ques-  
tions here, and confess his ignorance in regard to  
both of them; namely, Are bees capable of feelings  
of affection? and, What is the nature of the food  
given to their young? I suppose most of the thou-

sands of sophomores who have gone over this have  
said to themselves, "Humph! all creatures love  
their young; and the bees feed their young, honey,  
of course." Well, they don't feed them honey, at  
least not at first; and the precise nature of the food  
used is a problem that modern investigators are  
still digging away at, like dogs at a woodchuck-hole.

As to the first question, I guess we have pretty  
much come to the conclusion that bees have not a  
spark of affection about them. Whether feeding a  
starving comrade, or helping to murder a young  
queen in her cell, or nourishing the newly hatched  
larvæ, or turning cannibals and eating them up,  
they seem to be guided by a stern sense of destiny  
that has in it no more of tenderness than there is in  
the soul of a buzz-saw. Oh, they're curious crea-  
tures, these bees of ours!

While watching some bees I saw one of them at-  
tack one of his companions. I suppose he decided  
him to be an invalid that would be of no use in the  
colony. He was smart enough, however, to make a  
long struggle for his life; but at length he was over-  
powered and stung to death. I saw him curl up and  
die. I guess the rest of the bees didn't think he  
needed killing; at any rate none of them took hold  
to help, as they usually do when there is a muss.  
Well, the murderer briskly brushed himself and ran  
to a bystander, as much as to say, "I've done my  
duty, but 'twas dreadful hard work; can't you give  
a fellow a little honey?" And so his comrade dis-  
gorged some honey and fed him; and I felt very  
much disgusted with the whole business.

(2) This is the place, I believe, where the ridiculous  
charge is made against Virgil, that he taught that  
bees *make* their honey. You see, it looks differently  
through my spectacles—just the difference between  
making their "tenax" honey, and making their  
honey "tenax." If we did not know, as we as-  
suredly do, that Virgil was a careful and well-in-  
formed bee-man, we should still be bound to take  
his statements in a sense that would be tenable, and  
not absurd, until obliged to understand them other-  
wise.

(3) Well, if Virgil did tell us to kick up a rumpus  
when the bees swarm, it doesn't do any harm; and  
nobody has *proved* but that it may do a little good.

(4) You see, it is not merely keeping the bees from  
going off that our author is driving at, but making  
them go into the hive prepared for them just of  
their own selves. Such an undertaking succeeds  
once in a while — just often enough to keep bee-men  
experimenting at it. Some considerable improve-  
ments have been made since Virgil's time. One is,  
to have a number of decoy hives placed around in  
distant tree-tops. Another, is to put a decoy, made  
in imitation of a cluster of bees, on the top of a bal-  
anced pole, which swings down with the bees when  
they alight on it, and deposits them at the entrance  
of their future home.

(5) Here is a striking example of how a long series  
of actual facts, minutely given in detail, can be mis-  
apprehended. The performances spoken of in this  
paragraph are those that precede and accompany  
what is called "swarming-out." Virgil, seeing no  
other rational cause for these movements, attrib-  
utes them to the growth of a martial and belligerent  
spirit. The fact seems to be, that swarming-out is  
sometimes entirely irrational, ruinous as it is need-  
less, and arising from protracted idleness and dis-  
content. Usually, however, we may regard it as

nature's way of uniting unprosperous colonies. I long ago came to the conclusion, that the awful beerrampages we sometimes read of in the papers are usually brought on by getting clusters of swarmed-out bees stirred up and infuriated — although they had no particular ill will to anybody or any thing when they came out.

(6) If I am right, (this martial song, or trumpet-sound, is not really a martial song, but a death-song. When colonies are in a healthy state, the worn-out bees go away and die quietly; but in the spring, after a hard winter, this sound is often heard. It is made by a very few bees, often only one, standing in the entrance and whirring the wings with such a noise as to be heard several rods away. I am not sure, but I infer that the bee soon dies, and the sound ceases until another bee takes his place. When this noise is heard in many hives, then look out for some tall swarming-out when the weather gets fine.

(7) Everybody who has had much experience with spring dwindling ought to know how prone bees are at such times to ball their own queens.

(8) This waiting for a beautiful day and then coming out, reveals what the disturbance spoken of really is. After the terrible winter of two years ago, the first beautiful day happened to be Sunday; and I had eleven swarms cut up this caper and swarm out while I was gone to Sunday-school. So far as I could find out, however, none of them got to fighting.

(9) I did not bring out the idea in the translation, but am pretty well satisfied that the poet meant to allude to the method of gathering nuts and acorns by the use of a battering-ram. I wonder how many of the children have ever seen nuts gathered in that way. To tell the truth, I never did myself, but I have heard tell about it. A big log is piled up and hung by the middle. It is then set in motion, and sent against the trunk of the tree with such an awful "bunt" as to make the old tree quiver from bottom to top; and the nuts let go and come down — like a swarm of bees.

(10) Here is a delicate touch of Virgil's art, delightful to critics — using exactly the same word the second time, instead of changing from *these* to *those*, as we usually do. "Wallace" will have to look sharp to those printer-boys, or they will "correct" it, and make it *or these* or *those*, in spite of every thing. This curious form of expression helps to give the passage that air of impetuous rapidity which makes it a sort of poetic avalanche.

(11) Dust has some advantages over smoke. It requires time to get a smoke ready to use; but dust can often be had instantly. Smoke can be thrown but a little way, while dust can be hurled quite a distance. Who knows but that a deluge of dust would subdue the Cyprians that pay no attention to smoke at all? At any rate, when a square rod or more of ground is covered with bees, fighting and tumbling about in mortal combat, a bushel or two of dust promptly hurled over them may be the only thing that will stop the fighting. E. E. HASTY.

Richards, O., March 5, 1883.

I believe I shall have to agree with you, friend Hasty, that, if bees do have any love for each other, it is a queer kind of love — after a sort of cool, mathematical sort, that calculates the greatest good for the greatest number, without any thing of an emotional nature about it. They rejoice in numbers,

simply because in numbers there is strength; and your "buzz-saw" illustration, I opine, is pretty near the truth. I heartily indorse your No. 1, friend H. It is a mark of a great mind to say one doesn't know; at least, once in a while.

#### A LITTLE LETTER FROM OUR OLD FRIEND "BESS."

PRICE OF HONEY IN WASHINGTON, ETC.

ENCLOSE you an article clipped from a paper. [See p. 66, Feb. No.] The statement of this hibernating personage sounds so delightfully sanguine that he surely must be closely related to the owner and author of "Blessed Bees." I should think, if wintering in the South is so profitable, that there would be more successful reports from Southern bee-keepers, and that honey would be at least cheaper in this section of the country; but we paid Saturday evening, in market, 30 cts. per lb. for honey in sections, and "chunk" honey retails at 25 cts., and not very nice at that. I have never laid eyes on extracted honey since I have been here, and my husband says that he never ate any in his life.

A FIVE-CENT STORE ON A BOOM.

If some enterprising Yankee would go into the business, I rather think he would be as successful as a merchant on 7th St., who opened a five-cent store during the holidays, and then had to hire a stout darkey to hold the door, admitting the crowd from the outside only as fast as the store emptied so as to permit it. He had to do this in order to keep his customers from being actually crushed to death.

I see by Jan. GLEANINGS that you are still devising ways and means for keeping a list of "squake" men. Would it not be better to simply report those — with proper proofs — who have not the required four "right angles" of honesty, also *Cotton-y* women, to the Postmaster-General, and let him place them on the "fraud" list? He can most effectually stop their impositions on unsuspecting mankind, by simply directing postmasters not to deliver their mail matter to them at all. He has closed several firms in this way lately, I notice. One was a man in Chicago who advertised *Bibles* at a greatly reduced price, and then sent *nothing* when money was forwarded him.

With kind regards to all my old co-laborers, I am, as ever,—

"BESS."

Washington, D. C., Feb. 5, 1883.

Now, Bess, I can imagine a sly twinkle in your roguish eyes, as you tell that story about the five-cent store. Are you sure you didn't exaggerate it one bit? Just invite your good husband's attention to the fact that we have to-day expressed him a 5-lb. Jones pail of clover honey, and you please tell him, will you, that it is sent to him to give to his wife for the very interesting article she has sent us, depicting the destitute condition of the Washington honey-market, and also describing the wonderful zeal of the inhabitants of said town, in patronizing five-cent stores? Please do all this faithfully and "truthfully," won't you, Bess, because it comes from your old "boss"? Come to think of it, however, there never was very much "bossing" anywhere around, so far as you and I were concerned. Suppose I say, your old co-worker. But now, dear old friend, may I just say one

word more that isn't jesting? May I not very soon hear the glad news that you are (or have been for some time past) standing with your good husband out before the world, on the side of the dear Master, who has it in his power to give eternal life?

### THE TOY BRICKS.

A SHORT STORY OF ALMOST 30 YEARS AGO.

**M**Y youngest sister sends the following: Before JUVENILE GLEANINGS was commenced I intended to have the little folks hear, through the journal, of a box of miniature black-walnut bricks, made for me by my elder brother Amos, in the year 1854, I think. They were smooth and true, and, if I remember aright, were  $2\frac{1}{2}$  inches in length,  $1\frac{1}{4}$  in width, and  $\frac{1}{2}$  thick. I suppose that, with the machinery he now has, he could make in one minute what then would have taken him an hour to do. A box, with strips of leather tacked from the cover to the opposite side of the box, so it would open from either side (made by that same brother), was a curiosity to many, and now he is editor of GLEANINGS, and yet pleases little folks as well as the older ones. **MATTIE E. HOLMES.**

Medina, Ohio, Feb. 26, 1883.

Was it really so long ago? This sister has now little girls of her own, almost old enough to write for the JUVENILE themselves. A few days ago one of them said, "Come again some time, Uncle Amos, and stay a good long while." I remember thinking at the time I made the bricks (you see I was just 14 years old then), that I was getting to be a pretty fine mechanic, for they were sawed off so true that I could stand ten of them on one end, one on the other, without their falling over. I cut them off in a little miter-box; and when I found my little sister was so much pleased with them, I felt quite happy. Some day I may give you a picture of the curious box that opened on either side.

### "WITH WHAT MEASURE YE METE, IT SHALL BE MEASURED TO YOU."

**T**HERE is nothing in the Bible put there simply to fill up. We are left at liberty to accept or reject its teachings, but are accountable for our privileges. Every good word we have ever heard is a drop of mercy; and as we have "freely received," we should "freely give." While we are under obligations to others for our pleasures, we should make others under obligation to us for their pleasures.

If we would prosper in this world, we must have exercise. Our brain may be ever so ready to act; but if you allow it to feed upon its own vain imagination or morbid fancies, it will grow weak; and through inaction our spirits also pine and die.

If a respectable neighbor refuses to work in the Sabbath-school or the temperance cause, or any work of reformation, that should not deter us from doing our duty. Our friends may be very worthy persons; but should they stammer, or lisp, it would not be very good taste for us to imitate them. We should show them much greater respect by continuing to act our own part.

Some may say they have never taken a step in the

direction of right; and others, "seeing their good works," might stare. Better let them stare till they starve, than for you to neglect the opportunities afforded you for doing good, and your preparation for eternity. If our bees were as selfish as we are, we should soon quit caring for them. Let us profit by their example, and not hesitate to take advantage of every opportunity to do the little or the much our hands find to do. If we did not add one more cent to the ninety-nine, we should never have the dollar. We should not despise the day of small things. "All great reforms move slowly." Let us go forth bravely, sowing seed, and without a doubt we shall "come again, bringing our sheaves with us."

If we were without a home, and a man of wealth and power should offer us one where all our wants might be fully supplied, and yet we refuse to eat and drink, and spend our time complaining, because of our hungry condition, is it probable that we should accomplish much in bringing others where they might receive the same benefit? We are told that our Father has made all things ready, and we are commanded to go out into the highways and hedges, and compel others to come in; and "inasmuch as ye have done it unto one of the least of these, ye have done it unto me;" and the invitation is, "Whosoever will may come."

Anderson, Ind., Jan., 1883.

EMMA MOHAN.

### A LETTER FROM OUR FRIEND VICTORIA FIELDS.

**O**UR teacher being sick, school is closed for the time, and I have had some little time to pay attention to the bees. On the 26th of last month they came out and played as they do in the summer. From one hive they spotted snow all full of yellow specks. What is the reason of that? I called papa, and he hobbled out to the bee-yard, but could not tell the reason, unless it was dysentery. Papa told me to hunt in the A B C. I soon satisfied myself that such was the case. Now, there has been no weather since that when bees could fly, so we moved the straw packing of that hive yesterday, and it appeared damp and frosty; but the bees appeared all right, so we closed them up. Our other hive, the bees came out of, but did not spot the snow. I never felt so anxious about our little pets as I do this winter. I suppose it is because I take more interest in them. Papa says if he is spared, and gets able to work again, we shall have a better way of wintering by another winter.

I like to read Mrs. Harrison's letters. I think almost any person could understand her views of bee-keeping. She is original and plain. Have you bee candy for sale? I lent my catalogue, and it got lost. Papa says I must get some foundation, and try if I can not get a better yield of honey, if the season proves good. I do not think it would pay to sow seeds expressly for bee pasture in this country, when there are so many acres of wild flowers that bloom at almost all seasons of the year. Linden honey will be scarce hereafter in this neighborhood, for the people that own timber are cutting it all for pulp wood.

V. J. FIELDS.

Valley Point, Pa., Feb. 1, 1883.

We have given up keeping candy for sale, Victoria, since we have found the Good candy does so well. I pretty nearly agree

with you, in thinking that, as a general thing, but little immediate benefit can come from sowing seeds of bee-plants. If after you had secured bees enough to gather all the honey that now goes to waste, you had facilities for raising honey-plants by the acre, it might pay, especially if you could sell the seeds, as we do with buckwheat, alsike, rape, and other plants. Tell us about the linden-pulp wood you mention. Is it for making paper? Give my respects to your good old father. I presume the dysentery has not materially harmed your bees.

### "HORSE-TALK" — A SEQUEL.

IT occurred to my mind, quite a while before that article appeared, why something of the kind could not be carried on in the lower back corner of the JUVENILE. But I was afraid to suggest it. Almost all bee-keepers own horses, cows, etc., and would be glad to read short articles of this kind. When I was a boy eight or nine years old, my father owned a fine large horse, black in color. He was noted for his many good qualities in the art of breaking colts. If we hitched a giddy-headed colt beside "old Bill" (for that was his name), and it did not seem inclined to draw, old Bill would walk leisurely along and pull the colt after him. Did colts get stubborn or headstrong, and run ahead, Bill would give him a nip in the neck or ear, and set him back. The colt would worry along for a while, and finally begin to pull. Our old friend became diseased in a few years. Veterinarians were called in, medicine given, but still it was the same. He was exoused from work; we fed him moistened oats, and on this diet he lived for three or four years.

#### BE KIND TO THE OLD HORSES.

Friend Root, you certainly showed some wisdom when you selected oats for a feed for your old servant. "As they stand at the head of the list of the articles for the horse's feed, thrashed oats contain about 740 parts of nutritive matter to 1000, while corn has 650 to 1000." Corn is more heating than oats, which makes it more or less objectionable as a summer feed.

ALBERT KRALL.

Ovid, Ind., Dec. 23, 1882.

### THE "RED LIGHTS."

#### WILLIE'S HIVE WITH NO DRONE COMB IN IT.

SOME days since, I began to write to you; and after having my letter nearly completed I stopped awhile, and picked up the Feb. JUVENILE, and was reading some of the little letters, and finally came to "Red Light No. 1." That did not affect me; but when I came to "Red Light No. 2," I found it fit me closer than my boot; which, by the way, is a pretty neat fit, so I stopped, and put it on.

Now, here I am, and I dare not tell you my pa takes GLEANINGS, but you must suppose we borrow. I did not want you to think that, for I do not believe in borrowing even a bee journal.

And then, again, I must not tell you "my pa keeps bees." Well, I'll tell you I have a stand of my own. A natural swarm issued one morning about the middle of last June, and pa put them in a hive and went to his work on the farm; after he had been gone awhile they came out again, and then I put them

into a Harbison hive, and they remained and went to work, and during the summer filled their hive with comb and honey; but not a cell of drone comb did they build. Now, what am I to do next summer for a drone or two, when my bees swarm? Shall I borrow a few, or buy some drone foundation, and coax them to raise some? I do not believe I'd like to borrow *drones* either. My bees are beautiful Italians; and if I borrow drones I might get a bad mix. I might venture to tell you, "my pa" uses the Simplicity hive, and that mix is just a little odd.

WILLIE HARDIN, age 13.

Keith's, Ohio, March 6, 1883.

I am glad to know, Willie, that you have got your eye on the "Red Lights," even if you don't quite see them as I do. If I were you I should be very glad my hive didn't have any drone comb in it, for you don't want to raise drones in the same hive you raise your queens, "no how." If you have not already done so, just "read up" the whole matter in the A B C.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACTS, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye takin' notes,  
An' faith, I'll prent it."

HOW many of the children are going to have a garden this spring? I think it is real fun to have a little garden, and have it nice and clean. When I am real tired, and worn out with cares, if I can get outdoors and hoe in the dirt with a nice clean sharp hoe, it rests me amazingly. I don't know whether we shall have roots of the figwort enough to sell this spring or not, for they are not up yet; but I think likely we shall see them as soon as the frost is out of the ground. If any of the children want something to do right at their homes, so as to earn some money for themselves, I don't know of any thing nicer than raising seeds of honey-plants. The spider-plant seed is very easy to raise and gather; and at the price we have had to pay this season, one ought to get rich raising it. It seems wonderful to think of it, how so many of you are sending us seeds from all over our country, and at the same time others are sending to us for the seeds which we send daily, almost

all over the world. While I think of it, we are just now commencing to build another factory, or wing, rather, so as to accommodate "Eliza" and the rest of the girls, when they are putting up seeds and other goods for you. It is to run out along the road where you see the man just starting off with a load of bee-hives, in the picture in the A B C book. Now, children, I am going to stop and let you write, for we must remember this is your journal, and you are not to be crowded out by old folks. Don't forget the garden for bee-plants.

#### 36 COLONIES, AND LOTS OF HONEY.

My pa has 36 swarms, and I have one. Pa got lots of honey in sections. I like honey.

J. EDWARD WINTER, age 8.

Becknell, Knox Co., Ind., Feb. 5, 1883.

My pa has 27 stands of bees. They are all in good condition. But we hear from all around in the country, that a great many died this winter.

ERNEST HOLLENBACH, age 12.

Noblesville, Ind., March 1, 1883.

#### HONEY CANDY, AND CANDIED HONEY.

Pa has 53 hives of bees; 33 are in chaff hives. Honey makes good candy, if you boil it down.

SIDNEY BRICHER, age 9.

We have a barrel of honey, and it is all sugared solid.

ANNIE BRICHER, age 11.

Decorah, Iowa, Jan. 3, 1883.

I can help my sister to wash the dishes. I have three sisters and one brother. I like bees, and I like to watch them in the summer. In the winter they don't fly. Pa has bees, and he likes to watch them.

SARAH J. BRECHTEL, age 8.

Newburg, Cumb. Co., Pa., Feb. 26, 1883.

#### "GRANDMA'S BEES."

Grandma bought two hives of bees in old box hives last Sept. for \$12.00. She says she is green, but is going to learn to attend them, and sow nice flowers for them this summer. They worked thick as could be on seed onions and Windsor beans.

JENNIE V. LIGHT, age 11.

#### HOW THEY MAKE SWARMS ALIGHT AT EMMA'S HOUSE.

Pa has got 16 stands of bees; 3 years ago he had only 2; they made lots of honey last summer. I had to watch the bees, for when they swarmed we would get tin pans, and drum on them to make them alight.

EMMA QUAIN, age 12.

McDonald, Vanburen Co., Mich., March 8, 1883.

#### FROM 4 TO 10, AND 40 LBS. "CAP" HONEY.

Mr. Kilts has 10 swarms of bees. We had 4 colonies to begin with in the spring. We got 40 lbs. of "cap" honey. He has them packed in straw. We looked at them last week. They were all alive but one swarm. I am living with Mr. Kilts.

WILLIE L. PARMELE, age 12.

Sharon Center, Scho. Co., N. Y., Feb. 27, 1883.

#### A SHORT STORY, WITH A PLAIN MORAL.

Pa had 18 colonies in the fall, and it is coming spring now, and several colonies are dead. Tho bees fly out of the hive and drop on the snow, and die. A stabbing affray took place in Indianola a few weeks ago between a couple of young men. They were playing cards.

LOU HALL.

Indianola, Warren Co., Ia., March 5, 1883.

#### JOSEPH'S MISHAP, AND WHAT THEY DID.

My father keeps bees. In 1882 he had 17 stands, and now he has only 10 left. Last summer my brother Joseph was hiving a swarm that was in a neighbor's tree, and he lost his hold, and all the bees fell down on him, and he ran down the garden, screaming, "Water, water, water!" and we got a bucket full and he dipped his head in, and then we pumped more on his body. I have 5 brothers and 3 sisters; the baby's name is Walter Thomas, and he has pretty blue eyes.

MARTHA DODDS, age 10.

Lonaconing, Md., March 5, 1883.

#### HOW SOPHY'S FATHER INTRODUCES QUEENS.

My pa has 8 swarms of bees. They are in the cellar. He started with 1 lb. of bees and an Italian queen. He had two swarms of black bees that he got from one of our neighbors, and he made them Italians by introducing queens. One was a honey queen which he got from you. My pa introduces queens by caging the black one, and leaves it in for a few hours, then changes the cage, putting in the Italian, and leaves it in for 24 hours, and then lets her out. He has never lost a queen in introducing.

SOPHY SEELY, age 11.

Greenville, Mich., Feb. 25, 1883.

#### FROM 2 TO 8, AND 25 GALLONS OF HONEY.

My pa has 8 stands of bees; he had two old stands last spring, and he extracted 25 gallons of honey, and increased them to 8 stands. We all like honey, and I think a few stands of bees will beat a sugar-cane patch. I like to help work with the bees. I love to see the busy bee gathering flowers to make honey.

SIME CAHR, age 11.

Maysfield, Milan Co., Tex., March, 1883.

Why, "Sime," do the bees really gather flowers and all, down your way? I never heard of that before, although I have seen them take out long strings from the inside of flowers. That is a pretty good report, any way.

#### CHESTNUT HONEY, ETC.

We have 24 stands of bees; nearly all in very good condition. I have one stand, and papa is going to give mamma and my brother Wesley one stand each. Mamma says she wants to try your plan of putting grapevines near the hive. Grandpa White was 82 years old last January. He took 160 lbs. of box honey from one of his hives. The first honey we took off was very white and nice; but the last was quite dark. Papa said the dark was made from chestnut bloom, and the white was made from white clover and blue thistle. Where in the Bible does it say that John the Baptist ate locusts and wild honey?

HUGH J. WHITE, JR.

Broad Run Sta., Va., Feb. 21, 1883.

#### FROM 3 TO 8, AND THE REASON WHY — NOT MUCH HONEY.

We had 3 stands of bees last spring. They are black, and they increased to 8 stands last summer. We did not get as much as some others who keep bees, because 3 of them were in the old-fashioned box-hive. I have to watch bees in summer. I like to see them swarm. When a swarm comes out, and pa is not at home, mamma hives them, if they are not too high in a tree. Papa wants me to thank you for the bee journal you sent him. He wants to buy some new hives this spring, and wants you to send him a price list. He will come out to see you some time this spring.

LOUISA A. RINDSPACH, age 11.

N. Ridgeville, O., Feb. 21, 1883.

Well, Uncle Amos, I wish you had been here the 15th and 16th to see how many bees were in the air. Our 60 stands are all alive and strong; 12 weeks since they had a fly before. MARY RIGGS.

Fairbanks, Ind., Feb. 20, 1883.

"BAD, VERY BAD LUCK."

Papa has had very bad luck with his bees this winter. He had 7 colonies, and they are all dead but 3. MARY S. HAUGHT.

Munday, Wirt Co., W. Va., Feb. 12, 1883.

NOT QUITE FROZEN.

My father has three colonies of bees, and mamma helps him to attend to them. One of his colonies pretty nearly froze to death. He brought them into the house and gave them some syrup.

LINA GILES, age 13.

Waterford, Ont., Can., Feb. 17, 1883.

A CRITICISM FROM A LITTLE GIRL.

Our little girl is very much interested in the JUVENILE; nothing in it escapes her notice. She discovered yesterday that Luke 10:16 doesn't read as you make it on first page. M. H. HUNT.

Bell Branch, Mich., Jan. 20, 1883.

Correct; it should be 16:10.

MY "VALENTINE" LETTER.

My pa had 15 colonies last spring; increased to 43; 9 left. I ran about a mile after a large swarm. They got away from me at last. I have a nice little sheep, and I have lots of fun with it. You can keep this for a valentine, if you choose.

LILY O. BUNDREN.

San Antonio, Bexar Co., Texas, Feb. 14, 1883.

THE EFFELBOWER CHILDREN.

Pa got nearly 500 lbs. of honey. I tell you, the bees make me jump when they get in my hair.

BENNIE HEFFELBOWER.

My pa had three swarms last spring, and he has 17 now. One of them died. Pa's sting me when I go out and disturb them. EDDIE HEFFELBOWER.

Cass City, Tuscola Co., Mich., Feb., 1883.

THE WAY SUSAN HELPS HER FATHER.

I help my pa carry the frames to the extractor, and then I carry them back to the hive again. Please send me a book. SUSAN MISHLER, age 8.

Ligonier, Noble Co., Ind., Feb. 23, 1883.

Why, it seems to me, Susan, that any little girl who helps her pa as much as that should have a book, even if her letter is short. Don't you? We send the book.

THE "FIRST PREMIUMS."

Papa has 18 stands of bees in the cellar, and they are doing well. He took a hive of bees to the fair, and got the first premium; also first premium on honey and bee-hives, and second on extractor. I took a basket of paper flowers to the fair, and got first premium. ELLA EDMISTON, age 9.

Adrian, Mich., Feb. 5, 1883.

HONEY-DEW, ETC.

I wrote you a letter last summer, and got such a nice book, called "Madie Grant," that I thought I would write you another. I have just been out and counted 40 stands; pa thought we got about 2000 lbs. We had honey-dews here nearly all summer; it was mostly on hickory-trees. Some say in your journal that it does not make good honey; but pa thinks that it is very good. NELLIE TOMLINSON.

Villisca, Iowa, Jan. 8, 1883.

ONE-HALF LOST IN WINTERING.

My first experience with bees was when I was little. I took a stick and poked into the entrance, and they came out, and some of them stung me severely. Last fall we had 35 swarms, and now they are half dead. Pa thinks it was caused by bad honey.

Chardon, O., Feb., 1883.

CARL C. COWLES.

ONLY 2 OUT OF 50 LOST IN WINTERING.

Pa had 52 swarms of bees when winter began; but two of them died. The rest of them are all right so far; 32 are packed in sawdust, one in chaff hive, one in double box hive, one in hive lined with straw. The rest are in the cellar. SUSIE D. BECHTEL.

Caledonia, Mich., Feb. 26, 1883.

LOTTIE'S STORY.

My pa has 14 stands. They are all alive, and have had a nice fly for several days. I like bees, but I like their honey better. There is a poor man in jail for forging notes. He sent for pa to come up and see him. Pa went and talked with him a couple of times. LOTTIE SHUSS.

Pawnee City, Neb., March 4, 1883.

You see, Lottie, how quickly wickedness brings trouble. Truly, the wages of sin is death.

We have 9 hives of bees in Simplicity hives. They are Italians. We got two queens of you, and one imported one from Mr. McCormic, of Fredericksburg, last summer. They are wintering all right. We winter in the cellar; we had them out once, to take a fly. We feed oatmeal ground fine, and placed on a board in the yard in the spring, when it is warm enough. I have two Canada ring doves and one canary bird. CYRENE H. GEITGY.

Wooster, O., Feb. 28, 1883.

HONEY THAT DIDN'T CANDY.

I thank you for printing such a nice journal for us children. Father has his bees in the cellar. I should like to see Blue Eyes; my eyes are blue too. Mother drained honey out of broken combs, and put it in two half-gallon jugs and one-quart Mason jars. We kept the jar in the kitchen cupboard. When we wanted to use any, we opened the jar. We used the last of it last week, and it was just as nice and clear as ever. Mother opened a jug the other day, and found the honey just as clear as when put up. The jar was white-clover honey; that in the jug was dark honey, put up in September.

LOUISA L. HUNTER, age 12.

Kendallville, Iowa, Jan. 8, 1883.

INA'S BEE VEIL.

I like to help take care of the bees. I wore a piece of mosquito bar tied over my sun-bonnet for a veil, when I helped mother take out honey last summer. I did not have any thing over my hands, and I did not get stung once. I have a little blue-eyed brother 18 months old. He was very sick week before last, but is well now. His name is Christian. It takes us all to keep him out of mischief. Oh dear! I guess I'll ask mother to please copy my letter. I had to ask her how to spell the long words, anyhow; but I think it will be just the same; don't you, Mr. Root? INA ISABEL HUNTER.

Kendallville, Iowa, Jan. 8, 1883.

I should like to see you, Ina, with your bee-veil on. To be sure, it is all the same if you ask your mother how to spell the long words; in fact, I think it is a great deal better, for you learn to spell that way.

## A JUVENILE REPORT.

Pa gave ma a little swarm of bees last summer; but they starved this winter. Pa sold all of his bees last fall. He was afraid they would all die, so we have none now; but we will get some in the spring.

ERNEST HANSFORD.

Troy, Gilmore Co., W. Va., March 1, 1883.

Why, Ernest, I should think yours almost a report for "Blasted Hopes." Did your father sell out because he was afraid they would starve?

## FROM 2 TO 5, AND 150 LBS. OF HONEY.

We had two stands of bees last spring, and they increased to 5 during the summer. We received about 150 lbs. during the fall, from 2 stands; we did not get any honey from the other three; one or two swarms went off before we could get them hived. Our bees are black. We have the Champion hives, but pa is falking of getting some Simplicity hives this spring.

WALTER COMIN, age 13.

College Springs, Ia., March 6, 1883.

## "AUNT DRUSIE'S" WAY OF CATCHING SWARMS, ETC.

My Aunt Drusie has a frame of comb fastened to a long pole for the bees to alight on whenever they swarm. It is real handy. She thinks chaff hives are the best. I go to the Methodist Sunday-school. We have a nice library of 136 volumes. There is a lady living near here who used to be a great bee-woman, but now won't have any thing to do with bees, because she once got stung very badly. She does not believe there is any queen bee. Isn't she a strange woman?

EDNA GREAVES.

Moawequa, Shelby Co., Ill., Feb. 26, 1883.

## ALBERT'S FIRST LETTER.

As my pa was sending for your journal, I thought I would write a few lines to let you know that I work among bees. My pa has 10 stands of bees this winter, and I help him to put them away in the beehouse. I smoke the bees when pa takes out the frames. Last year was not a good one for bees here. I go to school every day, and I help pa do the chores morning and night. We have a sawmill, and pa runs it in the winter. This is my first letter.

ALBERT McCURDY, age 11.

Hornby, Ont., Can., March, 1883.

## WINTERING BEES UNDER A SNOWDRIFT.

Do you know that a big snowdrift is a good place for a hive of bees to live in, such a cold winter as this has been? My pa has two hives near the hedge that was all covered over about 3 feet deep. He thought, "Poor little things!" but he thought he would just let them alone, to see how they would get along. So one day when it was warm he dug a hole down to see if they were alive. The snow had melted around the hives; and as soon as the daylight came in, the bees came out as if they said good-morning. They were under the big drift 6 or 8 weeks, and seemed to be happy.

JACOB J. BRUBAKER, age 8.

Maxwell, Story Co., Iowa, Feb., 1883.

Yes, Jacob, a snowdrift is a very good place if we can keep the snow dry, and have it cover the hives all winter.

## A RUNAWAY SWARM; HOW THEY CAUGHT THEM, AND WHAT CAME OF IT.

I live on a farm, and I help papa do the work. I have 4 brothers and 2 sisters. One of my brothers

and I were working in the garden when a swarm of bees came flying over us. We began pitching dirt into them, and my brother ran to the house and told mamma, and she came running out to the garden with an old pan and a stick, and she commenced pounding on it, and my brother and I kept on pitching dirt; mamma kept pounding on the pan till the bees settled on the fence, and my brother ran over to a neighbor's and got a hive. Papa was away; and when he came home he put them into the hive, and they made about 50 lbs. of honey that season. It was the 4th of June, 1881, and in 1882 they increased to 5 stands of bees, and we got 45 lbs. of honey that season. This winter we have lost one stand of bees, and papa thinks from what he has learned in the A B C book it was dysentery. Papa claims the bees, and we all like the honey. My papa takes GLEANINGS, and he thinks there is nothing like it.

JESSIE H. BULL, age 13.

Sidney, Ohio, Feb. 22, 1883.

## BEES, PRINTING, AND GREENHOUSE PLANTS.

I am much interested in reading the letters in GLEANINGS. We keep bees. Last fall we made some cushions of coffee-sacking, and filled them with chaff, and placed them in the caps of the hives to keep them warm, and to absorb the moisture from their breath. Pa also made some board houses, open on one side, and set them over the hives, and filled in between them and the hives with straw. We have a printing-press, and I sometimes help pa set type, and print. I send one of my cards to Caddie, as a specimen of my printing. Pa keeps a greenhouse; one wing of it caught fire and burned down, with \$400 worth of plants, the evening of Jan. 22d; but we have rebuilt it, and have it ready for plants again. I will send you one of pa's catalogues.

VERNA V. ABBOTT, age 9.

Morena, Mich., March 1, 1883.

Well, I declare, Verna, you must be a busy sort of people at your house; and if you have such an eye for all the business going on at only 9 years old, I should think likely you would be a busy woman when you grow up. May God bless you all!

## DOES THE OLD QUEEN LEAD OUT THE SWARM?

I write to you for information in regard to bees swarming. The question which I wish to ask you is, whether the young queens leave with the swarms, or the old ones. Some say the old, and some the young queens. Please inform me through your next JUVENILE, giving me the thoughts of other good substantial bee-men.

WILLIE TRIMBLE.

Washington, Ills., Jan. 18, 1883.

The time has almost gone by to discuss such questions, friend Willie. When we had bees in hollow trees and box hives, we had to guess and speculate; but now it is all as open and plain as the broad daylight. The old queen leads out all first swarms, as a rule. The exceptions are usually caused by the death of the old queen, or something of that sort. If the same swarm sends out a swarm the same season, the old queen leads as before, so she keeps traveling from one hive to another, as long as she lives. That is, she travels every time a swarm goes out. Bees don't seem to approve of the idea of setting a young miss at housekeeping in a new house, when they can send out an old hand.

## FROM 5 TO 10, AND 300 LBS. OF HONEY.

I started one year ago with 5 colonies; increased to 10. During the summer I took off 300 lbs. of section honey, for which I received 15 cts. per lb. My bees are in fine condition up to this date. I expect to have a grand time with them next summer. I love the little fellows.

J. P. ALSHOUSE.

Evansport, O., March 8, 1883.

And well you might, friend A.

## FREDDIE AND LULU.

My pa keeps bees. I have a stand in nice condition. Pa says I must learn to manage the bees. I go to Sunday-school. I have a little brother; he says he is a honey boy, but not a bee boy.

FREDDIE GRIFFIN, age 9.

We live on the river, very near the railroad. It is a good place for bees. There are lots of willow and maple trees. My papa has a few stands of bees. I do not know much about them, but expect to learn this summer, and tell how I got along with them.

JULIA A. GRIFFIN, age 12.

Shadwell, Va., Feb. 6, 1883.

## FROM 3 TO 8, AND 300 LBS. OF HONEY.

Pa had 3 swarms of bees in the spring. They were in the old box hives. His were natural swarms and they increased up to eight, and he took 300 lbs. of honey. He got 16c. per lb. for it. It is so cold here that the bees can not get a flight. He lost four swarms this winter with the dysentery.

WM. J. OGDEN, age 12.

Arkona, Ont., Can., Feb. 23, 1883.

## WHEN BEES ARE CROSS.

My uncle keeps bees. They are hybrids; they had no honey when he first got them, and we could handle them any way until they got their frames full of honey; then they were awful cross. They were all right a few weeks ago.

DAN LIGHT.

Port Burwell, Ont., Can., Feb. 14, 1883.

I think, Dan, you haven't got it quite as you intended to. The bees are generally very peaceable when they are getting honey every day; but as soon as it begins to be hard to find, then they get cross.

## METHODIST BEES, AND "BABY-QUEENS."

Pa says his bees are Methodist bees, because they do not swarm on Sunday. Pa had some little hives, and he said he was raising baby-queens in them. Is that the way you raise baby-queens? I hope you will not be offended at me for writing to you. I am not very good at writing letters yet, but I am studying very hard. Ma is waiting to take me to bed. I read a few verses out of my Bible before I retire.

ADA STURGEON, age 11.

Kincardine, Ont., Can., Feb. 23, 1883.

## BEES BETWEEN THE FLOOR AND CEILING.

My pa has 15 colonies of bees. He likes to work with them. The first we had pa found in our house between the garret floor and the ceiling. When he took it out it had quite a lot of honey. He did not know how to manage bees then, and they died; but since then he has studied the A B C book, and reads GLEANINGS.

JOHN G. BASEHORE.

Mechanicsburg, Pa., Feb. 22, 1883.

Bees must be badly off in your neighborhood, it seems to me, John, to take up such quarters for a hive. I hope you and your pa will give them better accommodations, now you have the A B C book.

## FROM 1 TO 4, AND 125 LBS. OF HONEY.

This is my first letter. My pa got a stand of bees from B. F. Little, June 23, and we have four stands now, and expect to get 125 lbs. of comb honey. I hope they will come out all right. They are in good condition now.

A. W. HOWARD, age 8.

Randalia, Fayette Co., Iowa, March, 1883.

## A 6-YEAR-OLD "CONTRIBUTOR."

I am a little boy six years of age. My father keeps bees, and 19 partridge-cochin chickens. Pa and ma want to buy a farm and go to the country and get some sheep and cows and horses. I never went to school one day, but I can read in the First Reader. My pa and ma taught me at home. This is my first letter.

GEORGE M. POGUE.

St. Clairsville, O., Feb. 23, 1883.

## JOHNNIE'S BEES THAT WERE FOUND IN A CORNFIELD.

Pa has 41 hives of bees. He has two Holy-Land queens, which are very nice. I love to watch the bees work, but I am afraid of them; they don't like me very well. Pa extracted 2000 lbs. of honey last summer. I have one hive of bees. Pa found it in the cornfield, and gave it to me. It had settled on the ground. They were black bees. He took the black queen away from them and gave them a frame of brood, and let them raise an Italian queen. Bees here make honey mostly of horsemint.

JOHNNIE A. KEMP, age 10.

Maysfield, Milan Co., Tex., Feb. 18, 1883.

## STRAWBERRIES AND HONEY.

My pa has 11 swarms of bees. He uses the L. hive. He bought 4 Italian queens. He has one swarm of hybrids, and one of black bees. I think it is fun to give them honey on a plate, and watch them with a magnifying-glass. We have 11 acres of strawberries to pick. Pa says I have got to take care of them; but I don't think I can. I sometimes tend the smoker for him.

LOTTIE M. HARRIS, age 12.

Well, Lottie, I don't quite think I could take care of *eleven acres* of strawberries, but I might take care of a small basket full, if I should happen along in berry time.

My brother found a swarm of bees in an oak-tree, and that started pa to keeping bees.

FREDDIE J. HARRIS, age 10.

Toledo, O., Jan. 21, 1883.

## A LETTER FROM ONE OF THE CITY ORPHANS.

I am an orphan boy. I came from New York city with a carload of children to find homes in the country. I have a good home. One of the girls, Hannah Williams, keeps bees. She takes GLEANINGS, and sends for things. Last fall, when they put the bees in the cellar they found the bees in one hive all on the ground under the hive, dead. The inside of the hive seemed all right, and there was a plenty of honey; but we didn't know what made them die. I like honey, and have all I want to eat. I like to be around when they extract. We have twelve stands of bees. I came here three years ago, and did not know all the letters; now I read in the Fourth Reader, and study part third of geography, and am ciphering in factoring.

GEORGE RODNER, age 11.

Springville, Ia., Feb. 20, 1883.

George, you may thank God for being rescued from the life you might have led, and for the good Christian home you have found. I think you have done pretty well for only three years.

## THE FISHER CHILDREN AND THE BEE-TREE.

My pa had 3 hives of bees in the spring, and now he has ten. He got lots of honey from them. The 12th of February he had my uncle and one of our neighbors cutting logs for him; and as I heard the tree fall, my little sister and I ran to them and went up in the tree-top, and I thought it curious to see bees flying around there; and so I went on a little further, and found the bees. It was late in the evening, and we put a quilt over them and let them stay till the next day about noon, and then we took the hive and hived them. My pa put them in the house and let them stay a day or two, and then put them out where the other bees were, and the bees began to rob them; and then he took them back in to the house and began to feed them. My school is out now. I went every day. There were 98 days, and I missed but two lessons.

FRANKY FISHER, age 11.

My pa has bees, and I help him tend to them. He takes GLEANINGS, and I read so much about little children writing, I thought I would write some. My mother has 9 birds, and I help her tend to them, and I wash the dishes for her. LELA FISHER, age 9.

Maplewood, Ind., Feb. 21, 1883.

## FOUR-YEAR-OLD HARRY'S EXPERIENCE IN BEE CULTURE.

My papa works in the sash factory. One night last summer when he came home he said, "Who has been taking the covers off the bee-hives?"

Our four-year-old Harry said, "I did, papa, but the bees bit me so I could not put them on again." I am left-handed.

ANNE V. D. CASE, age 9.

## THE HIVE THAT WAS QUEENLESS, ETC.

We began keeping bees last spring. Father purchased three swarms of what were called Italians, but we have made up our minds that they are hybrids. One swarm proved to be queenless; but we did not take any bee paper, so did not know what was the matter. After some time an old man came to our house, and was looking at the bees, when he discovered that there was no queen. The swarm became reduced so much that we put the rest of them in with another swarm and now we have two nice colonies. I think we shall have no more trouble, now that we take GLEANINGS. Father is going to send for an A B C book.

## STONE FOR HIVE-COVERS.

There is a stone-quarry a little way out of town, and father was there getting stones to flag our cellar bottom, when he found some very thin ones, which the man gave him. He brought some home, and made covers for the Simplicity hives. First he squared the stone, then took a common pick punch and marked it around. Then he broke it across a saw-horse. It is as true as slate. The stones are from  $\frac{1}{4}$  to  $\frac{3}{4}$  of an inch thick. I should like your opinion in regard to the stone covers.

HATTIE L. CASE, age 14.

Sherburne, Chenaug Co., N. Y., Feb. 20, 1883.

I think they will do tiptop, Hattie. They won't warp, rot, leak, nor get blown off by the wind. If you rub two against each other, you can make them as smooth as a board. Thank you for the idea, little friend.

## A YOUNG BEE-MAN'S LETTER.

I am ten years old, and have had to watch the bees all summer for five years, to see when they were going to swarm. I can hive them alone, so you see I

ought to know something, so I am going to tell you something new for the JUVENILE. I guess it is new, because I don't see it in any of your bee-papers or books.

## CHARLIE'S PLAN FOR UNITING NUCLEI.

When you want to double up your nuclei in the fall, or weak hives in the spring, just lift all the hives and set them close to the one where you are going to leave them. Lift out all the frames, and shake all the bees down in front of the hive; cover the hive up; move all the hives and the fixing that had the bees in; then take a little hammer and rap on the side of the hive till those inside roar again; then these fellows outside think they are swarming, so they will all run in, and those that are flying will all come in too, and stay there without fighting.

CHARLES WHITFIELD.

Dundas, Ont., Can., Feb. 19, 1883.

Your plan is a very good one, Charles, and the drumming you describe will usually cause them to accept the new location, and adhere to it, just as if they were a natural swarm.

## THE HEN BUSINESS.

I have been reading the JUVENILE, and I see that you have been in the hen business. I wish that you would write some more about hens. That is what interests me the most, for I am in the hen business. I am going to see what a girl 10 years old can do raising chickens this summer. I want you to ask some of your nieces if they want to see who can raise the most chickens this summer, then we will write and tell you in the fall.

Our bees are in the cellar yard, and they want to get out very much; but the yct where we keep them is full of snow. Papa let his bees fly last year the 10th of February.

GERTIE S. HALL.

Northfield, Minn., March 1, 1883.

Well, Gertie, we have got about two or three dozen hens; but they find so many places to hide their nests in our big warehouse, that we can never find them. If you know of any little girl who is *real good* at finding hen's-nests, I wish she would come and help us get the eggs.

## ABOUT THE BEES, AND HOW TO MAKE HENS LAY, &amp;C.

Pa got 1400 lbs. of extracted honey from 35 stands last summer, and we extracted about 18 lbs. last Saturday.

If you want to get a heap of eggs, take red pepper and dry it by the fire, so you can mash it, and mix with the feed; then give it to the hens once a week. I see so many of you are asking Bible questions, I thought I would ask one. Where was Moses when the light went out? Sister Fannie has written a letter, and send it with mine.

BETTIE G. FARIS, age 13.

My pa has been keeping bees for 15 years, and has a sawmill on his farm. Our chickens have the cholera. Do you know what will cure them? I help my two little brothers haul fodder, and we have the most fun on top of it. I have a little brother, as sweet as a peach, and he has blue eyes.

FANNIE M. FARIS, age 9.

Town House, Smyth Co., Va.

And so you are Mr. Faris's children, are you, Bettie and Fannie? We know him, for he is the man who makes fdn. with plaster molds. Thank you, Bettie, for telling how to make the hens lay. I don't know how to

stop the "hen cholera," unless it is to keep them clean.

FROM ONE OF OUR CANADA JUVENILES.

My pa has two stands of bees; he bought a stand last spring. They swarmed once; we packed them in sawdust last fall. We take GLEANINGS. I like to read the children's letters in the JUVENILE. We live on the farm adjoining Mr. John Calvert's. We knew Albert, and were very sorry when we heard of his death. He was a nice, quiet boy. This is my first letter.

EDWIN FLEMING.

Reaboro, Canada, Feb. 6, 1883.

We do not take GLEANINGS, but my uncle does, and I get the JUVENILE to read. I like it very much. We have four stands now. We did have 7, but 3 died during the winter. I go to school at the White Sulphur Springs. I study grammar, U. S. history, etc. I like to go to school. I have one little sister three years old. We have been keeping bees for three years, and I have been stung but once. I like bees, and honey also. Our bees suck the spider plant.

JOHN W. CALDWELL, age 11.

White Sulphur Springs, Ga.

ERNEST'S REPORT.

Papa bought two queens and 2 lbs. of Italian bees from you last June, and now we have 10 hives of Italians. He has them all nicely packed in chaff. I think chaff and foundation are good things for bees. Our bees have wintered well, and on the 3d day of February, they worked all day and cleaned up their houses for spring, and on the 15th they were gathering pollen; but I do not know where they found it.

ERNEST B. DAVENPORT, age 11.

Hodgenville, Ky., Feb. 25, 1883.

ONLY 22 LEFT, OUT OF 37.

Out of 37 hives of bees we have 22 left. For the last few days they have been flying almost as in swarming time, bringing in pollen. Papa says they get it from maple and other flowers. We have been feeding them on sugar made from sugar-cane. They like it very much. From the other bees that died we got only 2½ lbs. of wax. We had a swarm last October. They are living, and doing as well as the others.

NETTIE MILLER, age 12.

Minden, La., Feb. 16, 1883.

"CHUB" AND HER FATHER, "LITTLE BEN."

My pa has kept bees for the last 25 years. He has 79 swarms now, all packed in chaff. I helped him pack them. We have lots of honey and sell it in Albany. I am a big boy; my pa calls himself "Little Ben." He weighs 220 lbs. I have a little blue-eyed sister about a year old, and I think she is pretty. Her name is Myra, but we call her "Chub." Pa is going to send for one of your scales, and then I will weigh her.

EARL AUCHAMPAUGH, age 8.

West Township, N. Y., Feb. 27, 1883.

HOW THE BEES WERE SAVED FROM BRIMSTONING.

One of our neighbors last fall was going to brimstone one of his colonies. Pa told him that he would take the honey for him if he would let him have the bees. The 2d of November he took the honey and brought the bees home, and fed them up, and they are now in good condition. Pa gave me one colony, but it has become queenless this winter. Can you furnish me a queen by April 1, and at what price? My Simpson plant did well last summer. Pa has 12 stands.

J. A. SHENEMAN.

Pharissburg, O., March, 1883.

A HONEY-HOUSE WITH LEGS TO IT.

Pa has 100 colonies. He has a honey-house with legs under it. The legs stand in small pans, and in the summer we fill the pans with water, so the ants can't get in and bother pa and eat the honey. I have a brother 10 years old. His name is Willie.

RENNIE MOREHOUSE, age 12.

Mombaccus, N. Y., Feb. 15, 1883.

Very good, Rennie. I suppose your pa gets up into that house and just puts his thumb against the side of his nose, and then wiggles his fingers at the ants, doesn't he? Very likely the ants look up at him "discouraged like," and don't say a word back.

A BUMBLE-BEE STORY.

My Uncle Edwin keeps bees; my Uncle Harry keeps bees too, and my papa raises flowers. I go to school and Sunday-school and church. I lifted up a board and saw a lot of bumble-bees, and one stung me. I like the bees that make honey. I like the honey better than the bees. The bees get honey from clover and mint. I wrote the best I could.

ADA GRANIGER, age 9.

Deer Park, Ont., Can., Feb. 23, 1883.

I dare say you did write the best you could, Ada, and it is very well indeed for a 9-year-old "chick." Somebody has said, that when we do the best we can, "angels can do no more."

FROM 20 TO 53, AND 3000 LBS. OF HONEY.

Pa has 53 colonies, and I have one. They are on their summer stands, all covered with straw about a foot deep, and are all right so far as we know. Feb. 19th being a nice day, pa opened 8 or 10, and they had a flight, and to-day pa and I opened all, and they flew lively. He received from his 20 colonies, spring count, 2500 lbs. of extracted honey and 500 lbs. of comb honey; and I, from my nuclei of four sash, 47 lbs. of comb honey and 53 lbs. of extracted honey.

LEWIS H. TRESTER, age 14.

Lincoln, Neb., Feb. 21, 1883.

JOHNNY'S HONEY CROP, AND HOW HE DISPOSED OF IT.

I have only one swarm of bees, and I won't have them unless they come out all right in the spring. They are a second swarm. My papa gave them to me for tending his bees in swarming-time. They made 30 lbs. of surplus honey in one-pound sections, besides filling their hive. I sold the honey in London for 22 cts. a lb., and bought a stem-winding watch at five dollars, so you see when I am tending bees the coming season I can tell exactly the minute they swarm. It has been very deep snow here; the thermometer has been as low as 14° below zero.

JOHNNY COLEMAN, age 12.

DeVizes, Ont., Can., March, 1883.

JOSEPH'S LETTER, AND HOW HE WROTE IT.

Brother Jimmie wrote you a letter, and got a book. Ma said I might, for I wanted a book so bad. Ma holds my hand while I write. Ma said she did not know whether you would send a book or not, but I might try. Papa is going to send to you for some goods before long. His bees are doing nicely, and flying lots to-day. JOSEPH H. WALLACE, age 6.

Wheatland, Ind., March, 1883.

Such a letter will do tiptop, Joseph, and I hope that it will be not only while you are learning to write that you let your mother hold your hand and guide you, but that even

when you are a big grown-up man, your hand may be often in hers, and that her pure love may guide you.

#### MOVING BEES FOR BETTER PASTURAGE.

Last December my brother, W. F. Miles, moved 120 stands of bees over a mountain road, to a little town about 70 miles from here, on a big wagon, with 4 horses. We have 50 stands here of our own, and 50 of another man. The weather is quite warm, and the bees are carrying in lots of pollen. It was not a good honey season here last year, and not a good prospect for one this year. My brother expects to be at Lompoc a good deal this year with his bees, and so I shall have to help with the bees here. One of our neighbors is a nephew of I. R. Good, the man who writes so much for the GLEANINGS.

LAURA MILES, age 13.

Santa Barbara, Cal., Feb. 27, 1885.

Your description of moving the bees is very good, Laura; but you didn't tell us whether it was a paying speculation or not. Did he get lots of honey to pay for all that trouble?

#### IVA'S REPORT.

I assist father in watching the bees and putting sections together. Four years ago father bought one swarm of Italian bees. Two years ago bees did not do well; the season was poor; they swarmed much; made little honey. My father commenced the first of August to put back all that came out; hived them in a cap, and put them on the hive they came out of. Father kept his in the cellar. They came out strong and healthy in spring. When weather in winter will admit, he puts them out once before spring. I do not know the whole amount received last year. Some swarms produced two more, some three, and 120 lbs. of cap honey. He has sold 24 swarms; has 50 now in cellar.

#### A FUNNY BEE-TRIE.

My uncle found bees in a large hollow sycamore-tree lying on the ground. There was more than one barrel of comb well filled. Some of it was very white. The bees were working in one end.

IVA M. BAILEY, age 11.

Shepherdsville, Mich., Feb., 1883.

#### POLLEN FROM THE ELM.

On the 27th day of this month the bees were out in force, and returned carrying in the gold-dust on their legs. They gather it from the water-elm trees, which grow on the bank of the creeks; they are budding now. "Wiggins'" cold wave rolled down upon us, and froze some of our little darlings. I notice the bees bringing the dead ones out. The bee-tree stands it the best, as I see less dead ones about it. May be it is the best hive, after all.

#### REPORT FROM THE GOOD CANDY.

Pa fed the bees last week, some Good candy mixed up with white granulated sugar and honey about like dough. The bees sifted the honey out, and left the sugar as it was before being mixed; and I noticed they were bringing the grains of sugar out of the hive. How is this? We shall get swarms in one month from now. Pa has the "Early Texas Prolific Black bee." Do you want a queen?

TOMMIE H. MULLIN.

Oakland, Texas, Jan. 30, 1883.

I don't believe I do, Tommie. Many thanks, nevertheless. Much obliged for your report about the Good candy.

My pa has 16 swarms of bees in the cellar, doing nicely. Last summer he got over 50 lbs. of honey from them. The night they were taking the bees into the cellar, they saw an owl in one of our maple-trees, and my brother shot it, and my mother had the taxidermist stuff it. My brother has a gun and a dog, and he goes a hunting when school does not keep; but the dog catches almost all of the rabbits. I can ride our pony, for I have a side-saddle. I can harness our pony to the buggy.

NELLIE G. WHITNEY.

Rockton, Wis. Co., Wis., March 4, 1883.

Can harness the pony to the buggy, only ten years old, and a girl at that! My sakes! but aren't we getting smart? I wonder how many of the rest can do as well. I know some little girls who sometimes think they can't even bring the eggs.

#### LOOK OUT FOR STINGS ON THE EYE, ETC.

My father got stung on the eyelid last summer. The sting worked through into the ball of the eye, and the doctor had to dig it out. He was very sick for a long time. I am getting a collection of postage-stamps. When you get letters from foreign countries, will you please send me the stamps on them, and I will pay you for your trouble? Please tell what country they are from, if it is hard to tell. We have three swarms of bees here now. We have sold two of them. My father has gone to Ashtabula, Ohio. He thinks he will come to see you on the way home.

BRET HOPKINS.

Fort Wayne, Ind., Feb. 28, 1883.

Bees do sometimes sting one in the eyelid; but if, when a bee comes buzzing near the eyes, we are careful to hold up the hand a little before the eye, we can generally avoid letting them get a chance to sting in such a dangerous place.—I will have "Ida" save the foreign envelopes for you, after this.—We shall be glad to see your father; but tell him to show us this letter in the JUVENILE, or we may not remember him.

#### HOW TO GET SPIDER AND FIGWORT PLANTS.

Mamma planted some spider and Simpson seed in a box. Some have their second leaves on. When they get old enough she will transplant them into a paper box. I will tell you how she makes the boxes. She takes two square pieces of newspaper, any size you wish; paste together; then fold two sides toward the center— one side, then the opposite; then fold the ends the same. Cut down the folds of the folded ends to where they are folded over; then take the middle piece of the end; cut and fold the sides over, and paste, and you have a nice box. I send you a sample one half folded. When you wish to plant in the garden, wet the paper and press the dirt around and over it. I think we should have a rather hard time to get the bees here if they should alight on a fir-tree that is 200 feet high and 5 or 6 ft. at the base; don't you? WILLEA ROSE, age 14.

Leland Valley, Wash. Terr., Feb. 11, 1883.

Very well done, Willa. Your ma is quite ingenious. I will explain to our other little friends, that these paper boxes are much like a paper of carpet-tacks after the tacks are used out. I know by experience that these paper boxes are a nice way to fix choice plants so they can be easily transplanted, without setting them back a particle.

## MARY'S FATHER'S ASSISTANT.

My father has 75 swarms of bees, all wintering out of doors, packed in chaff. I have to watch them in swarming time, and have to step lively, when half a dozen swarms come out at once, to wait on pa while he hives them. He sold about a ton of surplus honey. We have had a very hard winter here. The bees have not had a good fly so far. We don't know how they are wintering.

MARY E. WHEATOSS, age 11.

Deposit, Broome Co., N. Y., Feb. 25, 1883.

## HOW IDA SWARMED THE BEES.

Pa has some bees. One day when he was away, one of the colonies swarmed. My brother, who is six years older than I am, tried to hive them; but he got stung, and left them for me to hive. I put on pa's veil, and got them all into three boxes. I covered them up so they could not get out, as I thought. But when I came to look at them they were all in one box. The box was turned upside down, so I put a board under it. Wilfred helped me to carry it into the barn. We left them in the barn until pa came home. I hived another swarm after that. Pa gave me ten cents apiece for hiving them. My sister Fanny has been stung only once all the time we have had the bees. This is the first time I have written for any paper. I hope next time to do better.

IDA SINGLETON, age 13.

Cleveland, O., Feb. 20, 1883.

## A WARNING TO PAPAS.

I will endeavor to tell you how my papa makes candy for his bees, trying to remember the "red lights." And though it may seem to you like the old story of "Cap'n Rice, he gin a treat," I shall have to tell it in my own way. He made the candy of granulated sugar, grape sugar, and wheat flour. He did not have very good success, however; it would not harden, and papa got it all over his hands and trousers. When he touched any thing it reminded me of Aunt Jemima's celebrated plaster — "the more you tried to pull it off, the more 'twould stick the faster." He is now reading the A B C, and thinks he will improve his candy by adding more granulated sugar. Papa bought four colonies of Italian bees in chaff hives, so we now have 30 colonies in good condition.

CLARA E. GRUBB.

Key, Belmont Co., O., Feb. 27, 1883.

Thank you for remembering the "red lights," Clara."

## WHAT A SHEPHERD DOG DID.

A neighbor of ours is a sheep-dealer. He buys sheep around here, and then ships them to Chicago. One night the sheep would not go into the car. He would not have got them in at all, had it not been for his dog. It happened this way: He would carry one or two in, then they would run out again. They kept it up this way until they were tired out. Then just as they were about to give it up, his dog came to his help. Three minutes after the dog came, the sheep were on board. As soon as he got through he went back home. The man lived about two miles across the fields from where he loaded the sheep. All this happened at midnight one day last week.

IRVIN ADKINS, age 14.

Union Mills, Ind., Feb. 23, 1883.

So you see, Irvin, that even a dog has his work in life, and he can do his work even better than a man can do it.

## A JUVENILE LETTER FROM THE COTTON-FIELDS.

Pa found a swarm of bees last summer on a mesquite-tree. Then it swarmed again. We got 70 lbs. of honey in caps on top of the gums. Pa sent for some Simplicity hives. His letter got lost, and came back to him; but he started it again. I have a hive of bees of my own. I picked cotton at \$1.00 a hundred, and made over \$10.00, besides helping pa pick his. He raised 8 bales. To-day is bright and warm, and bees are awful busy bringing in pollen. Where do they get it?

We have a big patch of turnips that stood all winter, and are now in bloom; and this morning, when papa and I were getting "greens," we saw lots of bees on them. May be that is where they get the pollen. Pa copied my letter, and says it is too long. If so, throw it aside. ARTHUR GOODRICH, age 7.

Hanover, Texas, Feb. 24, 1883.

Very good, Arthur. I don't think your letter is too long. We are very glad to hear about the cotton. I think it was the turnips the pollen came from.

## HOW MR. T. LET ONE COLONY STARVE.

Our bees are wintering nicely. Part are buried and part are in cellar. One swarm starved in February, with lots of honey. It was queenless last fall, and pa gave them a small swarm that was in a box, by setting the box on the honey-board. The bees remained in the box, and there were no winter-passages in the combs below, so they could not get at their honey when it was so cold. Pa says we must not let any more starve. We had lots of honey last year. All was sold mostly at one store. It brought 20 cts. per lb. in cigar-boxes; 22 cts. in sections; 15 cts. extracted. W. S. TIMMERMAN.

Fayette, Iowa, Feb. 23, 1883.

Why, W., do you have the bees store honey in cigar-boxes? I should suppose the honey would be flavored with tobacco.

## THE WAY MARY AND HER BROTHER GO TO SCHOOL.

I am a cripple. I can not walk to school, so my brother Willie and I go to school a horseback.

Fayette, Iowa.

MARY L. TIMMERMAN.

That is right, Mary; go to school, even if it is some trouble.

## FROM 12 TO 39, AND 400 LBS. OF HONEY.

Last spring my brother had 12 swarms of bees; they have increased to 39, and he got about 4000 lbs., of which 3000 was extracted, and 1000 comb honey. He uses the Langstroth-hive bottom, and flat top. Some of his bees are in the bee-house, and some are on the ground, covered with straw and chaff. He has a stove in the bee-house, and builds a fire in it in the cold weather, to dry it off. I have got no bees of my own, but I helped him get the honey and extract it.

## THE QUEEN THAT GOT LOST AND FELL IN A PAN.

Last spring the bees would fly out, and I watched them some of the time; but I took a book with me to read, and 8 or 9 queens were lost by swarming when nobody was around. One day when we were extracting we found a queen in a pan near where we were at work. Brother did not know how she got there, but he thought she had got on his clothes and dropped off; but the next thing was to find the hive she belonged in. He then caged her, and placed her in the hive he thought she belonged in.

BURTON HARRINGTON.

Homestead, Ia., Feb. 26, 1883.

## TOMMIE'S BEE-TREE, IN THE DOORYARD.

Pa has commenced taking GLEANINGS, and I see so many little fellows' letters in the JUVENILE that I thought I would tell you about a bee-tree we have in the yard. A man found it in the swamp; it was in a big post-oak tree, and he sold it to my pa. Pa hired two men, and we took the wagon, early one morning last fall and cut the tree down, stopped up the hole with a bunch of moss, sawed the limb off that the bees were in, put it into the wagon, and hauled it home. The limb is about 6 feet long, from 6 to 10 inches in diameter, a little crooked, but the grain twisting. The hole is near the middle, and about as big as my fist. Pa nailed a piece of plank on each end, set it up in the yard, pulled the moss out of the hole, and the way those bees poured out and looked surprised was a wonder! They went to work and seem contented. It is full of comb from top to bottom. Now, what is best to be done with it?

TOMMIE H. MULLIN, age 11.

Oakland, Texas, Jan. 5, 1883.

Just transfer them, Tommie, when apple-trees bloom. If you read "Bee-hunting," and "Transferring," in A B C, you will know all about what to do.

## KIND WORDS FROM OUR CUSTOMERS.

The pruning shears are far better than I could possibly have expected for the money.

Luling, Tex., Jan. 17, 1883.

J. S. TADLOCK.

We received your iron plane and knife and chain with a great exclamation, "How cheap!"

C. P. SANDERS.

Gainsville, Green Co., Ark., Feb. 2, 1883.

The 50-cent smoker is, I think, the best I have ever examined. The 35-cent knife is as good as I can get here for 75 c.

Brandon, Ia., March 7, 1883.

G. D. BLACK.

The foot-power saw is a daisy — nothing but play to cut inch linden. A boy of 14 can do good work. The way the wheel is hung is what does it.

Oakley, Ia., Feb. 23, 1883.

WM. MADONE.

Emma is highly pleased with the books you sent. In less than a week they were read through by four of us. If you were to drop in here, every one would run up to you to shake hands.

Vanceburg, Ky., March 6, 1883.

M. L. WILLIAMS.

Your goods came all right, and are perfectly satisfactory. We are not only pleased, but will continue dealing with you as long as you are so prompt.

Martinsville, W. Va., March 7, 1883.

WM. ST. MARTZ.

Mr. Root, that one pound of bees and queen you sent me I was perfectly satisfied with. You sent them in June, and they have made a hive full of honey.

Westboro, Mass., Jan. 31, 1883.

HENRY D. AINSWORTH.

## THE 50-CENT SMOKERS.

The seven smokers we received give full satisfaction; so does every thing we have from you.

Homestead, Ia., Dec. 22, 1882.

LEONARD HAMMERSCHMIDT.

I was much pleased with the sections I received from you. They more than met my expectations. My honey sold more readily in them than in the boxes.

West Union, Ia., Dec. 17, 1882.

MRS. W. H. SCOTT, JR.

The 10-inch cross-cut saw is at hand, and is splendid. The other articles came too, and are a wonder for the money. I received the first number of GLEANINGS, and like it first rate.

Overton, Pa., Feb. 17, 1883.

G. L. RINEBOLD.

## STAR SAW-SET.

The goods I ordered of you some time since came in first-class order, and all are satisfactory. My brother says he would not take \$2.50 for his Star saw-set, if he could not get another like it.

Bluffton, Ind., Jan. 29, 1883.

D. F. VALENTINE.

I don't find GLEANINGS "flat," as Johnny across the big waters calls flatness; but it is in all points good, and worthy of all acceptance — so much so that every number is worth the year's subscription.

H. B. POMEROY.

Fayette, Fulton Co., O., March 5, 1883.

GLEANINGS, price list, and honey labels have arrived. Thanks for punctuality in sending. The labels are beauties, and all one could desire. We are having a cold winter in Oregon, and I don't know that I shall have any use for labels till I see whether my bees go through all right.

Silverton, Marion Co., Oregon, Feb. 12, 1883.

E. S. BROOKS.

I received the smoker to-day. I did not look for one so large. Please accept thanks for sending so promptly. It was not much trouble for me to stop using tobacco. Your are doing a good thing. I am certain you will be rewarded. I fired mine up, and I tell you it made the smoke boil. In your prayers, think of your humble servant.

Salisbury, N. C., March 2, 1883.

L. R. WEBB.

Halloo, old friend Root! What is the matter? I don't see you these days. It must be the bees have been stinging you. If so, gargling oil is good. Well, this is a sharp winter. We are getting no snow on the ground yet. Raining some to-day; perhaps will wind up with snow. It has been 10° below zero at my place. But bees are all right so far. How are times? I have not made \$5.00 for 3 months. Froze solid.

Quincy, Plumas Co., Cal., Feb. 14 times, 2d month.

D. F. C. HAMBLY.

The last goods ordered came to hand in fine trim. As there were several Christmas gifts for my children in the package, I let them open it, and, sir, it made me feel happy to watch their faces, as one article after another was opened and received with joy. With the A B C my son handed me the "Dzierzon Theory." This made me smile, as I have been wanting it for a long while. Right after supper I sat down to read in it, and enjoyed following Mr. Berlepsch and his assistants all through the little book. They were watching day and night, engaged in earnest study to get at the truth, and at a time when the majority of the bee-keepers were rather against all new theories. I think we are all much indebted to them. To you, friend Root, my best thanks for sending me the little work. I find all the goods very cheap. They could not be bought here for double the money. My A B C sold the next day after it was received. Please send another one.

Sweet Home, Lavaca Co., Tex., Jan. 26, 1883.

AD. MEYER.

The goods you expressed me arrived on the 27th of February in fine condition; also the back numbers of GLEANINGS. I have tried the smoker, and am well pleased with it. It works excellently, and makes as much smoke as an old engine. I have not looked at the clover seed yet, but I know it is nice, and think when my bees see me coming with that little smoker they will not chase me back until I run into the cellar and shut the door after me. The sample of fdn. you sent is very nice. I expect to use it too after a while. I am feeding a few needy colonies, and for feed I make a syrup of cut-loaf sugar, and take 2 lbs. of sugar and dissolve it in a pint of water. Is that the way you would make it? I use the Shuck feeder, and feed at the entrance. Will that kind of feeding promote breeding?

## RYE-FLOUR FEEDING.

I want to feed unbolted rye flour, as a substance for pollen; but the bees don't seem to mind it, nor go near it. Would you tell me how to get them to work on it?

Beatty, West Co., Pa., March 5, 1883.

WM. F. GEIGER.

[Your feed is excellent, but rather expensive, friend G. Just set a pan of rye flour or meal near where they are flying for the syrup, and they will very soon get started on it. After a few are started, you won't have any trouble, only to get meal enough. They won't touch it after pollen comes.]

I have declared unto them thy name, and will declare it.—  
John 17: 26.

ALTHOUGH our boys have hitched the steam-engine to their machinery for making fdn. mills, and are turning them out at the rate of nearly two a day, still we are behind about 25 orders.

A CLERK is now employed to receipt all your orders the day they come; but this receipt does not imply that we have found your prices and orders correct. Very often the errors in prices are not discovered until the goods are ready to ship several days after.

THE call for sample copies has been so great that we have run out twice this year, and are now out again, and our only way is to send those who ask for them, some as far back as 1880. It is too bad, but I don't know how we can help it. All who want "fresh ones" will have to send us 10 cts., or else a whole dollar for a whole year.

I SHALL have to remind our friends again, that it is a penalty to send letters in any package they do not pay letter postage on. To-day we have received four watches, with a letter sent in the box with each one. It would cost you ten dollars each, friends, if we should report you. You have a right to say whom the package is from, but nothing more.

WE have finally secured, we think, all the alsike that will be wanted, and a nice article it is too; but we shall have to charge you 30 cts. per lb., \$4.00 per peck, \$7.75 per half-bushel, or \$15.00 for a whole bushel. You see if we don't raise some alsike "our own selves," after this. We have clerks enough now to give it to you by return mail, express, or freight.

QUITE a good many of the friends are giving me long descriptions of the hives they have, asking what I would advise under the circumstances. With the present crowded state of our business, it is really out of my power to look into these things as I once did; and I am not sure but that if I could, I should advise, in every case, that you get rid of them all as soon as possible, and adopt the regular standard goods. The real honey-raisers are now all going pretty nearly in a beaten path; and if you are out of this path, the sooner you get into it the better; and then the A B C and our price lists will guide you at every step.

THE new maple sugar brought in this season so far has been of a nicer quality than any I ever saw before. The farmers explain it by saying the weather has been so cold there has not been the least tendency in the sap toward souring. We have quite a quantity in little cakes, very white and nice,

that I can furnish you at 3 cts. each, or three cents more for postage, if wanted by mail. We have at present no new sugar in large cakes, that we can sell for less than 13 cts. It is so nice, I have paid 12 for most of it. Last-year's sugar, ordinary quality, we can sell you at 10 cts., or 9 by the barrel. As I have said before, our best sugar always sells first. Nice molasses, *first run*, \$1.00 per can of 3¼ qts.

REMEMBER, friends, that the price of fdn. changed at 12 o'clock at midnight, the 14th day of March. We sent to the postoffice and got the last night's mail, and marked all at old prices; but to-day all orders are to be filled at the advanced figures, according to our notice in Feb. GLEANINGS. One of our wax-dealers writes that dealers are getting wild about the advance on wax. We have secured a plenty for the present, but paid, in one instance, as high as 42 cts. to get it. Until further notice we will pay 35 cts. in cash, or 37 trade, for good fair wax. As I don't know how high it may run yet before the season is over, I would not dare to offer it for less than 42 at present, or 47 for selected wax.

Do you know that I am a great talker? Well, I am; and, what is more, next Monday we are to have in our office, a short-hand writer who thinks she can write about as fast as I ordinarily talk. Of course, she will catch the words with her crooked marks only enough to get the matter down so she can read it; but after that she writes it out in full on a new type-writer of her own. Just think of it, children; instead of this laborious work of trying to scratch down what I would say to you (and I tell you the scratching, a great deal of it, is awful, as our girls can tell you), I shall only have to talk to this little woman, and, lo and behold! the talk comes out presently, nicely printed, and in good grammar. Do you see what education and skill will do?

AFTER very much trial and tribulation our artist has succeeded in getting a very good cabinet-size photo of your humble servant. My wife says it shows the wrinkles of much care and anxiety; but it seems to me it looks a great deal better than I ever did, so I feel very well satisfied with it. Well, I should be very glad to give you one apiece all round; but you see I some way happen to have such a host of friends, if I undertook the job, I am afraid I should not have money enough to build the new factory, just starting. I think we will fix it this way: Every subscriber to GLEANINGS who gets somebody else to subscribe may have one; or if you are too busy to hunt up one, just send us your own subscription for next year.

I SUPPOSE this is a busy world everywhere, and that it is quite a task to take the time to call things by their right names; but, friends, it would save a deal of trouble if you would, in ordering goods, call them by the names we have given them in the price list. Yesterday a man ordered some "pierced covers." What do you suppose it was he wanted? Why, after none of the clerks could tell, I suggested it was perforated zinc honey-boards; and as the price he gave agreed with this, we sent them along. Remember, your order may fall into the hands of some clerk who does not know bees very much, and has only his price list to depend on. If you call things by the same names they are called by in LETTERS LIKE THIS, in the price list, he can turn to them at once, and will know just what you want.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

**\$1.00 Queens.**

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

E. T. LEWIS & CO., TOLEDO, OHIO, Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianian supplies. Send for circular. 1tf

# W. Z. HUTCHINSON

Rogersville, Genesee Co., Mich.,

has made arrangements to receive Italian queens from the South early in the season. The queens will be bred from imported mothers, reared by a thoroughly competent and reliable breeder, and upon arrival, they will be introduced to nuclei until needed in filling orders. These queens will be shipped as soon as it is warm enough in this latitude, probably about May 1st, and they will be used in filling all orders for untested queens until about June 15th, when queens reared in the home apiary will be ready to ship. Before June 1st, untested queens will be \$1.50 each; during June, single queen, \$1.25, or six for \$6.00; after July 1st, single queen, \$1.00; six queens, \$5.50; twelve, \$10.00. Tested queens (reared last season in the home apiary), before June 1st, \$3.00 each; during June, \$2.50 each; after July 1st, \$2.00 each. Safe arrival guaranteed. Make money orders payable at Flint, Mich. 4tf

## IMPORTED QUEENS.

In April, . . . . .	11 francs in Gold.
May and June, . . . . .	10 " " "
July and August, . . . . .	9 " " "
September and August, . . . . .	7 " " "

No orders received for less than 8 queens. Queens which die in transit will be replaced only if sent back in a letter. 1-6d  
CHARLES BIANCONCINI & CO., Bologna, Italy.

## Full Stocks of YELLOW BEES FOR SALE!

WARRANTED NOT EXCELLED.

J. M. MARVIN, 3-5d  
St. Charles, - Kane Co., - Illinois.

ALSO

## BEES FOR SALE IN IOWA.

50 to 75 Colonies choice Italians, from noted pedigree. These will be about as follows:—1 new painted Simplicity hive, worth \$1.00; tested queen, \$2.50; 2 lbs. bees, \$3.00; 10 L. combs with brood and honey, \$3.50. Total, \$10.00. That is in April. In May, \$9.50. June, \$9.00; July, \$8.00. Three-frame nuclei with tested queen, 1 lb. bees, 3 combs, brood and honey, one-half as much as full colony. Safe arrival guaranteed. My 156 colonies are O. K. to date. See new circular. OLIVER FOSTER.

Mt. Vernon, Linn Co., Iowa., Mar. 20, 1883.

# Honey Column.

## CITY MARKETS.

**DETROIT.—Honey.**—The demand for honey is but very slight, and there is a good deal for sale in the commission houses. Light comb honey is quoted at 16@18 cents; but concessions are made to effect sales. Dark honey is not wanted.

**Beeswax.**—Quoted at 26@30 cents, but is very scarce. A. B. WEED.  
Detroit, Mich., Mar. 24, 1883.

**CHICAGO.—Honey.**—The nominal price of extracted is 7@9c here. The supply is abundant, and sales are slow.

**Beeswax** continues scarce. I am paying 30c for good yellow on arrival, and 17@25c for dark and off colors. ALFRED H. NEWMAN.  
Chicago, Ill, March 21, 1883.

**NEW YORK.—Honey.**—Permit us to quote honey and wax as follows.

Best clover, in 1-lb. sections (no glass), per lb., 22@23  
 " " " 2 " (glassed) " " 18@20  
 Fair " " 1 and 2 lb. sections, " " 17@18  
 Best buckwheat, in 1 lb. sections (no glass), " 16@17  
 " " 2 " (glassed) " " 14@15  
 " white clover extracted in small bbls., " 10@11½  
 " buckwheat " " 8@9  
**Beeswax**—prime yellow, per lb., 45c.  
 March 22, 1883. H. K. & F. B. THURBER & CO.

**MILWAUKEE.—Honey.**—The market here is quite dull in both comb and extracted, and slow sales of choice comb in 1-lb. sections, 18 to 19c.; large sections in good order, white, 16c. Broken or bad order, 10 to 15c. Extracted in tin cans, liquid state, and white, 12 to 13c. If candied, put up in pails or cans, 10c. per lb. Dark-colored honey, either comb or extracted, not wanted, and market favors the buyer. The stock is not very large. A. V. BISHOP.  
Milwaukee, Wis., March 21, 1883.

**CLEVELAND.—Honey.**—Honey is a little lower with us, and at the decline has been selling more readily. Sales have been made at 18½ to 19 cts. for best white 1-lb. sections; 2-lbs. not so active, selling at 17 to 18; 2d quality, 17. Extracted very dull at 9 to 11.  
**Beeswax.**—No beeswax in market. A. C. KENDEL.  
 Cleveland, O., March 21, 1883.

**CINCINNATI.**—No particular change in the market for honey and wax. The latter is scarce. The demand is good for extracted honey, with no change in prices. CHAS. F. MUTH.  
 Cincinnati, O., March 22, 1883.

I have about 300 lbs. white-clover honey in spruce kegs and large candy pails, well hooped, painted, and waxed, with covers. I will sell here on board cars for 10c. Packages, \$1.25. N. A. PRUDEN.  
 Ann Arbor, Mich., March 20, 1883.

DOES THE HONEY COLUMN DO ANY GOOD?  
 The six kegs of honey which you noticed in the Honey Column are all sold, and I have had calls for more. Please accept thanks. R. I. BARBER.  
 Bloomington, Ill., March 20, 1883.

**CHOICE ITALIAN QUEENS** from best strains obtainable. Safe arrival guaranteed. References given when desired. For prices, etc. see March GLEANINGS. C. M. GOODSPEED.  
 4d Thorn Hill, Onondaga Co., N. Y.

## BEE-HIVES FOR SALE!

I manufacture every thing needed by bee-keepers, made of wood, not patented. I make Simplicity and Langstroth hives a specialty. My work is as good as the best, and my prices always please my customers. Send postal card for my illustrated catalogue. H. F. SHADBOLT,  
 WINOOSKI, - - SHERBOYGAN CO., - - WISCONSIN.

### Sweet-Clover Seed.

New and clean, 25 cts. per lb.  
 1-4 BEN OLENDENON, Grinnell, Iowa.

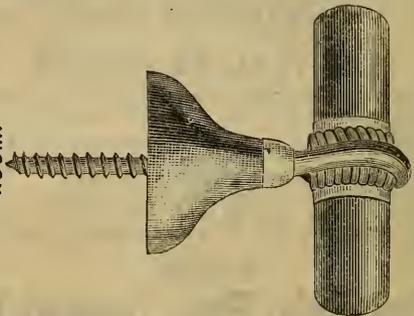

## Recent Additions to the COUNTER STORE. THREE-CENT COUNTER.

Postage	Pr. of 10.	of 100.
4   STOVE-LID LIFTER.....	25	2 25
2   WARDROBE HOOK, same as in 5c counter, but without cone.....	25	2 25
2   PAINT, PASTE, or SASH BRUSH, No. 1.....	25	2 25
2   DRAWER-KNOBS, small, white porcelain.....	20	1 50

## FIVE-CENT COUNTER.

8   TOOTHPICKS, wood; sharp at both ends; a box of 2500 for only 5c.....	48	4 50
2   TOOTHPICKS, quill, a bunch of 18 for 5c.....	40	3 50
6   COMB-CASES, tin, japanned.....	95	8 50

AND AN ORNAMENT TO ANY ROOM.

ONE OF THE HANDIEST THINGS YOU CAN IMAGINE!

3   WARDROBE HOOK or drawer-pull.....	45	4 00
Beautiful finish in jet and nickel		
3   SPICE-SCOOPS.....	45	4 00
5   FRUIT-CAN FILLER.....	48	4 50
This is a large-sized funnel, with a very convenient handle. A very convenient utensil for the purpose.		

## TEN-CENT COUNTER.

2   RUBBER BANDS, ¼ in. wide, doz. bunches.....	85	8 60
10   CARPENTER'S SAWS: nice for the boys, and handy for little work.....	85	7 50
18   PAIL, with cover, 4-quart.....	98	9 50
These are made for oyster-pails, but will answer nicely for honey. The cover slips over after the fashion of the Dadant honey-pail.		
9   HORSE-RADISH - GRATERS. Large, and strongly made.....	75	6 50

## FIFTEEN-CENT COUNTER.

5   PAPER DUSTER or FLY BRUSH, made of colored tissue paper.....	1 35	13 00
--	------	-------

## Twenty-Five Cent Counter.

25   DISH-PAN, one solid piece of metal....	2 25	20 00
Retinned, made exactly like the dipper as described below. Beautiful piece of work for the money. Holds 6 quarts.		
16   DIPPER, very large size, retinned.....	2 00	18 00
This is made with strong riveted handle, suitable for dipping honey and maple syrup, and it will be found an extremely useful utensil on washing-days. As the whole is dipped in melted tin after it is finished, it has a bright silvery look, and might call forth admiration from any housewife. Holds 2 quarts.		

## Thirty-Five Cent Counter.

40   STRAINER PAIL, 8 qt. Nicely made....	3 25	30 00
2   KNIVES FOR LADIES.....	3 25	31 00
These are made of the best razor-steel, hand-forged, and finished in best style. We have three patterns. First, Ivory handle, German-silver tips; second, Black horn handle, German-silver blades; third, like the last, only longer, and with 2 long slender blades. Specially adapted to cutting out queen-cells, and we term it our "queen-cell" knife.		

## FIFTY-CENT COUNTER.

14   LADIES' RUBBERS.....	4 50	42 50
Light, but nice to keep one's feet clean. We have sizes from 3 to 7. Number 6 is exactly what I use when I run out in the mud.		
Strainer pail.....	4 75	45 00
9   Clothes-brushes.....	4 00	37 50
All bristles, and well made.		
40   Dinner-pails, oblong, square.....		
Contains a can for coffee, tray for pie, etc., and drinking-cup. Very convenient.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. N., 42c per year extra.

**NOTES FROM THE BANNER APIARY.**

NO. 41.

CONTINUED FROM LAST MONTH.

**M**R. ROBERTSON went with me on my journey as far as Ionia. Here I spent two hours in visiting the State House of Correction. The afternoon train was three hours late, and it was eight o'clock in the evening when I arrived in Lansing. The legislature was in session, and the great Capitol building, with a flood of light streaming from its many windows, made a beautiful picture with the blackness of night for a background. But I was too tired for sight-seeing, and sought the spring bed of the hotel. With the Newhall-House horror fresh in my mind, I was thankful that I was given a room on the first floor.

The next morning I trudged the four miles out to the Agricultural College farm, only to find Prof. Cook away from home. Not knowing positively when he would be at home, I took the next train for Battle Creek, and was soon seated by a cozy fireside, and having a pleasant chat with B. Salisbury and wife. Friend S. does not keep bees so extensively as many bee-keepers, he also being engaged in the manufacture and sale of health-reform garments for ladies; but he has all of the modern improvements, and raises extracted honey, which he retails at 15 cts. per pound. He thinks this pays him better than raising comb honey. He uses the Langstroth frame and chaff hives.

It is probably well known that the Seventh-Day Adventists have their headquarters at Battle Creek;

and although not connected with bee-keeping, two of the pleasantest hours spent while on my trip were those in which, with friend S. for a guide and companion, I visited their publishing house, tabernacle, and sanitarium. We first went to the publishing house, where may be found an improved engine, improved presses, paper-cutting machines, machines for ruling paper, arrangements for marbling and gilding the edges of books, electrotyping and stereotyping departments, and editorial room with its well-arranged book-cases and desks; in fact, the building contains the thousand and one wonderful machines and processes to be found in a large printing and publishing house, all of which need to be seen to be understood and appreciated. The sanitarium is a large brick building, four or five stories high, heated by steam, lighted by gas, and furnished with almost every known appliance for the treatment of diseases. A visit to the different departments of this institution, to its bath-rooms, dining-rooms, laboratory, etc., almost made me wish that I were sick, "just a little," so that I might have an excuse for indulging in all these luxuries.

From Battle Creek I went to Dowagiac, where I was warmly welcomed by James Heddon and family. Friend H. has 500 colonies, which is probably a larger number than is owned by any other bee-keeper in the State. Having commenced keeping bees 14 years ago, and having made a specialty of the business, and given it his best thoughts, it is not to be wondered that he stands in the front rank of Michigan's bee-keepers. There was scarcely a topic that came up for discussion, during our three days' visit, in which he was not perfectly at home — he had

"been there," and could tell all about how it turned out. During the past two seasons he has had with him a small class of students learning bee-keeping, and he is making arrangements to accommodate a still larger class the coming season. Fortunate indeed will be the young man who wishes to make a profession of apiculture, if he can pass one season in the apiary under the instructions of friend H.

THE L. FRAME, AGAIN.

Friend H. uses the Langstroth frame, and gives the following reasons for his preference: The shallowness of the brood-nest induces the bees to enter the boxes more readily; there is more room for boxes over the frames, and they are used by the majority of bee-keepers. Were I starting an apiary, I should certainly adopt the L. frame; and as it is, I am thinking quite seriously of laying aside my American frames for the L. I shall certainly give the L. frame a trial the coming season.

A STRONG ITEM IN FAVOR OF ½-LB. SECTIONS.

Friend H. will use the half-pound section quite extensively the coming season. He says there is certainly one good point in their favor; and that is, they can be shipped almost anywhere by freight, with but little danger of injury.

From Dowagiac I went back to Lansing, where I not only found Prof. Cook at home, but confined to the house by a rheumatic attack. Prof. C. was busy reading the "proof" of the revised edition of his "Manual of the Apiary," which he has entirely rewritten during the past winter, adding much new matter, many new engravings, and somewhat enlarging the work. The first edition will be out some time in March, and will be impatiently waited for and eagerly read by the professor's numerous bee-keeping friends. Prof. Cook uses and advocates the Gallup frame, as he considers it the best shape for rapid handling, and for allowing the bees to cluster in a compact form.

Through the kindness of Mr. Babcock, a young man who came over from England to learn bee-keeping, but finally decided to take a full course at the college, I was shown the college apiary, or, rather, the evergreens that shade the hives in summer, for the bees were in the cellar. He also went with me to Prof. Cook's study, where a fine microscope, and some mounted objects showing different parts of a bee, so charmed me that it was with difficulty that I tore myself away long enough to visit the museum of stuffed birds, beasts, and reptiles, of bugs and butterflies, of skeletons, and of the thousands of interesting objects that lack of space forbids mention. After spending one night and one day under the roof that shelters the happy Cook family, I took the evening train for Flint.

Early the next morning I called upon August Koeppen, a German who keeps a small apiary. Not only the walls of the hives, but the bottom-boards, are made double, and filled with tow. I was interested in examining a large home-made extractor, capable of receiving six combs; an automatic arrangement can be used for turning the combs inside the can.

From Mr. Koeppen's I went to Mr. M. S. West's. Like some other very successful bee-keepers, friend W. never writes for the bee-papers, and does but little talking; but, as friend Heddon expresses it, he is one of those who "get there." He uses both L. and Gallup frames, and raises comb honey.

BEE-KEEPING FOR WOMEN.

Last June Mr. West was taken sick with typhoid

fever; but so conversant was his daughter with his business that she not only cared for the bees, something toward 100 colonies, all through the swarming season, but she successfully carried on his local supply trade. Tally one more for the ladies.

A PROFITABLE KIND OF CONVENTION.

Brother bee-keepers, if you can, go and visit the most successful bee-keepers that you know, and you will never regret it. For the purpose of gaining practical information, these "conventions of two," if the right persons are chosen, are better than the hurly-burly of a convention 100 strong.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., Feb. 17, 1883.

### SWARMING IN LARGE APIARIES.

The Easiest and Most Expeditious Way of Caring for the Swarms.

OUR FRIEND CYULA TELLS US OF SOME OF THE TROUBLES THAT BESET BEE-KEEPER-"ESSES."

MRS. HARRISON will please accept thanks for her kind and explicit answer to the question I took the liberty of putting in Feb. GLEANINGS. I am sure that more than one of our bee-keeping sisterhood will be helped, and that all will have shared my own keen interest in this glimpse of Mrs. Harrison's management.

Mrs. Harrison's dish-pan may not be quite as convenient as the light willow baskets, lined with burlap, and provided with a cover of the same, which are used by Mr. Heddon; but the former article has the advantage of being already within the reach of every bee-keeping woman. I would suggest, however, that Mrs. H. probably used her pan with the addition of a cloth lining; as otherwise, on a bright hot day, it would become so heated by a few moments' exposure to the sun that her bees—if like our bees—would boil over and out of the pan too quickly to be easily carried many steps.

For swarms so considerate as to cluster where they can be easily shaken down and into some convenient receptacle, Mrs. Harrison's plan will work admirably; but for a swarm spread over the shaded side of a stump, or a swarm weighing down asparagus-stalks or pea-vines until, before the cluster is formed, a goodly portion of the bees are spread upon the ground, and inextricably mixed up at the base of the stems which one is forbidden to pull up, for such a swarm I think I should prefer a light hive, with shaded entrance invitingly wide, and the use of a little strategy to induce the bees to go in and take possession, of their own free will. I think I should prefer this, even if I were obliged to carry the hive to the bees alone.

In the early days of our bee-keeping, Nellie and I supposed that the well-informed bee-keeper—"ess" always divided her colonies instead of allowing them to swarm; and for three summers our practice conformed to this theory, with exceptions when the bees did not happen to agree with us. By the fourth summer we had decided to make natural swarming the rule, and dividing the exception; a decision to which we have since adhered. From the first we have practiced clipping our queens' wings, although each season there has been, for one reason and another, a few exceptions. For some time we caught our returning swarms in a new hive on the old

stand, and carried the old hive to a new stand. Our hives were not as large and heavy in those days as now, nor did we have as many colonies; so that Nellie and I together were able to manage it, but with much difficulty, sometimes, it must be confessed.

When I read the letter of the sister who so emphatically pronounced bee-keeping too hard work for women, I inferred, from what she said relative to moving hives heavy with honey, that she had been making the same mistake which was being made in our apiary seven years ago. For to change the place of the old hive was a serious mistake—and that quite apart from the question of more or less hard work.

Removed to a new stand, the brood-combs in the old hive are often left quite too bare, in case the day be succeeded by a chilly night. I believe, too, that there may be truth in the suggestion, once made to us by an experienced bee-keeper who had noticed the mysterious disappearance of uncapped brood in such cases, viz., that the too scanty guard, unequal to the task of caring for all, adjust their duties to their powers, and compassionately (?) save the younger larvæ from being chilled or starved, by devouring them alive. If the old hive be left on its stand, bees returning from the field, and strays from the swarm, will keep the remainder safe.

I do not think we have made the mistake of moving the old hive to a new stand for the past six years. While our regular practice with respect to hiving swarms during this time has been as given in Feb. GLEANINGS, we have had a deal of *irregular* practice thrown in. Nellie once cut a sturdy little beech-tree nearly through with a hand-saw while an enormous swarm quivered and swung about her head, threatening to drop with every jerk caused by the pinching of the saw in her unskilled hands. And then, together with the help of a rope, we managed to bend the tree till the swarm was safely shaken off. We have taken dozens of swarms from stumps; we have gathered them from rail fences, and shaken them from cherry and pear trees. I hesitate to say, but it is the simple truth, Mr. Editor, that I once caught a swarm which came out just before the beginning of a light summer shower, under an umbrella. (There! I meant to have saved that story to tell your little folks in JUVENILE.) We lost two swarms last season; in each case, of course, because the queen had wings. One settled in the top of a tall hemlock, and two men from the field, with Nellie to superintend, spent half the forenoon in a vain attempt to secure them. The other swarm also went to the edge of the woods and clustered beyond reach on the body of a tree. It was necessary that a staging of some kind be provided, and Richard was petitioned to carry over a barrel, let down the fence, and clear away the under-brush, so that Nellie and I could secure the bees. But dinner was ready, and Richard — just from the hay-field, tired and hungry — thought the bees might wait upon his pleasure a little; and, of course, the bees did not wait.

One memorable day last summer we had eleven swarms — the most swarming we have ever had in one day. Two of the eleven had queens with wings, and these two swarms gave us more trouble and more hard work than all the rest put together.

Although we prefer to catch our swarms on the old stand, still a swarm showing a disposition to cluster in an exceptionally favorable spot is in no danger of being refused the privilege. We give them their queen, and hive them where they hap-

pen to be. But we get through more quickly, which sometimes saves strength by giving time for a little rest, if the swarm returns without clustering. Mrs. Harrison says that our way may be as easy as any where there are two to do the lifting, but certainly not where there is only one. I do not claim that it is. I am very sure that for women of less than average strength, and especially for women who, like one I know of, are about engaging in the business with the hope of thereby regaining health and strength, there ought to be a far better way. But this better way would not be for me, even if working alone, that described by Mrs. Harrison. With our surroundings, it would not do unless our bees were more habitually considerate than they have hitherto shown themselves to be. And there may be others, similarly situated, whose experience has led to the same conclusion. But if the Brooks swarm-catcher will do what was claimed for it when first introduced to notice in GLEANINGS, why may not the advantages of both methods be combined by the woman who works alone? She can avoid lifting hives, as Mrs. Harrison does, and she can avoid the trouble which in a location like ours would inevitably result from leaving her queens' wings unclipped.

But, does the swarm-catcher do what was claimed for it? If any sister has tried it, will she please give her experience? The objection which has occurred to me is this: That the appearance of the old hive must be so changed that the tendency to enter adjoining hives, sometimes manifest on the part of a returning swarm, will be greatly increased. We have always found it easy to guard against this tendency; but I have feared that, with the swarm-catcher, it might become a more serious difficulty. If any sister has a better way of managing, will she please give us her method?

It is a practical and serious question with me; for though Nellie has relented so far as to say that I may keep ten colonies, she gives me no promise of assistance. Nellie reminds me that Mrs. Harrison's special advice to us calls for a little personal explanation on our part. But that must wait for another time. I will here only express my thanks for the good feeling and kindly interest which, I am sure, dictated it.

CYULA LINSWIK.

March 20, 1883.

And many thanks to you, good friend Cyula, for so fully explaining to us the difficulties that lie in the way of bee-keeping for women. Your location is a little different from that of most of us, for we have no tall trees within almost a quarter of a mile of our apiary, and there are, in fact, few trees of any kind, except small evergreens. I often think of you and your forest home, and I have thought, too, I should dearly love to pay you another visit, but am afraid I never shall, if you give up the bees. I am very glad indeed to hear that sister Nellie has relented so much. In behalf of the brothers and sisters, I tender her my best thanks, and methinks I can see now that peculiar smile of hers that I just caught a few glimpses of during the brief hour of my visit. By all means, give the juveniles that story, and tell it very plainly, too, just as you know children like to have stories told. With the children of to-day lies the future of our country, and we don't want them all to leave the country and go into the cities.

## MRS. HARRISON TALKS TO US ABOUT FEVERS,

AND GIVES US SOME WHOLESOME ADVICE.

**F**RIEND SMITH, can you not get along without quinine in Georgia? My remedy for "an ordinary fever" would be a pack. Spread two comforts and a blanket on a lounge, and then wring out of hot water a sheet, or, better, a woolen blanket, and spread it on. It is well to give the fever patient some hot herb-tea, sage or pennyroyal, and then wrap him up in the hot sheet, raising the arms and putting one half of the sheet over the body, and then putting them down and drawing the other half over. The blankets and comforts should be drawn tightly and tucked in snugly, especially around the neck and shoulders. A hot soap-stone should be placed at the feet, and a cool cloth at the head. The work should be done quickly and well, so that the patient will be warm and comfortable. Let the patient remain half an hour, or longer, if sleeping, and then unwrap and wash off in a tub of tepid water, wiping dry, and going to bed. My husband says he is "in heaven" while in a pack.

I have had the "bee-fever," several very violent attacks, followed by *chills*. Out under that catalpa-tree in our yard is a remedy. It is a vicious colony of hybrids, and very likely the queen visited a drone of the Cyprian persuasion, belonging to a neighboring apiary. Trespass on that queen's domains, and the temperature of bee-fever falls immediately. It is wonderful, what a powerful antidote it is.

The weather here at the North is also a wonderful antidote. The winter of 1880-'81 cured more persons that were badly afflicted with it than any thing I ever heard of. The honey-market, too, is a *cooler*. I have sometimes thought that it was the most powerful known remedy, where the market was overstocked, and sales dull and slow. If none of these things break the fever, let it run its course. Like all other fevers it will wear itself (or the patient) out.

Mrs. L. HARRISON.

Peoria, Ill., March, 1883.

## THE WAY FRIEND PETTIT FILLS HONEY-PACKS.

ALSO SOME GENERAL HINTS IN HANDLING EXTRACTED HONEY.

**O**N page 82 you ask about filling honey on our circular table. I fear the answer will be too long, and cover too much ground. When first extracted, my honey is thrown into large tin tanks that will hold about 1000 lbs. of honey each; these are covered with cheese-cloth, and allowed to stand some time before the honey is filled into cans, etc., for market. I now place a 30-gallon milk-can, such as dairymen use for sending their milk to the factory, beside one of these storage tanks, and with a tin dipper\* (after thoroughly stirring the honey to make it all alike) I proceed to fill the milk-can. I place a tin with raised sides and drooping ends over the tops or edges of these cans, to prevent the honey dropping between the cans. The milk-can

\* The dipper is made of heavy tin. It is  $4\frac{1}{2}$  inches deep; diameter of bottom, 6 in.; diameter of top, 9 in. Handle is 3 ft. long and  $1\frac{1}{2}$  inches in diameter. A suitable hook is soldered on the under side of the lower end of the handle about 4 inches from the bowl of dipper, so that when the dipper is not in use it can be hooked upon the top and inside of the honey-tank.

should stand on a low truck, on which it is moved to the circular table, and is then raised to the desired height by means of rope and pulleys, and is then lowered upon a box of suitable size.

Now, friend Root, imagine yourself placed upon a chair, with your left side toward the table, and the milk-can right in front of you. Now fancy you hold a Jones honey-pail in your left hand under the honey-gate in the milk-can, while you open the gate with the other, and you have a vivid picture how we do it in our honey-house. If this letter be read in connection with one cited on p. 82, I think all will be clear. Honey ranges itself, so to speak, into layers according to density; and, therefore, to have the packages all alike, it should be well stirred immediately before being filled into packages.

S. T. PETTIT.

Belmont, Ont., Can., March 14, 1883.

## A HOME-MADE HAND-POWER BUZZ-SAW.

THE WAY FRIEND DIMMICK GETS HIS POWER.

**N**OTICE that considerable is said in GLEANINGS in regard to hand-power buzz-saws for making hives and their appurtenances, discussing the different modes of construction, expense, etc. I have one of my own construction and make, which I have used for 12 years; and although quite inexpensive, it has answered my purpose admirably. Of course, I would not recommend it to those who make a business of making hives, sections, etc., to sell; but for individual use, I think it comes the nearest filling the bill of any thing of the kind I have seen or read of yet; at all events, I will venture to give your readers a brief description of its construction. I presume some will think they would prefer something more complicated and expensive. All such will have the privilege of improving upon it, or devising something better; and if they should succeed to any great extent (taking all things into consideration), be assured I shall be one of the first to adopt the improvement.

Now, in regard to its construction: I first make a wheel 6 feet in diameter by halving together in the center a couple of  $2\frac{1}{2} \times 3\frac{1}{2}$ -in. hard-wood scantling, 6 feet long, making 4 arms to support the rim; cut a  $1 \times 3$ -inch tenon on end of each arm to fit the rim to; for the rim, cut out basswood felloes (with scroll saw), one inch thick and 3 inches wide; length, 1-12 the circumference of the wheel. I used 4 courses of these felloes, alternately lapping the joints of each course, and fitting them to the tenons of the arms, and nailing the 4 thicknesses firmly together, thereby making a rim 4 inches wide and 3 inches deep. For shaft to wheel, I used 1-inch iron with collars and nut, and fitted at each end to receive a crank, the same as is used for grindstones; hung the wheel to a couple of  $3 \times 4$ -inch scanting, set upright and parallel; fastened securely at top and bottom.

Second, I made an adjustable saw-table to my own liking, very much like the one described in A B C; fastened to table a belt-tightening pulley with lever attachment; set table about 5 or 6 feet from wheel, running a 2-inch belt direct from wheel to pulley on saw-mandrel, which is  $2\frac{1}{2}$  inches in diameter, and here you have the whole thing complete.

To do a short job of two or three hours' work, one man or boy will turn it easily, but for a good strong day's work, it is better to have two to turn. Boys

make the hives, I could have had ten more swarms. I had to double them up a good deal to get them into the hives that I had, and I also lost several swarms that went to the woods. By their swarming so much I got very little honey; but I am not a bit discouraged, for the increase will more than twice pay me for my little bother with them, and it is quite a pleasure to me to work with the little fellows, even if they do use their stings on me once in a while.

SETTING THE CHILDREN AT WORK.

I received those saws and the mandrel, and I am well pleased with them. I have got my rig fixed up to run by horse-power, and it is almost play for me and the boys to cut up lumber for hives. I have six boys and three girls, and I feel that there is a good deal of responsibility resting on me to lead those little ones, with whom God has blest me, in the right direction. My oldest child is 16, and he has already embarked on the old ship of Zion. Friend Root, I feel bound, by the assistance of the good Being, to set a good example before them, that they, too, with me, may meet their mother who has passed on before us. Oh what comfort it is, when we have to part with loved ones here, to think that, if we are only faithful, we shall again meet where Jesus is, never to part again!

D. P. HUBBARD.

Graysville, Monroe Co., O., March 5, 1883.

OUR OLD FRIEND I. R. GOOD.

WHAT HAPPENED, WHAT HE DID, AND WHERE HE IS NOW.

**A**BOUT the first of March we got a letter from friend G., and it read something like this:—

I have lost about 100 colonies of bees; every one that I used for queen-rearing last season is dead. My hopes are not blasted, but I am thinking very strongly of emigrating to Tennessee or Alabama.

Napanee, Ind., March 6, 1883. I. R. GOOD.

In reply to the above, I wrote as below:—

Don't do it, friend G. You haven't got fairly initiated yet.

To which he replied:—

You say I haven't got initiated yet. How many degrees are there in bee-keeping? I have taken several degrees; but if there are as many as there are in Masonry, then I will acknowledge that I am on one of the lowest rounds of the ladder. I purchased a colony of bees with the first \$4.00 I ever owned. I start for Tennessee and Alabama this week; am going to see the Sunny South.

Napanee, Ind., March 11, 1883. I. R. GOOD.

And now we get this from him to-day:—

I wish you were here with me for a little while to enjoy the scenery here. Coming up this mountain is as a Christian's journey should be—a continual going-up until the eternal city is reached. I like Tennessee, what I have seen of it, so far, and like its people. Peaches are out in bloom, and every thing looks lovely. I can see J. H. Thornburn's apiary, about 1000 feet below. I am going down to see him.

I. R. GOOD.

Roper's Rock, Lookout Mt., Tenn., March 15, 1883.

That is right, old friend. You just keep on sending us notes of travel like the above, and we shall soon have you for a special correspondent; and who knows but that

some day we may be able to pay you as much for it as all the bees you have lost are worth? May God be with you in all your journeyings, and may they ever be onward and upward, toward the eternal city.

“INASMUCH AS YE HAVE DONE IT UNTO THE LEAST OF ONE OF THESE, YE HAVE DONE IT UNTO ME.”

MRS. HARRISON PLEADS FOR THE HOMELESS CHILDREN.

**A**LTHOUGH you have started out a little in that direction.” How many, many times I've revolved those words over and over again in my mind, since the receipt of the last GLEANINGS! I started over twenty years ago, and never looked back long at a time. I've no desire to parade my domestic affairs before the public, but will put in a word, since that remark in GLEANINGS, “Started a little.”

We've had six protégés in our family, and half of them are in good homes, and have families of their own. I have found homes for seventeen poor children, most of them in the country, and I now have in my closet, clothing that I have repaired to dress a boy comfortably to take him with me to a home in the country next week. Last Sabbath, as I took this boy's starved, thin hand in mine, there were very queer sensations running up and down my spinal column. I am very sorry to say it, but the boys have done better, as a class, than the girls. Some of them did not remain very long, but yet they were made better by it, for it is impossible for a child who has never known what a good home is, to remain in one six months or a year, and not be benefited by it. Three boys for whom we got places in the country several years ago, and who, while here, were the terror of the neighborhood, playing truant, throwing stones at street-lamps, robbing vineyards, etc., are now well behaved when they visit the city, and are well liked where they live in the country.

Work is one of the very best reformatory measures; nothing is equal to it under the sun. If our lady bee-keepers can not obtain girls as helpers, why not try boys? In a city it is easier to obtain a home for a girl than a boy. It does not hurt a boy a particle to do housework, or lower his manliness either. The city bakers and confectioners are all men.

Peoria, Ill., March, 1883. MRS. L. HARRISON.

FROM 23 TO 50, AND 4000 LBS. HONEY.

A HEAVY TESTIMONIAL IN FAVOR OF FEEDING THROUGH A DEARTH, AND EXTRACTING THROUGH A FLOOD OF HONEY.

**T**HEREWITH send in my report for 1882, although rather late. I commenced the season with 23 swarms; 7 of them were mere nuclei; the rest were fair average swarms, all in Simplicity hives. I increased to 50 by artificial and natural swarming, and took 4000 lbs. of honey—3500 extracted, and 500 comb honey, with an average of 30 or 35 lbs. to the hive, for winter stores.

The honey season began very late; cold and wet until the first of July; fed up to July 10th. At that time I do not think there was half a pound of feed in any of the hives.

Basswood bloom opened on the 12th and continued about two weeks, when there was a lull for a few days, and then came the greatest flood of honey I ever saw. This was from honey-dew and fall flowers, lasting till Sept. 12, when the season closed. So you see my crop was all stored in about six days. We had made preparations for taking mostly comb honey; but when the rush came we were obliged to run the extractor constantly, to give room for the queens, as the bees would fill cells with honey that had eggs and larvae in them. I expect to hear of widespread disaster where the extractor was not used, as they have gone into winter with principally all old bees; and already the reports of losses begin to come. One man reports 6 swarms all dead — all he had; another has lost 7, and several others have lost heavily.

I have so far lost but one swarm, and that one we had extracted from late, and their stores were too much scattered in the hive. I put 12 swarms in cellar, 88 on summer stands, and covered with snow for 80 days. It has been pleasant for several days, and the bees have had a good time, and are now in good trim for the storms of spring. WM. C. HUMPHREY.

Redfield, Ia., March 3, 1883.

## CYPRIAN AND HOLY-LAND BEES.

### HOW THEY DO FOR ME.

**I**N the summer or fall of 1881 I bought of H. Alley two Cyprian queens, both tested. They bred up in the fall to good strong colonies, and for some reason or other both colonies superseded their queens and raised young queens. The young queens mated with Italian drones, there being no others in my apiary. I could not distinguish Cyprs from the Italians. I looked for them to be crosser than the Italians, but was happily disappointed. I could see no difference as to their honey-gathering qualities, doing just as well as my Italians. If any difference in color, the Cyprs are the yellower.

In the fall of 1881 I bought of H. B. Harrington a tested Holy-Land queen. He wrote me that she was a very fine one. In a short time she had her hive full of brood. I was fortunate enough to rear two queens the same fall from the Harrington queen, the young queens mating with Italian drones. So in the summer of 1882 I had a fair chance to test these colonies with my Italians. In the spring they bred up so fast that I concluded to rear a number of half-blood Holy-Land queens. The old stock of the Harrington queen is cross, if you undertake to handle them with smoke. I had built them up to four brood-chambers on top of each other by using fdn. as fast as the bees and queen could use it; and, wonderful to report, in a short time the four chambers were full from top to bottom. I intended to use the extractor, thinking that they could be handled with smoke, like my Italians; but the more I smoked them the more they would boil out of the top of the hive. I made out to take some two gallons of honey from them, or about 22 lbs. I then concluded that they were too cross to be run for extracted honey, and so I divided them up into four colonies, making the queenless ones raise queens, which they did.

I had no trouble with fertile workers. With care the old stock can be handled without smoke or protection, without danger of being stung. The half-

bloods are no crosser than Italians, and are great honey-gatherers, as good, or better, than my best Italian colonies. In fact, they look and act like Italians. The Harrington queen's stock are more grayish, rather smaller, quicker in going out, and slow in nearing the hive. Any one can tell the Holy-Land bees from the half-bloods and Italians.

I am much pleased with the cross of the Holy-Land and Italian bees, and will establish or start an apiary of them away from my home apiary, to keep from further crossing with my Italians.

LEONIDAS CARSON.

Frederick, Ohio, March 20, 1883.

## DO QUEENLESS COLONIES KILL THEIR DRONES?

ALSO AN EXCELLENT MORAL ON THE IMPORTANCE OF FEEDING THROUGH A BAD SEASON.

**U**NDER the above heading Mr. J. E. Pond, Jr., in your Nov. No., 1882, page 560, says: "Did you ever know a queenless colony to kill off its drones before accepting a new queen?" and describes a case of that kind that happened in his own apiary. You, friend Root, in answer say you "never noticed a case of the kind," leaving it to be inferred that such a state of things is rather unusual.

Now, my experience during the past season is similar to that of friend Pond's, and goes far to prove that queenless colonies may often kill off drones. In the spring of 1882 I had 26 colonies, and I never saw bees stronger, or in better shape, than they were in April last. The spring proved very cold, and the season consequently was backward, and my bees diminished in numbers rather than increased as they ought, and not till June did they begin to gain at all. They gained but slowly during the white-clover bloom, but did not store a single pound of surplus. The basswood season came and went without knowledge on my part, so far as any yield of honey was concerned. After basswood, comes our usual season of dearth; and my bees were left with hardly stores enough to give them a bare subsistence. Not a colony of the 26 even made preparations for swarming, except raising a few drones, and not a queen-cell was built by any of them except when the bees took it into their heads to supersede a queen, which quite a number did do without any apparent cause, the superseded queens being extra good ones, young and prolific.

The bees in the whole apiary seemed perfectly demoralized, and utterly disheartened. Killing off drones was the order of the day, and looked as though they were trying to make a pastime of it. Queenless colonies were fully as much disposed to kill their drones as any of them; and if you, friend Root, had been there at that time, I could have shown you a dozen queenless artificial swarms just made by dividing, that were as busily engaged in killing drones as those that had queens. Two colonies that had superseded their queens, and had queen-cells capped, were just as crazy as the rest, and I was compelled to feed regularly in order to stop the slaughter, and succeeded in so doing only after feeding several days, as the bees had nothing else to do (there being no nectar in the fields) to amuse themselves, they occupied their time in cutting fdn. out of frames, and holes through the quilts, and it was with great difficulty that I finally induced

them to quit that (to me) very unpleasant occupation. I was expecting from day to day that they would gather enough to live on, if not more, from the fields, and so neglected feeding as I ought; but in the future I can assure you I shall not be caught so again, but shall feed right straight through a season of dearth, and thus be on the safe side.

Now, in the matter of killing drones I am sure, in my own case, the cause was the bees being completely demoralized by the honey-dearth. The past season was the poorest we have ever had here in Maine, and I hope we may never have another such.

JAMES B. MASON.

Mechanic Falls, Me., March, 1883.

Thank you, friend M. Since you mention it, I have seen a similar case, when a whole apiary was thus demoralized by a prolonged dearth of honey. I, too, am resolved to feed hereafter, always, when the bees can fly, and no honey is to be had. The great yields that have been reported from apiaries fed through the dearth of last season, ought to satisfy us all of the great importance of feeding when it is needed.

### FOUL BROOD IN GERMANY.

ALSO SOMETHING ABOUT FOUL BROOD IN OUR OWN COUNTRY.

ONE of my German papers brings me the following, which may be of interest to you: The German Reichstag has enacted a law which is to be enforced on and from July 1, 1883, inflicting a fine of 100 marks (\$25.00), or imprisonment for one month, on any one who (1) gives away or sells colonies, hives, frames, or combs, infected with foul brood; (2) who exposes knowingly, on his stand or elsewhere, infected colonies, hives, frames, or combs; (3) who does not remove out of reach of bees, or disinfect completely all such infected hives, frames, or combs, on discovery.

France, Italy, and Germany have had for years their severe trials and disappointments with foul brood. From there it spread to our country. They always had industrious and intelligent bee-keepers as well as able scientists to discover the nature of the disease, and to apply curative remedies. They differ materially with our friend Jones, who thinks the starving process a sufficient remedy.

#### A PROPOSED TEST EXPERIMENT.

You will please keep Prof. Cook reminded that I shall send him a colony of bees infected with foul brood as early in spring as I can get my stands strong. If I have no foul brood myself, I shall know where to get it, and infect a colony. You will remember that Prof. Cook agreed, at our Cincinnati Convention, to cure a colony of foul brood by the starving process, if he can, under directions of our friend Jones. The wager of \$50.00 between brother Jones and me has a twofold benefit, as it will advance science, and be added to the Langstroth fund. We could intrust the matter to no fairer nor better hands than those of Mr. Cook.

If our German brethren are correct, it is clear that Mr. Bingham knew nothing about foul brood when he explained that only by the introduction of worker bees, and not by that of the queen, we could introduce foul brood.

CHAS. F. MUTH.

Cincinnati, O., March 19, 1883.

### A COUPLE OF BEE - MEN IN TROUBLE.

DO THEY BELONG IN BLASTED HOPES?

IF I FIND, on looking over last GLEANINGS, that the column for Blasted Hopes looks neglected. Now, I have enough interest left in GLEANINGS to wish to see all its various departments in a flourishing condition. I never expected to be in Blasted Hopes, but here I am.

I began bee-keeping some six or seven years ago with about a quart of bees for a start. My progress was slow for some time; but when I saw the first copy of GLEANINGS I got the bee-fever, and I pushed matters pertaining to bee culture accordingly. I now have forty colonies, and have always labored to make my bees pay as I went along, in honey and not in increase of swarms. My success in wintering has been good, having never lost a swarm. But on the 2d day of March of the present year my fever burned out and left me shivering. Neighbor Thompson, a brother bee-keeper, and myself went on said day for a load of lumber for hives. The recent thaw had made the roads somewhat muddy, and we each put a team on the wagon so as to haul a good load. All went well till, on our way home, about dusk we arrived at Bureau Creek bridge, a structure 240 ft. long, in three spans. The stream was much swollen from the melting ice and snow, and resembled an angry flood, roaring and tearing under the bridge and over the banks below. As we were crossing I said to Thompson, "What a good thing it is to have a good bridge like this, for no one could cross such a stream as that without."

I had hardly said this when the middle span on which we were gave way, and we with our four horses and wagonload of lumber went crashing down into the boiling and rushing torrent below. Friend T. was thrown upon the horses, but managed to scramble back on the load, which was buoyed up by the water. I was thrown into the water, and went down, down; but by vigorous paddling I reached the top. T., who had the whip, held the lash out to me, and as I took hold of it he drew me to the lumber, and I climbed upon it. We now floated down the current, and that, too, very rapidly, crying loudly for help.

We could see our horses rolling over and over, and vainly struggling in the seething water near us. We floated down 40 or 50 rods, when friend T. struck the roots of a tree lying in midstream; but I went some ten rods further with my part of the raft, which then struck a snag, and I jumped upon it and let the raft go. The snag stuck up out of water only a few inches, and was so small that I could sit down only by putting my feet in the water. Here I sat for over two long weary hours, momentarily expecting to be swept off by some huge cake of ice or log of driftwood. My clothing was wet through and through with ice water, and I was so cold that I had to shut my jaws tight to keep my teeth from chattering.

Could you blame me for wishing that the bees were at the bottom of the Red Sea, or at the mercy of this raging torrent, which now threatened my life? We were finally rescued by courageous men in a boat, our wet clothing exchanged for dry, our chilled and stiffened limbs rubbed and warmed, and our drooping spirits gladdened by the joyous greetings of our friends. Our horses were all drowned. My team was a valuable one—my main stay in run-

ning my farm. My wagon and lumber were lost; \$400 all swallowed up in a moment; more money, probably, than I ever received for honey. One of my lower limbs was injured when the bridge went down, and I have not been able to do much since. On our way home friend T. said, "What do you think of making hives now?" I told him that I wished that I had never seen one.

H. O. MORRIS.

Tiskilwa, Ill., March 2, 1883.

Friend M., you are not a candidate for Blasted Hopes at all, for if there was ever a man that ought to thank God for a marvelous deliverance, with not even a bone broken, you are he. Suppose your team *is* gone, and your lumber; *you* are spared to take care of your wife and children, and have all the world before you. You have also given a timely warning to all of our readers, to beware of going over bridges in a time like that, and taking such risks. Troubles come in all occupations of life, and your bees are no more to blame for it than your poor faithful horses. Be not cast down, but reach up and let your faith grasp hold of the promises of Him whom even the winds and waves obey.

### ODDS AND ENDS REGARDING CELLAR WINTERING.

DOOLITTLE'S BEE-CELLAR.

IF the readers will turn to page 69, Vol. 5, they will there find a description of how I built my bee-cellar, or "mud hut," as some called it, during 1875, the time when it was built. As all the material used was wood, it became so decayed that the past fall I rebuilt it, putting up good stone walls, and lengthening it 6 feet. It was covered nearly the same as in 1875, except that I put on an outer roof to keep the three feet of dirt dry. The walls are about a foot thick, and laid up in mortar.

#### SUB-EARTH VENTILATION.

For ventilation I dug a ditch 100 feet long and 2½ feet deep, into which I placed two tiers of 3-inch drain-tile, one above the other, so that in case any water came into the cellar, the lower tier would answer for a drain. In the opposite end from this I placed a 5-inch tube running through the roof, having two elbows so as to entirely exclude the light. During extremely cold, windy weather, the lower, or sub-earth ventilator, has been closed partially or entirely, but the upper one has been open all the while. A high wind during extreme cold will cool the cellar too much if both ventilators are allowed to be open. In this cellar I placed half my bees from the 3d to the 20th of Nov., and after they got settled it has not varied two degrees; standing at 42 to 43° for over 3 months. Heretofore in the old cellar many bees came out of the hives and died on the cellar bottom; but the past winter there has been but very few. Three days ago I swept up all I could get, and a two-quart measure would have held them all, that being all that had accumulated during the whole winter. I often go into the cellar without a light, and stand several minutes and listen. A slight hum is all that is heard, with scarcely a bee taking wing and flying to the bottom, while in the old one the roar of the bees was much louder. At least two bees a minute would fly to the cellar bottom, and often several would be flying at once.

I have swept as many as 2½ bushels of bees off the bottom of the old cellar during the winter, from 60 colonies of bees. The caps of all the hives were filled with straw before the bees were set in the cellar, and the hives piled one above the other till 3 high, leaving an alley at the back end of the cellar. I removed the caps of some the other day while sweeping, and raised the quilt. The bees scarcely stirred, but were all quiet and nice. By breathing on them they would arouse and thrust out their stings. The air inside seems to be quite moist, for large drops of water stand on the stones where not covered with mortar.

#### WATER FOR BEES IN WINTER.

In preparing the bees for putting in the cellar I left some of them with the enamel cloth on, by way of experiment; and upon reading W. Z. Hutchinson's account of how Mr. Robinson, of Pewamo, Mich., shoveled snow into his cellar to keep the air moist. I thought, why would not enameled cloth keep the inside of the hive in just the right condition as to moisture?

#### ENAMEL CLOTH FOR A COVERING WHILE IN THE CELLAR.

I knew where three of the swarms having enameled cloth over them were, and immediately went to the cellar to examine them. Upon taking off the cap I placed my hand on top; and by the warmth of the cloth I ascertained that the bees covered at least half the surface underneath the cloth, thus showing that the theory of enamel cloth being cold and damp for bees is not proven by fact. I carefully raised one side, when I found the bees located just as I had believed them to be by the warmth above the cloth. All around the cluster, but about 1½ inches from it, were large drops of water hanging to the under side of the cloth, but I have never seen a colony more quiet nor in better condition after being in the cellar 4 months than was this. The other two were found to be in equally good condition; and if nothing unfavorable occurs during the rest of their stay in the cellar, and after setting out, I shall try it quite largely another winter.

On page 122, J. E. Frith wishes to know how many dead bees should be found on the cellar bottom. Above I have given him the two extremes. One thing I forgot to mention, which was, that in sweeping out the whole cellar not a bee flew to the light—something I never had happen before in an experience of 12 years of cellar wintering.

Bordino, N. Y., Mar. 20, '83. G. M. DOOLITTLE.

Many thanks, friend D. I like the idea of your bee-cellar so well that I feel now quite a mind to try part of our bees in something similar another year. No doubt the enameled sheets would do nicely in such a cellar, but perhaps they might not always do so well for outdoor wintering. It will be remembered that friend Boombower has suggested the same plan for providing the bees with water in the winter. Would not your sub-earth tubes be better, if longer than 100 feet, friend D.? Would this not obviate the necessity of closing the tubes, when there are very cold high winds? The water in the lower tube would keep the air in the cellar damp enough, so that moisture in sufficient quantity would always condense on the enameled cloth, to give the bees all they would ever need without getting restless and trying to go out of the hives. We have had

many reports, it will be remembered, where bees were made quiet by giving them water in the cellar.

### FROM THE BOX-ELDERS.

MR. DUSTER'S OPINION OF THE CYPRIANS, AND SOME OPINIONS, ALSO, OF THINGS IN GENERAL.

WITH his chin resting upon his crossed arms, and leaning on the board fence which partly surrounds his apiary, we saw our old friend Mr. Duster a few mornings since, evidently unconscious of all things about him, meditating. We saluted him by suggesting that he was taking a rest, or was his *chin* just a little tired, or something?

"Yes, yes, young man; never you mind about the chin! but I *was* taking a rest; for I have been looking over my old journals, noting the different and varying reports of bee-men in their experience with the Cyprian bee, and the conclusions that many of them have come to. I confess it has tired me not a little, for I *don't* see how a careful man can decide so quickly as most have, as you can see by these reports, whether these bees are desirable or not. A majority of the reports the first of the season, I think, were unfavorable to them; but since the close of the working season, and parties have had more time to compare and carefully judge of results, they have been more favorable."

In resuming, Mr. Duster said, with considerable emphasis,—

"Now, I will say here what perhaps I ought to have said long ago: That in these talks I do not set myself up as some 'Sir Oracle, and when I ope my lips, let no dog bark.' I simply give you my experiences and conclusions: do with them as you see fit—that's all.

"In the three seasons," said Mr. Duster, returning to his talk on the Cyprian bee, "in which I have had them, they have impressed me rather favorably in many ways. Now, some say that they do not commence breeding in the spring as early as Italians. Of this I am not certain; but I *am* quite certain they are ready for work, as far as numbers and strength are concerned, as soon as honey appears, and that is soon enough. Instead of it being a fault, I think it one of the best recommendations, if true; for I am one of those who are not in favor of haste in early spring breeding. Ten to one you do not exhaust your queen and stores, in so doing, to no benefit, but very likely a damage. Save the stores, is my motto, and it is one of the *main* reasons why I winter my bees in a cellar; but we are getting from the subject. Almost all reports speak of the peculiar trait of the bees, of filling their hives suddenly with bees, and of keeping them so through the season. This has been my experience with them too—not a bad fault, I reckon. Many have reported this fact, for such, undoubtedly, it is; but a few claim that they give most of their efforts to this business of breeding, instead of collecting honey."

Here Mr. Duster suddenly dropped his chin on his arms again in the old position on the fence.

"Well, one needs to take a rest to draw a bead fine enough to see how such a condition of things could or can exist. They say they are a smart, active, nervous little insect, but—and here the whole thing takes the strangest kind of a turn—a sort of back action I can't understand. 'Smart, active!' That is so. But what puzzles me is to know what they're

smart and active about, if it is not shown in gathering honey—the bee's normal business."

Here Mr. Duster reviewed a little, and changed the subject somewhat.

"Now, this holding back in breeding in early spring, and then rushing things as soon as steady warm weather comes; this nervous activity in all that they do, and especially in breeding up so quickly, and gathering honey so rapidly, are traits I should like to retain in my apary."

### HYBRIDS FOR HONEY-GATHERING.

"And now to change the subject somewhat, let me tell you, *sub rosa*, that when a swarm of bees does extra well in gathering honey, on examination it almost always somehow turns out to be a hybrid. At first I did not like to own it—I don't really like to now; but it has forced itself upon me against my will. Now, these are my views in crossing bees, or hybridizing, as it is generally called. This crossing has been mostly with the brown or black bees. Now, then, as it is claimed that the Cyprian and Holy-Land bees are distinct breeds, why not use them to cross on our Italians, instead of the browns and the blacks? I can not see why we may not expect as good results, yes, better, in every way, with a cross of this kind, and besides save our beautiful golden bands. I plead to the weakness of leaning to the side of beauty, especially when other things are equal. Many say that they don't care for the golden bands; it is honey they want. Yes; but why not have both? Throw aside all idea of breeding for beauty, and bee-keeping, to me, would lose half its pleasure and interest. Young man, you needn't tell me," and here Mr. Duster straightened himself up to his full height, "that you selected your young and beautiful wife *only* because she was a good worker—smart to get grub, and so on. You know that all else kicked the beam, and beauty brought the balance down by at least two-thirds majority, and 'several back counties to hear from!' You'll not deny it to me, and you dare not to your wife."

I saw that the old gentleman thought that he had me; so, to change the subject a little, I asked him how he was pleased with the cross so far.

"I am quite satisfied; for certainly they have proved good workers—kept their hives full of bees, have been moderate in swarming, lost no beauty in color, but I think have improved it, and given me the best and handsomest drones I ever saw, which, I think"—

Here I interrupted him, for I had heard from some of his visitors of his beautiful drones, and how much he delighted to show them, by asking, "How about the gentleness of your Cyprians?"

### MR. DUSTER GIVES US A LITTLE "COW" TALK.

"Well, you know that they have been generally reported as cross and vicious; but mine have not been so. They have been as gentle as my Italians; perhaps I have handled them with a little more care, as I would any other creature that I saw was quick and nervous. I would use the same judgment with them as with a nervous horse or with the little Jersey cow. If one is rough and unpleasant with the Jerseys, and gives them a little of the stool occasionally, and so on, he will soon find that he has got the most vicious little brutes he ever sat down to; and, what is more, *he made them so*. Treat these active, nervous Jerseys gently and kindly, and you have in return one of the most kind and gentle of cows: treat them otherwise, and you have the most vicious.

"Perhaps you may think, from what I have said, that I judge the Cyprian to be the coming bee, or at least equal to any of the bees we now have. While I do think they have many good and distinct characteristics of their own, yet I judge all breeds of bees by taking the Italian as the standard; and as 'from the ocean's level all heights and all depths are measured,' so to me the pure Italian is the standard of comparison among bees. They stand among bees as short-horns among cattle, and beef among meats; as Concord among grapes: I think I'm understood.

"Talking of cross bees reminds me of a little scene which took place in my apiary last fall, all of which I saw, and a part of which I was.

"I was plagued out of all patience by a bee-bore—a regular 'crank,' and I could not get rid of him, nor stop his everlasting talk; say or do what I would, he would still hang around with that silly, sickly smile of his, which, by the way, beats Lydia E. Pinkham's by a big discount. Well, Chipperfield, as we will call him, was here one day, boring me with his useless talk and senseless clatter, when all at once he wanted to see some pure Cyprian bees—heard they were cross, and so on. I stepped to a hive that I knew was cross—would not swear they were Cyprians either. He stood at one side of the hive, when I lifted the cap with a snap, and—he saw 'em! Run, did you ask? You never saw a bottle-bellied old fellow like Chipperfield fly, I reckon. Run? didn't he, though! I doubt if he ever before had as many inducements to do his level best; it was one of the best efforts of his life. Why, you couldn't see the big patch on the seat of his pantaloons, for the shower of sole leather in his rear!"

Here Mr. Duster turned to go to his house, and I heard him say something about being *rested*.

R. H. MELLETT.

Amboy-on-Inlet, Ill., March 6, 1883.

## MAKING PLAIN SHEETS FOR FOUNDATION MILLS.

IS THERE ANY THING NEW UNDER THE SUN?

I HAVE been experimenting this winter with mold for wax sheets for heavy fdn., and have come to the conclusion that I do not want to dip any more sheets for thick fdn. My first molds I made of boards, but they would warp in spite of my efforts to keep them straight, and I finally adopted thin plates of plaster, or lime and plaster; and with these I have no difficulty in molding nice even sheets.

"But, what are the advantages of the molds?" you will say.

Possibly for the large manufacturer there may be little or none; but for the bee-keeper who wants to make fdn. for home use I think there are some advantages. The greatest, perhaps, is that a small quantity of wax may be formed into sheets quickly; all the melted wax is used up, and no large tank or dipping-vessel is required. The sheets are of an even thickness, and the fdn. made from them is even in surface and quality. If a feather edge is desired to start through the mill, it must be provided for at the bottom of the mold. It is requisite that the mold be quite warm, and the wax about the proper temperature to dip well, in order that the sheets be even and solid.

Now, brethren, if any of you want to try this plan, go to work and make your molds of the materials named above (thin slabs of sandstone, or any porous

stone would doubtless answer); put a strip of rubber around the edge of one slab on three sides; clamp the other slab to it, and pour the wax quickly in the open side. Keep the mold damp with a sponge and hot water. It should be put in warm water before beginning to use it, and allowed to absorb all it will. I have found the dipping of wax sheets to be quite a tiresome job; but I can mold them all day without fatigue, and can mold a few dozen sheets at a time when I have the leisure, without having to waste half of it in preparation.

This is all I know about molded wax sheets, and I am too busy to answer any postals on this subject.

Maysville, Ky., Mar. 15, 1883. W. C. PELHAM.

It will be remembered that we used plaster dipping-plates a great many years ago, in our earlier experiments, but they were abandoned because they so soon became soft, and broke. The idea has been suggested, of casting the sheets as we cast bullets; and I think very likely it appeared in GLEANINGS some little time ago. It was suggested, that by having molds enough the melted wax could be carried from one to another, and by this means make them even faster than by dipping. I have never heard before that it had been really put into practice, and we hereby tender thanks to friend Pelham for his invention, and the free way in which he gives it to the brethren. It seems to me it would be an advantage to have the plates hinged, that they might be quickly opened and closed. Well, after we get this done, why not have the plaster plates made with the fdn. imprint in them, and then we shall have the same apparatus now used by friends Faris and Foster, only that the wax is to be poured between the plates while closed, and set on end. This, you see, does away with all daubing and waste of wax; and if you have only 1 lb. of wax, you can make a full even pound of fdn. The only trouble I fear is, that the wax would not run into a space as thin as we should want for the base of the cells. I do not think any kind of porous stone would answer as well as the cement made of plaster and lime. We have experimented a good deal in the matter. If the plan will not make nice thin base fdn., it will certainly answer for making nice sheets for rolling. I do not think, however, it can be well worked as rapidly as the long dipping-boards we are now working, making four full sheets for L. frames at every dipping. We dip the board four times, changing ends at each time. This makes the sheets of a thickness so even that, when rolled, we can hardly see a difference in thickness in the whole sheets.

A few suggestions in regard to making these dipping-molds may not be amiss. A pair of common slates hinged together will be about what we want, if they can be procured large enough. In case the plaster should be found to cleave off from them, a few holes might be drilled through the slate. Fill one slate first, and with a straight-edge stroke it off perfectly level. When dry, oil the surface and fill the other; and when both are dry, separate them by the rubber strips on three sides, and they are ready for use. I think they might be made so accurate that the sheet when rolled would fit your frame without any trimming.

## DOOLITTLE'S NEIGHBORHOOD IN ANOTHER LIGHT.

BY ANOTHER NEIGHBOR.

**T**O-NIGHT I received Jan. and Feb. numbers of GLEANINGS, and on page 20 I find an article from Henry Wirth. In regard to the honey crop of 1882, I think friend Wirth is mistaken, as I have kept bees since 1876, and the last season was the poorest I ever had. The year 1876 was a poor one; but I can't say how poor, as I did not know much about the business at that time.

My bees came through the winter of 1882 the best, and bred up well, and wanted to swarm on fruit-blossoms, and gathered the least surplus honey I ever had gathered per colony, and I have had as good success in getting surplus honey as the most of them from the number of stocks I have had in the spring of each year.

The season of 1881, my bees averaged me 162½ lbs. box honey, spring count. The season of 1882 they did not average me more than one-fourth that amount. My worst drawback has been in wintering my bees. I have wintered outdoors until this winter, and have got them in a cellar under my house, which I prepared expressly for them. I put into the cellar 38 colonies Nov. 16, in good condition, and they seem to be doing well; but I have to guess how they will come out in the spring.

Now in regard to the time basswood opened: I think friend Wirth is mistaken about its opening July 18, as it did not open at my place until July 25; and I watched it very closely; but I am about six miles from friends Doolittle and Wirth, but lower down, and a little earlier. I think friend Doolittle is not a man who wants us to believe him to be a "big man" in the ranks, even if he is a big man in flesh; and I think we can depend on what he tells us, every time, as I have always taken him for my guide, and he has not misled me yet; and as I call on him at his place I always find him ready to do for me any thing that is in his power; and in regard to keeping correct dates of bee forage, I think friend Wirth and myself a number of degrees below friend Doolittle, as he is a very careful man. A friend of mine said to me last fall, after being at his place, "Every thing was in such perfect order that the grass was not allowed to grow crooked about his place; and in regard to his strain of bees, I think we shall have to look around for some time before we can beat them; and if we had a few more Doolittles to rear our queens for us, I think our honey crops would come in more favorably."

In regard to friend Wirth's honey crop for last year, it was good for the year. I met friend Doolittle in August last, and he told me about Wirth's honey crop of the season, and could not account for it; but his place is about 2½ miles from friend Doolittle's, and in a hollow, and nearer the lake, and his bees must have reached some place where friend Doolittle's did not. You will always find friend Doolittle's hives that he is running for surplus honey, boiling over with bees when there is any honey to be gathered. If he has only enough to fill one hive, they will be together.

I am no practical writer for bee papers, but this I could not pass by. If they have any better bee-masters on Spafford Hills than friend Doolittle, I should like to have them "trot them out;" and for one, I should like to get acquainted with them.

Navarino, N. Y., Feb. 12, 1883. BYRON CASE.

## WHO SHOULD KEEP BEES?

FRIEND HEDDON "RESUMES."

**N**OW, friend Root, in regard to this matter of overstocking as I left it last month. Will not a great many look on this subject as I have portrayed it? Do they not already? In fact, how many old successful honey-producers (not connected with supplies at all) are there who do not? I don't know of one.

Bro. Root, the time has gone by when I can be accused of any selfish motives in holding and penning such doctrines. First, while I am a producer on the scale of 500 colonies, and in fields clear of opposition, I am also, as you well know, a supply dealer; but though a growing one, my heart and sympathies are with justice and the producer in this matter. Justice, as I see it.

Second, I think I am now where my financial circumstances are sound enough to give me, during my remaining days, all that I have a right to demand from Nature.

Third, I should dread to think that I wanted to prevent any invalid, or otherwise partially helpless person, from taking to himself any success that might accrue from his adoption of our business; but you know I have a legitimate right to think I know something of what has to be understood and done, to make this pursuit a real life success; and I think I see clearly, that just ahead only those who are best adapted to it will succeed; and to urge others in, is greatly to damage them, and also those already in, who might succeed were it not for that worst of all opposition, *fading* opposition. Before closing, I wish to say a few words about

### BEE-KEEPING FOR WOMEN.

While I do not, and never have believed this business specially adapted to the weaker sex, I am confident that there are women, some of whom I have seen, that possess both the mental and physical requirements of successful apiculture. Many are the feminine brains, but vastly fewer the muscles, adapted to it. Much more may be and should have been said and written regarding the best methods of assisting the muscles of such clear-minded and enthusiastic bee-keepers as our old acquaintance Cyula Linswik (see page 73). It gives us a lonely feeling, to think of losing these sisters from our fraternity, believing that they like and understand the business, and supposing that they are in a field not overstocked, or otherwise specially unfavorable, and that their great want is light, practical, and easily manipulated hives and fixtures, together with competent help at the right time. I feel as though these wants can be very easily supplied, and we retain the ladies while they retain the business at a good profit. I am not a large nor strong man, and should not be surprised if Mrs. Harrison, unincumbered by swaddling-clothing, would carry larger hives and more of them, in a day, than I could; and consequently I have always been working toward easily manipulated fixtures and methods. If Cyula will send her sister down to Dowagiac, we will show her fixtures and methods that we feel sure will inspire her with new enthusiasm, and Mrs. H. will make her visit pleasant, and entertain her on other subjects.

The prime object in my Student school is to yearly put into the field young men (and women too, if they apply) possessing not only theoretical but practical knowledge of the ways and means to the

end of thousands of pounds of surplus honey. I am careful not to take any except such as those I believe to be honest and capable; men of native integrity and tact; and, as above stated, the main object is to have help from some of these students, a portion of which will perhaps desire for a time to work for wages, thus putting into the arena that long-felt want — competent help.

To conclude, I will say that I believe the time is coming when the honey resources of this country will be fully utilized; such is best for the country; best for honey-consumers, and will work well with the producers, provided the influx into our business constituting this great growth is properly studied and wisely managed by the present leaders of the pursuit.

There is no need of producers interfering with each other's interests, either in the field or in the market. Let us be educated in this very important branch of our interests, as well as to how to care for our bees.

In next issue I will reply to James B. Mason, and tell him *why* I use and prefer the case, to the broad-frame method; also state what seems to me to be clear objections to friend Walker's system of surplusage, as well as his section. I may be mistaken; but if I am, I will give him a chance to do me the great kindness of converting me to a better way.

Dowagiac, Mich., Feb. 7, 1883. JAMES HEDDON.

I heartily agree with our friend Heddon in the main, but I can not quite see that any one has as yet urged people to take up the business, who are unqualified for it. Neither can I find that very many localities have ever as yet been overstocked. Patent-hive men have, it is true, urged people to go into the business, from selfish motives; but I can not remember having seen in any of our bee journals any thing of the sort. Where people are attracted to the business, and want information, we are, of course, always glad to furnish it; but I believe we have faithfully presented both sides. As for myself, I have published the worst and most discouraging letters I have ever received, and have given them prominence, too, for the express purpose of letting every beginner know the dark side of the business. There was one point in Medina County that I have reason to think was, for a year or two, overstocked; but very soon several gave up the business, and the most energetic one of the lot (our old friend Shane) started another apiary a few miles away, and the greater part of his yearly crop, which has, you know, averaged large, has come from the branch apiary.

#### FRIEND DOOLITTLE'S LETTER.

TWO THIN COMBS IN ONE SECTION.

**I** NOTICE on page 67 these words: "Has any one ever had two nice combs of honey in one section?" Well, not exactly; but in the instance I will relate, the plan was the same as that proposed by friend Hasty. When the 2-lb. sections first became prominent before the bee-keeping world, Mr. Ranney, of Elbridge, N. Y., conceived the idea that honey could be more profitably made in the 6-lb. Langstroth box, than in sections used with separators. As the 2-lb. sections brought about 5 cents

more per pound in market, he proposed cutting two grooves around the outside of the box (so as to nearly cut through) with a fine saw. After being filled they were to be shipped to market whole, and the grocer was to separate it into 2-lb. sections by simply splitting apart with his penknife.

Mr. Roberts, of Syracuse, N. Y., who bought all the honey about here for years, encouraged the idea, and placed this honey in New York and elsewhere, together with the regular 6-lb. box and the 2-lb. section. Upon asking him afterward about the matter, he told me that he could get no more for honey put up in that way than he could for the regular 6-lb. box, which resulted in Mr. Ranney's abandoning the idea, and adopting the 2-lb. section with separators.

The reason given for their non-practicability was, that when honey was plentiful, the bees would put honey in the outside cells, next the wood, and cap it over; hence if the combs were not of equal thickness (as was often the case when no separators were used), the splitting of the box apart caused the honey to leak from the ruptured cells that overlapped the groove.

WIRE SCREENS, FOR WINDOWS TO THE BEE-HOUSE.

Friend Fradenburg thinks, on page 70, that "Doolittle's bees are not very smart." Well, let's see. In 1873 I stored my honey in a small bedroom, placing the honey on shelves four feet from the floor. This bedroom was on the further side of the sitting-room, and the only means of access was through the sitting-room, which was 14 feet wide. The door to the sitting-room had a crack under it large enough to admit a bee. There were blinds on all the windows, which were kept closed to keep the rooms dark. One Sunday after the honey was all stored in this bedroom, and the honey season over, Mrs. D. and myself went to church, leaving the hired girl at home. Soon after we started she thought to go away, and in getting ready she left the sitting-room door open a few moments. As the door to the bedroom was slightly ajar, a few bees got a taste of the honey before the sitting-room door was shut. On my return I heard the shrill notes of robbing; and upon going to the house I found a stream of bees going and coming out from under the sitting-room door. Going to the back part of the house I entered through another door, and, lighting a lamp, imagine my surprise to see a stream of bees nearly 2 feet wide marching on foot to and fro across the sitting-room into the bedroom, half way across that, and then up to the shelves. Well, without going into further detail, suffice it to say that the bees "wig-gled" into that room after that for nearly a week before I could get all the different places of access stopped, which they would hunt up. Now, friend F., were you not a little hasty in saying your bees would get into that space behind the screen, above the window, "quicker than you could say cat"? Are not you and friend Root aware that in all the instances you have given, the bees found those cracks and key-holes from the scent of the honey, and from nothing else? Bees don't know how honey looks. If you don't believe it, can some up so that none of the odor can get out, and not a bee will look at the can, whether it contains comb or liquid honey; but make a small crevice, so the odor can get out, and in time of scarcity you can will be covered with bees from morning till night. Now, apply this to your screen window. The largest volume of odor comes through the screen, and hence the bees try

to get in at that place. If they chance to fly about the top, there is no odor there; hence they make no effort to get in at the top. As the native instinct of a bee teaches him to go to the light, so those inside fly to the screen. The next thing nature teaches the bees to do is to climb to the top (instead of from side to side or downward) as soon as she finds she can not go straight out. If too heavily laden to go with ease, a part of the load is given to the bees outside, which makes them try the harder to get in when the odor comes through. Upon reaching the top, away goes your bee; and as none return, the room is kept free of bees. Bees do not reason, but do only that which instinct prompts them to do. Try it, friends, and be convinced. G. M. DOOLITTLE.

Borodino, N. Y., Feb. 15, 1883.

### BYRON WALKER'S COMBINED CRATE AND SHIPPING-CASE.

#### How to avoid Propolis on the Sections.

SEE FEB. GLEANINGS, P. 61.

**I**N reply to the questions which you ask me in the last number of GLEANINGS, in regard to the combined crate and shipping-case that I use, I would say, first, I dotier up these crates, and am troubled but little by having the sections soiled with propolis. As my hive has a bee-space above the frames, in making crates no space is allowed beneath their bottom slots; and, of course, in tiering up, the tops of sections; in one crate are entirely covered by the bottom slats of the one above it. As where Simplicity hives are used we have to allow a space for the bees, they are at liberty to propolize the tops of sections when tiered up. We can avoid this, however, by turning the cases bottom side up when tiering, in which case the sections of the upper crate rest directly upon those of the one beneath it. As the sections are crowded close together from both ends and sides of crates, there is but little chance for gluing either the ends or sides of sections, especially where there are not projections at their tops and bottoms; in which case, when tiered, they are entirely covered with the bottom slats.

There is, however, a bee-space at part of one end of crate, and also at the sides of the outside rows of sections, the same that you object to between the edges of all the sections in the proposed new style. Right here I must say, that I can hardly see the force of your objection, considering the advantages to be gained, as I have always reckoned the particles of propolis, found where a bee-space was given, as among the smallest obstacles I have had to contend with in handling comb honey; at any rate, I can see no good reason why bee-glue is any more objectionable in this case than in the extra spaces always left by the bees where separators are used.

Second. I have used sections at the sides of brood-nests in broad frames nearly four inches wide, so as to take two widths of sections in each frame, the top of the frame being made so as to remove easily; but I have discarded this plan in favor of the one given last month, it being altogether too much trouble.

Third. I usually allow the bees to entirely finish capping the sections before removing the crates, but always tier them up when the outside sections are partially capped over, when the flow of honey

and the strength of the colony will permit it. I would say, however, that where the L. frame is used, the best results will come from using crates adapted to eight-frame hives, as the bees seem reluctant to cap over the outside sections of larger crates after tiering.

Fourth. I presume it is hardly possible to space the bottom slats of crates so accurately as to make an absolute queen-excluder, and at the same time allow room for the bees to pass at all points; still, it is not very difficult to secure a practical excluder without hindering the passage of the bees. I do this by spacing the slats 3-16 or even 7-32 of an inch apart instead of 11-64. Not one queen in a hundred will pass through this space from the brood-nest to enter the sections. Perhaps the best way to space the slats accurately is to make use of a number of short blocks of thoroughly seasoned hard wood an inch or more in width, and exactly as thick as the space desired, using twice as many blocks as you desire spaces, or one at each end of each space. When the slats are in position, secure with wire nails.

It seems from page 72, that friend Mason does not agree with me as to the relative merits of broad frames and the combined crate and case; though in the light of my experience he has failed to make a single point in favor of broad frames. I have already shown that it is not necessary to separate the sections by any space in tiering (at least where only two crates are used); and though it were, this is a small matter compared with not being able to tier up at all. Again, with the crate I use I have never found it necessary to handle eight sections, much less one at a time. This may be tolerated where one has but a few colonies to handle, and can find nothing else to do; but when large apiaries are to be dealt with during a flow of honey, twenty sections are none too many to handle at once, and I often have occasion to lift forty or even sixty at a time.

Perhaps friend Mason is correct about getting partly filled sections filled out at the close of the season; but with me, at this time of year, bees often work well in a crate of such sections placed near the center of the brood-nest, when they would be apt to be lugging the honey out of them had they been placed in broad frames above; besides, contracting supers by means of division-boards, and at the same time wedging the sections close together, especially at this time of year, is a matter that works better in theory than otherwise.

The last consideration mentioned by friend Mason, that of grading our honey before shipment, which you speak of as being a strong argument in favor of broad frames, certainly deserves careful attention; but I hardly think we are warranted in adopting his conclusion. Of course, there will be crates where unfinished sections on the outside must be exchanged for others more perfect, and doubtless there are localities where the flow of nectar is at times so continuous, and varied in quality, that great pains must be taken in order to keep the different grades separate; yet where crates of not over an average size are used, holding say from 20 to 25 lbs. with open-top sections (none other should be used with such combined crates), and the locality is what may be regarded as an average one,—that is, one with an early and a late harvest, with a period of scarcity intervening,—it is not very difficult to grade your honey with tolerable correctness, without handling each particular section; an operation requiring no

small amount of time and labor when both are particularly precious, and always attended by considerable loss from bruising and breaking of sections, etc., even where the most careful hands are used. I have never found it advisable to try to keep the different kinds of early honey wholly separate, nor any of the late-gathered kinds, except buckwheat, which bothers me but little, as the bees nearly always have better pasturage at that time. Where one has crates of nearly finished sections at the close of any harvest, he may readily secure their completion by means of judicious feeding, or such sections can always be disposed of to advantage in your home market, while those that are unsuitable for this purpose can either be extracted, or be used as the basis of the next harvest, as may seem most advisable.

But I had nearly forgotten that one more capable than I has been called upon to discuss these questions, and who will doubtless view this matter from quite a different standpoint; so I will bring this article to a close. In conclusion, you speak of having had quite a number of complaints from parties to whom I sent sections last year. I think I may safely conclude that the complaints were chiefly from those who were expecting dove-tailed sections from you; and having never tried the nailed ones, thought, like friend Green, that they would not like them. I am led to say this much, as I never received but the one complaint from him, and, as you have seen, he changed his opinion after a thorough trial; and as several of the half-dozen parties to whom I sent sections for you have since ordered largely from me, I take it for granted that they have repented also.

BYRON WALKER.

Capae, St. Clair Co., Mich., Feb., 1883.

Thanks, friend W. I am inclined to think the points you have been discussing are of great moment to us all. Shall we take our sections singly out of wide frames and crates, and pack them in boxes to ship, or shall we give the bees a case of 20 or more, and after they have filled them, send them to market just as they come from the hive? I am strongly inclined to the latter. The case sent by friend W. is so nearly like our own, we do not give an engraving of it. Instead of hand-holes in the end-boards, he simply runs a groove the whole length. As this groove can be quickly run in before the stuff is cut up, we think it will be a quicker way, very likely. The sections were  $1\frac{3}{8}$  in. thick when first received, but they have now shrunk a full sixteenth. This latter matter is one that will make trouble, if we don't look out; for if we space the bottom-bars so as to exclude the queen, the sections must stand exactly over the spaces, or bees as well will be excluded. The sample case sent, if tipped on one side, will, since the sections have shrunk, close a great many of the spaces. I think this a matter that should be well looked to, in setting cases over the hives. Turn the case over and look into the spaces, and be sure the bees can pass freely into the sections. If they have shrunk, wedge them up a little on each side, instead of crowding them up from one side only, for this will tend to keep them nearer over the spaces. I remember to have heard of a bee-man who complained that his bees would not work a bit in the boxes, when the real

trouble was, they could not by any possibility get in.

If we are to omit separators, I think it is quite likely true that a  $1\frac{3}{8}$ -inch section is to be preferred rather than a 2-inch one; and this will enable us to make a crate holding 23 sections that will easily go inside of a Simplicity hive. As the case is to be sold with the honey, a cheap stout case will be wanted; and as the demand for them will likely run up into the thousands, we shall have to keep them crated up, just as we do sections and Simplicity hives, stacked up in the warehouse, ready to ship.

#### HOW A "BUSTED" BEE-MAN GOT EVEN AT LAST.

ALL IS WELL THAT ENDS WELL.

SOME three years ago one of my neighbors let me have a swarm of bees, for which I gave him \$3.00. They did well, and in the fall they were heavy and full of bees. They wintered well, and in the spring were in good condition, worked well, but would not swarm; and having a wish to have two colonies, I got a neighbor, a bee-man, to divide them — he could do it "just right." Well, he divided them, and I had all I wanted. But when fall came there were not enough bees and honey to winter. I put both into one hive, and fed well. But in the spring they were weak and sickly. Then I bought three swarms; and when fall came they had done but little. One swarmed out and disappeared, and the other two I fed; but they "went up" before spring. This left only the sickly one.

But I determined not to give it up. I sent to you for two nuclei; the first one came to hand June 30, 1881 — the most beautiful queen and bees I have ever seen. I put them into a Simplicity; they did well; filled the hive half full of comb and honey, and plenty of bees. But fearing they would not winter well I took out several frames and put in their place frames containing 6 or 8 lbs. of honey; and when spring came they were in good condition — worked well and increased rapidly, and I felt encouraged to get one good colony. But, to my great surprise, on the 3d of July, 1882, they sent out the largest swarm I ever had, after putting them into a Simplicity (they looked large enough to fill the hive). Then I went back to see if any bees were left in it. But you may imagine my surprise to find the old hive still full of bees; and fearing lest they would send out another swarm, I put on a cap I got of you, with 36 boxes in it. This kept them from swarming. Both colonies did well; and when fall came I got from old hive, 18 lbs. of honey; and from seven, 12 lbs.; all together, 30 lbs.

Now, from that nucleus I got 30 lbs. honey, say 20 cts. per lb., \$6.00; 2 colonies, say \$10.00 each, \$20.00; total, \$26.00.

I put colonies at \$10.00. This may be too high; but I would not take that for them, unless the constant were at my door; but as he has no business with me, \$10.00 each will not buy them.

Brazil, Ind., Feb. 24, 1883.

L. O. SCHULTZ.

Why, friend S., it seems to me that you are a man very easily pleased. Some of our youngest juveniles, I can imagine, will "snicker right out" to hear you tell of be-

ing tickled over only 30 lbs. of honey. Now-days we expect to hear of 300 certainly, from the old stock and the swarm. Never mind; go on and be happy.

### FRIEND TAYLOR'S STORY.

#### BEEES IN NORTH CAROLINA, ETC.

**T**HE bees in this locality have wintered quite well, as usual, and are now busily engaged gathering pollen from various sources, the soft-maples principally. Our winter has been about an average one, and we consider cold weather over for the season.

#### QUEENS BEING LOST ON THEIR BRIDAL TRIP.

Is it possible that the future may bring enemies to bees, so that, in certain locations, queen bees can not be reared?

During the last season, I found it almost impossible to get young queens fertilized; at least, when they went out on a bridal tour they never returned. In a batch of 36 fine young queens, only two returned. The young queens would appear extra strong and lively, and go out promptly; but I think some enemy would gather them in. This was the condition of things the whole season; and though nucleus hives were widely separated and distinctly marked, an average of 85 per cent was a total loss. Nor was it confined to nucleus hives alone. In strong colonies that had swarmed, the young queens, eight times out of ten, would be missed about the time one would expect her to be laying. On this account a great number of strong colonies in box hives dwindled, and were soon in the clutches of the worms. The owners would say, "Well, this is a bad year for bees; the worms are coming around mighty thick, and ruined nearly all my bees; the worms are an awful pest to bee culture here at times."

#### QUEEN-REARING A FAILURE.

If the same fate followed young queens every year that has been our experience during the last, dollar queens could not be reared for less than \$5.00; and even then a man would lose money on them, supposing no customer reported, "Queen to hand, dead as a door-nail; please send me another, quick."

#### ANOTHER HONEY-PLANT — "GALLBERRY."

All our surplus that is worth mentioning is procured from a shrub locally called "gallberry." The botanical name I have not yet discovered. These shrubs grow all through our country spontaneously, and are from 3 to 8 feet high. The blooms are followed by a dark-blue berry which, when ripe, is fearfully bitter — worse than quinine. The robin (redbreast) is extremely fond of these berries; and though we wonder at his taste, we find that, quite soon after their migration here, and through the use of this food, they become very fat and edible themselves. When in full bloom, a bunch of the flowers shaken over a newspaper covers it like dew with the "uncured" honey, which tastes any thing but bitter. This honey is just perfectly splendid; and when I send you a sample the first of June next, at which time it is in all its glory, you will see that it is a number-one quality of pretty light good honey.

#### BEEES WON'T STING SOME PEOPLE (?).

A few days ago, a country man came into our

town with a few pounds of "strained honey" for sale, and soon got into an animated conversation with "some of the boys" on the subject of bees and honey. He told them that there were a few "lucky-born" people who could handle, or do any thing with bees, and that the bees, knowing they "had found their master, would submit to any indignity, and not dare to sting." He also told them that he was one of those fortunate "few," and he just expatiated upon the subject till an old colored man told him, "Go 'way from here, boss, you's just talking." Finally, to show the "boys" that he could back up his word, he followed them out to my apiary (I now have 12 colonies of bees). They soon explained the matter to me, and our bee-man asked my permission to "try his hand," and show the boys what a "bee-king" could do. I referred him to a colony of hybrids out in one corner of the garden, and, without any smoker, he "broached them." I stood off at a respectful distance, knowing that it took two smokers to assist a man in getting into that colony. The "bee-man" opened the hive, gently pulled off the enameled cloth, and in a second I saw at least six dozen hop ever so gently up toward his face (he had on no veil). I saw him "gently" wipe off at least 30 bees from his face, and just then I saw them all over him. He dropped the top, bounded over the fence, ran into me, and took a bee-line for the Cape Fear River (he lives on the other side, somewhere); lost his hat, shelled off his coat and dropped that, and stood not on the order of his departure, but "departed." He did not call for his tin bucket or hat and coat for over a week, and then came in during the night. I think he is cured of handling "everybody's bees." What do you think of it?

Later.—He says the "moon" was not "exactly right," and that was the cause of the bees "getting after him so."

R. C. TAYLOR.

Wilmington, N. C., Feb. 28, 1883.

There may be some enemy that takes off the queens, friend T., although I can hardly understand how they should be able to single them out from among the working bees; and if you have a bird or reptile that is taking working bees also at that rate, it is surely a serious matter indeed. We have at times had a great many queens lost, and, again, hardly one in a hundred fails to return. With our present large apiary, I think we have had less such losses on an average than when we had only a few hives. —Please send me a sample of that gallberry plant, with the blossoms, and we will have it named.

### HIVING SWARMS WITH CLIPPED QUEENS.

#### A SUGGESTION OF VALUE.

**Y**OUR instructions in A B C recommend the moving-off of parent hive and hive-swarm on old stand, and I often see the same advice given in many of the leading bee journals of the day. I followed this plan until two years ago, when I concluded to attempt the hiving in front of old stock, and avoid the hard lifting and disarranging of things generally that had taken me some time to level up and fix to my notion. I accordingly made a platform about two feet square, and about the

height of entrance; left off one end, so as to set well up to the parent hive and over alighting-board. Then took an old box hive and nailed three cleats on the bottom, leaving one side open for bees to enter freely. These and a piece of burlap 1½ yards square I placed close at hand; when my next swarm came out I caged the queen, placed the platform in front, and swarming-box on top, nearly up to the parent hive; I then placed the queen in front, and waited their return. As soon as I saw any indication of their returning I closed the entrance and front of parent hive with burlap. This cut off their entering the parent hive, and they at once took to the box. As soon as they began to enter nicely I released the queen, and all was well. In from three to five minutes I carried them to or near where they were to remain, and fixed their future home at my leisure. This being done, I set them off and turned the platform up to the entrance, and shook them in front; the bees were hived, and the old hive unmo-lested.

I have practiced this for two years, with success every time, and a boy or girl 12 years old can hive a swarm in this with ease.

#### BEES ALL RIGHT.

My 20 stocks, packed on summer stands, were out in full force March 2d. Temperature was 48° in shade, and 68 in the sun. I opened most of them, and found them in tiptop condition, plenty of honey, and bright as gold dollars, and brood in nearly all of them. In one stock, standing at the south end of a large building, and in a warm location, I found 3 frames about ½ full of brood in all stages, and they had commenced the fourth. The bees cover 6 American frames nicely. Would you consider this early brood detrimental? This is my fifth winter with frame hives, and I have yet to lose my first colony. In the winter of 1880-'81, I lost 6 in box hives, all I had.

#### SWARMING OUT IN FEBRUARY.

A neighbor of mine informs me, Feb. 17th, he had a stock swarm out *clean*, and go in with another stock. It was a last-year's swarm, and left 30 or 40 lbs. of honey, all clean and nice; what was the cause?

C. L. BOSTWICK.

Sandy Hook, Conn., March 5, 1883.

Many thanks, friend B. I have no doubt but that your plan will work nicely. Now for the ladies, if not for many of our sex also, we want all these appurtenances light, so you can catch them up and run, if need be. Well, make the platform of thin basswood, securely nailed or screwed together, and then use a basket instead of a hive. If the bees are sometimes allowed to stay in it long enough to have a few combs built in top, all the better. Now, who can give us a strong willow-basket, in the shape of an old-fashioned straw bee-hive, just to be used for hiving swarms? You see, they would never smother in it, no matter how hot the day was, and they could also very easily cling to them.—Who can make them, and how much per hundred? I hardly think the large amount of brood will do harm, if you have bees enough to cover it well.—I could not tell why the bees swarmed out, without seeing the hive. If they stood very close to another colony, I should suppose they might have been queenless, and simply walked or flew over to the hive that had a queen.

## SEPARATORS OR NO SEPARATORS.

FRIEND HILTON'S "TESTIMONY."

I FIND on page 587, 1882, "What Friend Hasty thinks; doing without Separators." My experience being so different from his, I can hardly refrain from giving it. I ran 17 colonies the past season for comb honey, and what increase they gave by natural swarming. I use a combined honey and shipping crate on the second story of my chaff hives. The second story being single-walled, I can place 3 of these crates on each colony, holding nine 5 x 6 sections and no separators. I can use one, two, or three crates, as the colony may require (I will send you a photograph of the hive and fixtures as soon as I can get some taken). I used full-sized sheets of fdn. in my sections, and the result is, that the 17 have increased to 41, and I have taken 1435 lbs. of honey, mostly in 5 x 6 sections, using no separators except a few on some broad frames in brood-chamber, and I have not had a dozen sections but that I could crate, and my 5 x 6 sections were filled a great deal better than the 4½ x 4½ which I had in the brood-chamber, as every one testifies who saw the honey.

Now about the sales: It is nearly all gone in our little home market, at 20 cts. net. I commenced putting it on the market in July, and it has been a staple article here. Now I am fully satisfied I could not have obtained this amount with separators, or got my honey in as good shape. My honey did not come in five pounds a day either; but when the bees took possession of one of those crates they just filled them full and drew out the fdn. in all the sections at once; where if I had used separators they would not have done so. I go through my apiary once a week, and take out all that are finished, dropping in a section with a full sheet of fdn. between two others if I can; but I never take off the crates unless I want to examine the brood-apartment.

Toward the close of the season I take the unfinished sections in the third crate and put them in the other two, and end the season with one crate of nine sections on each hive, just as I commence in the spring; so you see I have but comparatively few unfinished sections. I extracted 78 lbs. from my unfinished sections, making 1513 lbs. from my 17 colonies, spring count, or 89 lbs. per colony.

GEORGE E. HILTON.

Fremont Center, Mich., Dec. 4, 1882.

## SILVERHULL BUCKWHEAT.

FRIEND PERRY'S EXPERIENCE WITH IT.

FOR about seven years, bee-keeping has been a fine specialty with me. During that time we have not had a season but that bees in my locality have gathered honey enough to keep up brood-rearing from the middle of April to the first of September, and sometimes much later, there being a constant succession of honey-flowers from elm, early in the spring, to goldenrod, late in the fall; but our best honey-plants, and from which we derive our principal surplus, are white clover, basswood, and buckwheat. The supply from all other sources is always quite slow. White clover and basswood flourish in abundance here; but for buckwheat I have to depend chiefly on what I sow, as there is but little raised by the farmers around me. I have raised more or less of the old kind of buckwheat every year; but this is the first season that I have had

seed and opportunity to give the "silverhull" a fair trial. I make it a point to sow buckwheat so that it will come into blossom just as basswood closes, and I consider it useless to sow earlier, either for seed or honey.

Last year the season was very late. The 6th of July I sowed five acres. The soil was properly a sandy loam. I put on  $\frac{1}{2}$  bushel to the acre. Basswood honey closed the last of July. About a week later, honey began to come in from the buckwheat; but with something over 100 swarms to work on the five acres, the surplus could not be expected to be very great; yet they filled up their combs, finished off quite a good many sections, and I extracted some. The honey is not nearly so dark as from the old kind, neither does it have that disagreeable odor. I cut the buckwheat, and when it was dry I drew it into the barn, as no machine was nigh, and thrashed it this winter with the flail. When I got it partly thrashed I estimated the crop at 80 bushels; but when it was done and measured I had 110. From 16 bushels which I had ground up I got 103 lbs. of middlings, 103 lbs. bran, and 365 lbs. of the nicest buckwheat flour I ever saw, being very nearly 23 lbs. of flour to the bushel of 48 lbs. S. C. PERRY.

Portland, Ionia Co., Mich., Jan. 25, 1883.

Perhaps we might say, that about 60 bushels of the above crop is now in our granary, waiting for orders, and we are going to try and not get cornered on buckwheat in the way we have been on alsike this season. I am very glad indeed to get so good a report from the silverhull. The amount of honey indicated is far above what I would have estimated.

#### HALF-POUND SECTIONS, AGAIN.

WILL THE BEES WORK IN THEM?

**I** SUPPOSE you are almost tired of this; but now that the subject is being discussed, I have taken the liberty to send you a sample of some sections that I used last season — as an experiment — and also to write a little about them. They are simply the prize section divided into four equal parts, with fdn. starter in each part. I first thought of this style of section when desiring to have a card of honey that could easily be used by a small family at one meal, and not have to be set away, until "next time," to run all over plates, etc.

I was afraid at first that the bees would not work well in them. But my doubts were soon dispelled when I had half a dozen all filled with white-clover honey, and nicely capped. Everybody who saw them exclaimed, "What handsome honey! where did you get it?" etc. I found it to be the neatest and handiest honey for table use that I had ever raised; and the coming season I intend using about half of this kind of section, and half of prize sections. If any of the readers of GLEANINGS have tried anything similar, I should be glad to hear how they succeeded.

CHAS. H. SMITH.

Pittsfield, Mass., March, 1883.

Thanks, friend S. Your experiment seems to decide that bees will work well in a section as small as  $2\frac{3}{4} \times 2\frac{1}{2} \times 1\frac{1}{4}$  at least. It may make a difference, having them separated by only one thin partition, instead of two; but I think not very much. Your experiment, friend Smith, suggests also another thing: It is quite a task to handle so many

small packages; and in merchandise, we see every day that they avoid this by first making packages of a dozen, and then having the dozens also packed in packages of one dozen each. Well, now, if we could have the bees fill these small sections in a little frame of four, eight, or twelve, and handle them only by the frame until they get to the retailer, we should have got ahead quite a little; but perhaps it would be better still to adopt friend Walker's plan, and handle them only by the case of 16, 24, or 28.

#### "DAN WHITE."

HIS EXPERIENCE WITH CHAFF HIVES.

**S**EEING I have given my 120 colonies a good looking-through after their long confinement, I will report how I found them. One hundred colonies in chaff hives in my home apiary are in as fine condition as I ever saw bees at this season of the year. One drone-laying queen is the only thing wrong with the entire lot. I was very thorough last fall when I put them in shape for the winter, using division-boards in every colony, tucking them up according to the size of the cluster, and in every instance I gave them as close quarters as possible; 10 colonies were on four frames, and the remaining 90 were on from 5 to 7 frames.

Bees in this section stored considerable honey-dew, or black honey, and I took this as well as most of the old combs containing bee-bread, or pollen, from them, not leaving more than one comb containing pollen, in each colony. All the rest of the combs were well filled, and sealed with the best clover and linden honey. Every colony handled as above is in a healthy condition, and I believe would not have suffered for a fly for four weeks longer.

I experimented with 6 colonies, taking pains to leave some late black honey, and combs with pollen; and these are the only ones out of the hundred, that daubed entrances. They were very strong colonies, and will go through; but had I experimented with my weaker colonies I could have reported a loss of a share of them at least.

I hear of heavy losses of bees all around me. One man will save only four or five out of 30, and several others report their bees all dead and dying with cholera. I have taken pains to ascertain from each one of them if they put them in good shape for the winter; and in every instance they say they neglected them. Now, my own report of 22 colonies,  $2\frac{1}{2}$  miles from home, 20 in chaff hives and 2 in Simplicity hives, which were neglected last fall. But few were tucked up with division-boards, late stores were not taken away, and consequently I can report a loss of 6 colonies already, and several more will need careful nursing to get them through all right. The two in Simplicity hives were tucked up with a division-board on each side of cluster. I took pains with them, because they were in single-walled hives; put a story on each, to hold chaff cushions; but for all this they are both dead. I believe that, in most instances where losses are reported in chaff hives, they have been neglected. Guesswork with bees will not winter them successfully in any hive; but if put in the best possible shape in chaff hives, on their summer stands, they will winter, no matter how long or severe the weather is; at least, I believe so.

New London, O., March, 1883.

DAN WHITE.

## THE RESULTS OF ONE WOMAN'S BEE-KEEPING.

FIFTEEN 2-HORSE WAGON-LOADS OF COMB HONEY.

(Continued from last month.)

**O**UR experience has been, that it is very difficult to get sections all filled in the sides of brood-frames in the body of hive in poor seasons, and as our hive is a large one (Quinby Improved), we had a good many sections partly built, left from last year, and some from year before. This year every thing was filled, from the bottom of the hive to the top; and as the colonies were so strong, and so much honey coming in that about half of the colonies received a second story, in which the rack on the hive was raised up when half or two-thirds full, and an empty rack set on below; sometimes both racks would be finished at once and all below, making about 100 lbs. all taken off at once. Then we put in a division-board below, and tried to shut off the bees from the side room below, generally setting in large brood-frames, covering over with tin separators to keep out the bees. Then we set an empty rack on top, 40 lbs. capacity, and used the ring, or two-story, for top boxes on other hives that needed top boxes. Very often by the time we could get around to the first hive we would find that the bees had found a way into the covered brood-frames below, and had them full, or half full, of nice new honey, and the rack full also. In some cases we needed to tier them up again. Some hives in the latter part of the season were so full of bees it seemed they could not do without the second story.

### HONEY STORED ON THE OUTSIDE OF THE HIVES.

We had four cases of building under the hives. Before we would find them the nice white comb would be seen sticking out by the side of the hive; but that was, in each case, because the bees had swarmed, and a clipped queen had run under the hive, and the bees had gone under there instead of returning into the hive. The bees in the hive had raised another queen before we found them, in two cases; and as the other two were queenless, possibly a truant swarm had found a home under one or two of the hives.

### MRS. AXTELL'S "HELP."

Mr. Axtell and myself had our hands so full we could not possibly keep up with the bees, especially about six weeks in the fall. During the June and July harvest they had filled all the sections we had prepared for the whole season. As soon as Mr. Axtell could leave the Timber Apiary,  $4\frac{1}{2}$  miles away, he was obliged to oversee his harvest and haying, and start his horse-power saw, and make a new supply of sections, so I was obliged to take my carriage, with a small boy part of the time, and the rest with one of my Swede girls (she could speak but few words of English), as bees were swarming every day, and honey needed to be taken off, 400 to 500 lbs. per day. Another precious little Swede girl at home, 16 years old, had the care of the bees. She sat out under the maples, and nailed sections; when a swarm would come out she ran and caught the queen in a cage, and laid it on the entrance-board, stopped up the hive, and set a nail-keg (bored full of holes) over the queen; one side of keg raised a little; then ran and touched Mr. Axtell, and told him a swarm needed care, if he was sawing, as he could not hear the bell ring. The girl in the house generally called Mr. A., instead of Bettie, our bee-girl; sometimes he would be in the hayfield, and two or three swarms

would be out before word came to him; but that, I think, was the way the bees got under the hives, as sometimes she did not find the queen, and she said the bees went back. These girls did not come to live with us until July, and never had worked with bees before. Considering their inexperience in bee-work, they did exceedingly well. Bettie learned to make sections well, and as rapidly as almost any man. The girl in the house also would nail sections when through work (we prefer nailed sections to dovetailed).

It was a chase for awhile to keep up with the bees. Three times we thought we had given all the room, and more than they could possibly fill; but on going again to their hives we would often find every section full, and sometimes every one sealed. When we came to a hive toward the close of the harvest, that seemed to need no more room, for fear of their not having room before getting around to them, and we thought not best to raise the rack for fear they would not seal it over before the close of harvest, we set a rack on top, then the top box, or a "ring," as we call the rough wooden tiering-up boxes. Often when we again came to the hive we found the top rack half full of honey, and the lower one finished. We ran out of racks to hold the sections at one time, for the second story, so we set on the second story and filled it up with sections, which did not work so well, as the sections would generally get more or less out of shape; but the bees would fill them with honey all the same. We had help, but we could not trust them to put in the sections without working with them, as it is, we think, very particular work to have them put in just right, so the bees will not build the combs bulged when not using separators. We like to keep the full unsealed sections all together, then next to them a section  $\frac{3}{4}$  full; next, one  $\frac{1}{2}$  full, then  $\frac{1}{4}$ . Even if sections are full of foundation, if placed next to a full comb unsealed they will often lengthen out the cells to the full comb, and then build a thin one of the foundation. If we can not grade them down, we like to put the empty section next to a sealed comb, or sealed on one side, or very nearly so. When honey is coming in fast, and the sections left in the hive are in about the condition the bees would build them, they are generally straight and true; but we think it pays to go over the apiary often, and cut out the little flanges that some colonies seem to insist on building.

Through the girls not knowing any better, and our haste, we got several racks on without starters; and as there were no separators in them, the bees, some colonies, built long combs straight through from one section to another, instead of following the section-bar. Of course, such racks were removed from the hive. We ran out of white combs and foundation, and as soon as we found the bees had gone below into the brood-frames we had tried to fasten them out of, we got all the nice comb we needed there, by leaning them next to the entrance at night, and bees would remove all the honey by morning.

### 15 TWO-HORSE WAGON LOADS OF HONEY.

The 30,000 lbs. sent to Chicago made just 15 two-horse wagon-loads. The wagons with top boxes on were all full but the last load. You may be sure my heart went out with those crates of honey, inwardly praying that God would bless them and take care of them, and that every crate might be the means of

saving a soul. Already over \$300 of the first fruits of the sale have gone on its mission of mercy — treasures laid up in heaven, where moth and rust can not corrupt, nor thieves break through nor steal.

#### BEE-KEEPING FOR FEEBLE WOMEN.

When I began working with bees in the spring I could be on my feet but 2 or 3 hours each day; consequently, Mr. Axtell had the greater part of the bee-work to do; but each day I would go out a while in the forenoon, and then again in afternoon, saving all the strength possible for that work. Before the middle of the season I could be on my feet longer, and accomplish more, than he, as many a day I worked more than 12 hours on my feet, with good appetite and good digestion too. I don't know whether it was the bee-stings, the outdoor air, or the love of the work, or altogether, that have done more for me than thousands of dollars spent in doctor bills.

When taking off full racks (40 lbs. of honey) I could not lift them, neither could my girls; but both together, we could, by careful lifting, set it on the little express hand-wagon, and haul it to the honey-house. The honey was brought home from the other apiary in better condition, and also with less work, by leaving them in the same racks they were built in. But when taking out only a few sections from each hive we would place them on end on a division-board, and my girl would carry them to the house and fill up rack; or when I would find a great many racks full, and I thought one of our hands could go over with us the next day, I would mark such hives. When the hand went over he would always bring back a carriage-load of honey — 600 or 700 lbs. He would carry and pack the honey, my girl would carry the smoker, and I took off honey and put most of the sections back in.

#### CHILDREN AS HELPERS.

When closing the harvest I found it paid well for four of us to work together; or any other time, when not needed to watch swarms, one to carry honey, one to smoke, one to take off, and one to put back sections. Bettie got so she was valuable help, and I could nearly trust her alone to take off and put in sections, by having a little oversight. Hannah could smoke the bees; and as she could not speak one word of English when she came, in August, from Sweden (and Bettie came a few months before, and Charley only a year before), they were longer in learning; but Swedes make the best of help when once taught — at least, ours do. They are faithful, kind, and perfectly honest; but it is a great task to teach them, both how to talk and how to work, at the same time — especially girls; but we love them, because they are good.

Mr. Axtell has just bought a new two-horse tread-power that he is to-day fitting up — he and a carpenter, so as to run his Barnes' saw and other circular saws, as his old one-horse power did not give force enough to suit him. Then we want to have our sections all in racks, and with starters in, ready to set on hives when needed. My girls can nail the sections this winter, and they love to make them.

#### WET CLOTHS, TO STOP ROBBERING.

When taking off the last honey, and fitting up for winter, four or five of us would all work with one hive, and the work would be done so fast that bees could not injure each other by robbing, as we would commence so early in the morning that we would get through a dozen or twenty hives before they be-

gan to fly; and as soon as a hive was finished, if a wet cloth as large as a large towel is laid all dripping wet close up to the entrance, so close that a bee can not get out or in, it will stop robbing, and is not so much trouble as to hang a cloth over the front so as to prevent bees getting out or in. The bees in the hive will always push their way out, but the robbers will be driven away by the wet. We discarded the tent two or three years ago, as it was too slow work. We seldom have a case of robbing now, and wet cloths have always stopped it.

My girl and myself would take down second swarms from trees, by waiting until a part had clustered; then hold under the cluster a peach-basket suspended on a pole; then with another pole, but lighter (a bamboo fishing-pole with a hook on the top), shake the limb, causing the bees to drop into the basket. The basket ought not to wave or swing around. We liked the basket better than the swarming-boxes, as given in GLEANINGS. The boxes are too heavy. The idea of the basket on the pole, I think, we also saw in GLEANINGS after we had tried it.

#### AN IDEA IN GETTING SWARMS BACK.

I have this year brought back nearly half of my second swarms, and those with unclipped laying queens (weak colonies are more apt to come back), by simply opening the hive just as the last of the bees are coming out, and taking the remaining bees, and shaking in front of the hive. If they have not already begun to cluster they will often come back. As it is always necessary to go through such hives and cut out queen-cells and give eggs and larvae to hives with unfertile queens, there is no time lost in doing so. I have often had such swarms try to get into other hives which I happened to have open when they were swarming. The roar of the bees in open hives seems to call them back. Mr. Axtell says he never has much success in bringing them back in that way. I always try that method when entirely alone, as I am not always strong enough to hold up the pole, and shake the bees at the same time. It requires strength to do both rightly. If I am sure the issuing swarm has an unfertile queen, as she is generally first out, I have often stopped the swarm in this way also, when caring for bees alone, and no help is near. I close the entrance when about one-fourth of the bees have come out; sometimes this will stop them, as the few bees that are out with the queen seem to think there is not enough of them to make a respectable swarm, and the bees in the hive will give up trying to swarm. Possibly a queen might once in a great while be lost in that way; but when one is alone it is best to choose between the two evils of losing either the queen, or both the queen with the swarm, as our Timber Apiary is in an apple orchard of very large and tall trees.

#### HYBRIDS EQUAL TO ITALIANS.

Our hybrid colonies this year gave us just as much honey per colony as our Italian bees. The greatest amount given by any one hive that we kept a record of was 300 lbs. comb honey and about 4 combs of brood. They swarmed late, but we took away most of their brood, and gave back the swarm. It was a hybrid colony.

#### FROM FOUR TO SIX, AND 400 LBS. OF HONEY.

Our pastor's boy, 12 years old, Willie Gruld, who was with us in May and June, had two colonies which we had given him on his work the year before. They gave him 403 lbs. of honey, and increased

to 6 colonies. Whether all are strong and in good condition for winter, I do not know. The 7th swarm he sold on a tree. Mr. Axtell swarmed the first for him. The first time after that he took all the care of them.

#### VENTILATION IN CELLARS.

We have about 15 colonies of bees in our cellar, and the rest out of doors. As the bees are so strong in numbers in the cellar, and so many of them together, we have to keep the three windows and door open the greater part of the time, both night and day, only shading the door and window so that the direct rays of light will not make the bee-room too light. We are glad to keep them open, as, when closed for a few days, the confined air smells so impure, and cellar air will most certainly find its way more or less into the rooms above, which, if impure, will certainly carry with it disease and death.

MRS. S. J. AXTELL.

Roseville, Warren Co., Ill., Jan. 15, 1883.

(Concluded next month.)

### DO BEES HEAR?

FRIEND SHUCK'S EXPERIMENTS.

CONSIDERABLE has been said, of late, in the bee papers, on the above question; and friend Hasty's translation from Virgil, and his comments on the same, have prompted me to write a few lines for JUVENILE GLEANINGS on this "something of first-class scientific interest." Friend Hasty says: "Some of the children will be surprised to hear that bees are accused of being deaf." I, too, am surprised that such persons as Sir John Lubbock, after playing the violin so closely to his bees, and not being able to induce them to waltz, beat time, or try the key of "one sharp" on him, should fail to discover the effect of the music on them.

If bees do not hear, why should they make so many different sounds with their wings? Turn up the cloth from over a colony of bees, and you will hear several of the little fellows *zeep, zeep, zeep*. Now give them a little puff of smoke, and notice what a different tone, as they beat a retreat down the combs. If they can not hear, why do they hum so loudly when shaken from a limb, box, or basket, in front of a new home? Why do the workers try to catch a young queen, on returning from a flight, before she alights? but as soon as she alights, they treat her kindly. Why do they serve the drones that appear first in the spring in the same way?

But this is not proving that they do hear. I have tried several experiments to prove or disprove that they do hear. I have tried "whacking" stones and shingles together near the hive in cool weather when the bees were all quiet; and in warm weather I have taken the combs from the bives, and tried whistling, singing, and blowing a large sea-shell. The effects are evident; and I repeat the assertion, that I am surprised that any one should think that bees do *not* hear.

In cold weather, if you strike two stones, shingles, or any thing that will make a noise, together near the hive, the bees will make a buzzing noise similar to that when you tap the hives with the fingers or a stick. But in singing, whistling, or blowing a horn, the effect is singular. Short, quick, or moderate tones do not appear to be noticed; but loud, prolonged tones, high or low, as sharp shrill whistling

of the lips, singing, or blowing of a horn, have the same effect.

Now, I should like to have our little bee-folks to make the experiments for themselves, and report, so we can have the testimony of at least two or three, to prove that bees do hear.

If you have an observatory-hive, you can make the experiment without opening the hive. Wait until the weather has become warm, and the bees are very busy. Then take a horn, or something you can make a pretty loud noise with; hold it close to the glass, and just see what a nice rest they will take while you blow; and as soon as the noise ceases they all proceed to business, just as though no one were near. If the noise is quite loud and steady, and the bees are not disturbed, they will all become perfectly still, just as if they were taking a little "nap."

S. A. SHUCK.

Bryant, Ill., March, 1883.

Thank you, friend S.; but as the JUVENILE is more than crowded, I have thought best to put you among the old folks. Those who argue that bees do not hear, would say that it was the vibrations, caused by the sounds you made, that jarred them, and thus produced the phenomena you mention. Then arises the question, What is vibration but sound, or *vice versa*? I wanted to hear you give one case you almost touched—the "zeep" of a queen. Bees will hear this, when it comes from a young queen just being introduced, and will hurry over to where she is, even when they are on a comb, separated from the rest, and held in the hand. I think bees do hear.

### HONEY FROM CORN, AGAIN.

A MISSING LINK IN THE CHAIN, AND NOT A DESIRABLE ONE EITHER.

DESIRE to call your attention, as also the attention of all bee-keepers in the West, to the growing importance of the *corn aphid*. This insect has been known to entomologists for about fifty years, and described by Dr. Fitch, of New York, as *aphis maidis*. It is now becoming a dreaded enemy to the corn interest of the country. The following items are from Mr. Boardman: "About the latter part of July the mature aphides will be found, often in great numbers, together on the tassels of the corn. They are about one-twentieth of an inch in length, of a pale green color, except the front part of the head, which is dark. On the upper and hinder part of the abdomen are situated two small black horny tubes, which stand up like two little horns. From these tubes is secreted a sweet, *honey-like fluid*, of which the ants are very fond; and the presence of the aphides may be easily detected by the numbers of ants always in attendance upon them. You will find a part of the aphides are winged; these are the males. They are marked very much like the wingless females, except that their thorax is black, and their abdomen is a greenish yellow. They have four wings, which are held erect in repose. After pairing, the male dies, and the female lays her eggs, which in a few days hatch, and the larvæ very nearly resemble the parent, only smaller; and, strange to say, this brood is all females, and, by a strange provision of nature, are capable of producing other individuals without the intervention of the male; and instead of depositing eggs they are viviparous, bring-

## Heads of Grain, From Different Fields.

### PARAFFINE FOR FOUNDATION.

**D**O you think it would do to use full sheets of paraffine fdu. in sections? Please give an account of your experience. I intend to try it, on a small scale at least; and if I find there is no danger of melting down, I will use it altogether for comb honey. I think it is foolishness to condemn the use of paraffine for fdu., simply because it isn't beeswax. We make the fdu., and why should we not also make the wax? Paraffine is cheaper, cleaner, and better looking than beeswax. We use it to put extracted honey in, when we wax our barrels, and I have never heard any one protest against its use for that; why, then, may we not have the bees put up comb honey in it? Its low melting-point making it softer at a lower temperature than beeswax, seems to be the only real objection to it. If we can overcome that, no sensible man can object to its use. Now, beeswax is hardened by bleaching. Can we not mix enough of this hardened beeswax with paraffine to make it nearly like ordinary beeswax, without raising it too much in price? As I have a mill, and shall make my own fdu. hereafter, I intend to experiment, and hope others will do the same.

### HEART'S-EASE.

M. F. Tatman inquires about heart's-ease (*Polygonum persicaria*) as a honey-plant. From five years' observation, I am inclined to place it at the head of honey-producing plants in this locality. Only one year out of the five has it failed to produce honey. This year almost all of our honey was from heart's-ease. It began to yield honey Aug. 15, and produced a steady flow for about thirty days; in fact, until it grew too cold for the bees to leave the hive. It grows thickly along the roadside, and in neglected cornfields. A late, wet spring produces a luxuriant growth. This differs from smartweed (*Polygonum hydropiper*), which has a slender raceme sparsely set with greenish-white flowers, while the flowers of heart's-ease are thickly set, and vary in color from light to deep pink. The honey that was produced late in the season was the nicest, thickest honey I ever saw. I extracted some in December; and when it got cold (10° below zero before it candied), it had to be cut with a knife, and could be handled like molasses candy. Many persons, too, prefer the flavor to that of clover honey. J. A. GREEN.  
Dayton, Ill., Fe b. 13, 1883.

Our experiments with paraffine, friend G., were mostly made by mixing it with bleached wax. I think we used about three parts of white wax to one of paraffine. This would roll and work very nicely; but if we used more paraffine, it would break up. We soon found, however, that common yellow wax would bring much more paraffine to working condition than would the white wax, and we therefore concluded that the bleachers, or some one else, had already added more or less paraffine, or some similar substance. I think we made very nice working fdu. with two parts of common wax and one part paraffine. To make sure it would do, I hung sheets in the hive, and fed

the bees until they worked it out; and for aught we could see, it worked just as well as real wax. Several hundred pounds were made and sold before we discovered that, although it worked all right in the spring months, it would not do at all in the hot weather of June and July. The combs melted and fell down so badly, that, after tolerating a few of them for a few years, we cut them all out, melted them up, and used the material for waxing honey-barrels. Now, although we used it quite largely for thin fdu. for sections, I can not now remember that we had any trouble with our comb honey in sections. The sections used then were quite a little larger than our present 1-lb. sections, so there would seem to be little danger from it for this use, unless the honey should happen to stand in the sun; in that case it might melt down. It also seems as if it might work all right in brood-frames well supported with wires, and we are told it is used in this way. As we sold it to many individuals when we made the experiments noted above, perhaps some of them can tell us more about it. If so, please speak out, brethren, and thus save us expensive experiments.

### SECTIONS FOR 75 CENTS PER THOUSAND.

The veneer sections are made at a fruit-box factory in Benton Harbor, expressly for me. You see, in filling those fruit-boxes with strawberries, the thought popped into my head, Why not use them for sections for honey? Very soon some were on a hive, and in a short time were nicely filled; but they were not the right size; so I saw the proprietor of the factory, and he told me if I would get a spur made, at a cost of \$3.00, that would cut them the right size, he would cut them for 75 cts. per 1000. I did so, and have been using the one-piece veneering sections for years. They do not cut the entrances in the sections, but I have a knife made crooked so as to cut them in such a manner as to take a piece out of the edge of the section.

### FORMING THE ENTRANCES.

It is fastened to a treadle; I can put ten or twelve sections under the knife, come down with my foot on the treadle, and out come the entrances. I put them close together in the hives, mostly without separators, and I like them better than any dove-tailed sections I ever used; in fact, I never used but 1500 of them, of which 1000 were not worth one cent. I offered to return them by express, at my own expense, but the manufacturer came pretty near calling me a fool, by saying I did not know how to use them, and he would not have them back, and so I have gone back on him. Now about those

### FOREST LEAVES FOR WINTER COVERING,

that friend Hasty speaks about on p. 159, JUVENILE. I have twelve hives, with the upper story filled with leaves. After the long cold spell, when the mercury stood at from 12 to 16° below zero for a number of days, I went out to see how they were getting along. On taking off the cover I found the leaves on top frozen together. I said, "Well, well; this will never do;" and the way I went for those leaves was a caution; but before I got down far they were nice and warm — the bees in nice order. What surprised me most was that the hives were all alike, the leaves frozen together on top; but after getting down two or three inches they were dry and warm, and the

bees in good order. I hear of losses in different places, and think perhaps this winter will furnish a new supply of wax.

When I tell you that my bees, with the exception of the twelve packed with forest leaves, are in the same place, and in the same condition that they were in last summer, with no packing on top or sides, unless those with sections on can be called "packed," you will have some idea how I felt all through that long cold storm; but after it was over, and I went to examine them, when I lifted off the cover, out would come a "nose" to see who was meddling; and if they were hybrids, out would pop a bee. I felt better. I found them all in good condition. But, May is not here yet, so good-by until then.

WM. L. KING.

Sodus, Berrien Co., Mich., Feb. 23, 1883.

Thank you, friend K. If the demand were sufficient, we could supply veneer sections at about the price you mention, with something added for cutting the entrances, and for boxing. If I am correct, there is a trouble about molding, unless they are put up just about as soon as made. We have had trouble already with wooden separators in that way. Who can tell us more about it?—I am at present very much inclined to recommend forest leaves for filling the upper story of the chaff hives for winter; but unless the bees were confined below with a loose mat or wire cloth, I am afraid they would get up around the ventilators, and die among the leaves. Have you not had trouble in that direction, friend K.? With larger ventilating holes in the cover, I feel sure you would have got rid of all that ice among the leaves. See the following:—

#### DAMP CHAFF PACKING, AND THE REMEDY.

Bees did not have a good fly from time winter set in (which was about Nov. 15) till Feb. 16th. Mine are all in good condition except one, in a single-walled hive, which is very uneasy, and has the dysentery slightly. The rest are in Simplicity chaff hives, with inch holes in gables of covers. The single-walled hive had only a hole at one end of the cover, and consequently the chaff packing above the cluster was very damp—so much so that I changed the packing and raised the cover by putting nails under each corner. This shows the necessity of sufficient ventilation above the packing to drive off any excess of moisture. Holes  $1\frac{1}{2}$  or two inches in diameter would be better than one inch, the latter not being sufficient in my chaff hives to keep the chaff as dry as I would wish.

JOHN S. SNEARLY.

Williamsville, N. Y., Feb. 25, 1883.

#### MARKING THE HILLS OF FIGWORT.

C. C. Miller wants something to mark his hills of Simpson seed. A radish seed, or a grain of corn will do it in the spring; a castor bean in the fall.

#### PALMETTO HONEY.

You speak very highly of palmetto honey from our State. Permit me to give you my experience. I am situated in the pine woods, two miles or more from any other timber. Last spring was so dry that the fire swept over the whole country, and my bees were starving all through April. The palmetto was the first to blossom; I watched that and the bees very carefully. I could see the honey in the blossoms, but the bees did not work much, and the blossoms were covered with two thousand wasps and

flies to one bee. For three weeks it was the same, and in the hives but little brood was raised, and but little honey gathered, and that honey was all put around the brood in cells, lengthened with dirty brown wax. The end of the cells was turned up and not sealed; the honey was dark—bad-tasting and fermenting. Remember the fermented honey which Mr. Hart, of New Smyrna, spoke of in GLEANINGS a year or two ago. My conclusion is this, after two years of observation: The saw-palmetto honey is a myth, the bees never gathering any more of it than for immediate use; it ferments in the cells; is not eatable, and dark; also the wax made of it.

#### ANOTHER REPORT FROM GALLBERY.

But we have a bush, of which nobody has ever spoken yet, and which is our honey-plant par excellence. It is the gallberry, or evergreen. It grows 3 or 10 feet high, and blossoms profusely the second year after a fire, and regularly every year. The bloom is small and white; comes out at every leaf, and is succeeded by a round black berry the size of a pea, too bitter to be eaten by any thing; so much so that it will hang to the bush for a year or more. As soon as the first flower opens, a new life takes possession of the hive, which fills up in a few days. The honey in comb is snow-white when extracted; of a golden color, very thick and good.

#### SWEET POTATO AS A HONEY-PLANT.

Another good honey-plant is the sweet potato. When the bees work on them they have the spot you describe on bees which work on the touch-me-not, only it is of a pale yellow.

#### A HONEY-VINE WANTED.

Which is the best vine for blossoms and honey, and to cover a paling fence??

AUG. LEYVRAZ.

Palatka, Fla., Dec. 20, 1882.

#### BEES IN CELLAR WITH NO COVERING.

Mr. C. J. F. Howes, in his article on upward ventilation, page 186, Apr., 1882, gives my views almost entire. Last winter I put 3 colonies in cellar, with upper stories on. One had a covering over the frames, the others had not. Some time after, I thought I would fill the upper stories with chaff; but to my surprise I found the one that was "blanketed" had dysentery, while the others had a sweet smell as in summer; consequently I dispensed with the chaff, and those two wintered well, while the one that was covered dwindled till it had to be united with another.

#### CHAFF HIVES VS. CELLAR.

I have used the Root chaff hive for two winters, and think it by far the best way. I intend to winter all in chaff hereafter.

#### SEPARATORS.

My experience with tin separators has been, that the bees will work in the sections sooner without, and I have not had much trouble with crooked combs if starters were used.

#### FRIEND HUDSON'S FIRST SWARM.

Wm. Flickinger's report on page 299, June No., 1882, reminds me of my first experience with bees. My father bought 3 swarms, and gave me one. I was delighted at once, and used to sit for hours and watch them work. Sometimes they would alight on my face, and were so gentle I soon got the fever. The next spring I bought a swarm in a box hive for \$1.00; transferred them, and sold \$16.00 worth of honey in the fall (which looks small beside some of the "big bee-stories," as friend Bannon calls them, but was "big" in my estimation. M. L. HUDSON.

Charles City, Ia., Dec. 26, 1882.

## CHAFF HIVES, ETC.

I have 20 swarms on their summer stands; 15 in the Root chaff hives, and 5 well protected with chaff in hives of my own make. The bottoms of those five are a trifle damp, but the chaff hives are all perfectly dry. Give me all the chaff hives I need, and if my bees are in a proper condition in the fall I honestly believe that the wintering problem has been solved as far as I am concerned. I have 8 others in a small, dark, and well-ventilated cellar, doing very well so far. If chaff hives were ready for them last fall, they would have been quite as well off, with a great deal less handling. My report for last season is not worth a cent. We had plenty of flowers, but they would give no honey, except a little to keep the bees breeding. My stock in April was 17 good swarms; sold one in May, and 2 nuclei and several queens in July, and increased to 28, and got about 200 lbs. of honey; some in sections, and the rest extracted. To improve my stock I bought one of Mr. P. L. Viallon's selected tested queens, and also one of Doolittle's very best. I am well pleased with those two, although I had some excellent ones before.

THOS. C. DAVIES.

Pittsburgh, Pa., March 10, 1883.

## POISON PROPOLIS.

I am troubled with the propolis poisoning my hands. It acts the same as poison oak. What is a sure cure for it, or, rather, a sure preventive for it? The honey prospect is poor; too much wind and too little rain.

B. L. PRESSLY.

Santa Paula, Cal., March 1, 1883.

I am inclined to think that in your case, friend P., the bees have been collecting propolis from some poisonous tree or plant, for I never heard of such a case before. Has any one ever had a similar experience?

## UPWARD VENTILATION, ETC.

I had six hives of bees last spring. I had to feed in June. The last of July they got the swarming fever. I used up my hives, and I then tore down the queen-cells, and put the bees back. When frost came I had 17, some good and some weak. I thought I would try upper ventilation. I had two late August swarms, very small; they made some comb and some honey, but not enough to winter on. I left the slot in the honey-board open, and fed in the upper story; kept fed in all winter. They are all right now. Two that had no upper ventilation died. They were strong in numbers, and left lots of honey. I sold two; two died, and I have 13 colonies left.

WM. ALLHANDS.

Belmont, Cass Co., Neb., March 5, 1883.

## HONEY-BEARING HONEYSUCKLES.

Referring to friend Washington's report of the honeysuckle on page 135, March No., I will here say that we have on our grounds here several *Lonicera*, *Tartarica*, or Tartarian honeysuckles. This is an ornamental shrub which blooms in this climate during February and early March. The blooms are white, very fragrant, and our bees are on them all the time, just roaring. I presume friend W.'s is a wild variety, as our country produces several kinds, both vines and shrubs, from New York to Florida. They are increased by cuttings, layers, and seeds. While I look upon many of the family as "splendid bee forage," I am of opinion that they generally bloom too early in the season to amount to any certainty for this purpose.

R. C. TAYLOR.

Wilmington, N. C., Mar. 10, 1883.

## DRILLING FRAME-STUFF FOR WIRING.

I wrote I could drill a hundred frames in three hours [see p. 69]. As this was about the number I drilled after supper, I said three hours. I find, on further use, the machine does even better than I thought when I wrote, and I can drill about a hundred frames an hour. I, too, first tried a Morse twist-drill, but the 3-cornered point beats any thing I have tried. I have not broken the first one yet. I see you have the thickness of the slide to hold frames wrong; but I think if any one goes to make one he will readily see where the trouble is. It should be so the point of the drill comes in the center of the frame when the pieces are put on.

## FOOT-POWER BUZZ-SAWS — A SUGGESTION.

Tell the boys to put the balance-wheel of their foot-power saws in a frame by itself, like a counter-shaft. This gives a longer belt, can be more easily converted into a counter-shaft in case power is added, and if any cheap stout men are about, can help tread without being in the way. It takes up a little more room this way, but I think it is more than made up in other things. The saw I made several years ago, and afterward changed for power, so I could not replace the balance-wheel, I have recently rigged up in this way, and it does better than ever.

G. W. GATES.

Bartlett, Tenn., Feb. 21, 1883.

## REPORT OF THE FIGWORT, AND THE WAY FRIEND M. MADE THE BEES FIND THE HONEY.

I can't hold back any longer, for I want to tell you of those Simpson honey-plant seeds I got of you year before last. I sowed them, and about half of them came up, and my bees would not notice them; so last year I took them up and set them out in a little patch, and then the bees would not notice them. So I took some honey and poured on the plants, and in about one minute my little patch was loaded with bees. After this I had no further trouble, for the bees knew what I planted them for. I must say, they are a great curiosity; for I could see the large spots of nectar in the little flowers, and showed it to my wife.

J. P. MALE.

Pleasant Hill, N. C., March 2, 1883.

## CYPRIANS, AND THEIR ABILITY TO STAND EXPOSURE. THE WAY THEY WINTERED IN SPITE OF NEGLECT.

I shamefully neglected my apiary, consisting of 13 colonies of Cyprians, last fall and winter. They were left on their summer stand, some with supers on, and some with them off, without any protection. The winter was long and very severe; some time during which, the hogs got in and rooted some of them over, in which position they lay for an unknown length of time, with the caps off, and the frame in one jammed down together, and the snow drifted in on top of them. At this date they are all strong and vigorous, including the one hived on the fifth day of September last. I would add, that they all had an abundance of downward ventilation.

Jem, Mo., Mar. 14, 1883.

C. S. CALLIHAN.

Friend C., it is said that an "honest confession is good for the soul," and it may be it is; but even if your bees did come out strong, I should hardly want to advise that treatment. Very likely they had abundance of all kinds of ventilation, and may be that was what they wanted; but for all that I hope no one will think of copying your way of bringing it about.

## THE "POINSETTIA," AGAIN.

On page 123, March No., is an article on the new honey-plant (?), *Poinsettia pulcherrima*. Friend Holke writes that they would yield more than basswood. He also asks if any one has tried it. I have two plants in my conservatory, and observed, during January, the lovely drops of nectar oozing out of the seed-balls, and I was delighted over the looks of things as friend Holke when he went into that greenhouse. About a week after observing this, I conceived the idea of testing the relative merits of the blacks and Italians under a forced existence, as you might say. The result of this experiment appears in the March No. of the *Bee and Poultry Magazine*. The first thing I did after the bees got accustomed to their new quarters, and were working on syrup and artificial pollen, was to bring to their notice the wealth of honey to be found in that most beautiful plant with scarlet bracts. I took more than a dozen bees during the day and quietly placed their "bills" in contact with drops of nectar. They would insert their bill just once, and then wipe it off on their trousers, and walk away disgusted. During the whole time I had them in my conservatory (two months) I never saw them work on this plant.

JOHN ASPINWALL.

Barrytown, N. Y., March 16, 1883.

## FROM 16 TO 22, AND 1965 LBS. OF HONEY.

The first of May, 1882, I had 16 stands of bees, all weak, and the first of December I had 22 stands; sold 3 for \$20.00, and 4 went off; got 1215 lbs. extracted honey, and 750 lbs. in sections; have sold \$182 worth, and have \$40.00 worth on hand yet, besides what we have used, and that has been considerable. My bees are all Italians. I use the L. hive, and make all hives and fixtures myself. I was looking through my bees to-day. I find 4 stands dead. All have had the dysentery this winter. We have nice weather now, and bees are getting some honey from soft-maple.

W. L. MILLER.

Chariton, Ia., March, 1883.

## FROM 4 TO 18, AND 500 LBS. OF COMB HONEY.

Started in spring of 1882 with 4; increased to 18, and 500 lbs. comb honey; lost two; one starved, and the other froze. I shall have to double up two of them; that will leave me 15 in good order. They had a fine fly the 4th and 5th of March, and how they did carry off rye flour! I can get 12 colonies for 20 lbs. of honey each for one year. Do you think it will pay? I am getting all of increase.

A. W. SPRACKLIN.

Cowden, Ill., March 9, 1883.

I should take them, friend S.

## FROM 3 TO 9, AND 150 LBS. OF HONEY.

I began the season of 1882 with 3 colonies — 1 Italian of Hayhurst's stock, and 2 hybrids. Italians increased to 9 by natural swarming; 2 hybrids to 4. One swarm came off Aug. 20, and one Aug. 21. Both have plenty of stores to winter on. All are packed in sawdust, except two, which are in cellar. I sold three late swarms at \$3.00 each, and have taken 110 lbs. of extracted honey and 50 lbs. of comb honey in 1-lb. sections. No surplus till basswood bloomed.

## HOT SMOKE FOR CURING BEE-STINGS.

I noticed in GLEANINGS that one bee-keeper cures stings by the application of smoke, which cure, the editor thinks, is imaginary, or that the pain ceased through the imagination of the person. I think the

miud has an influence over the body; but last summer, when I had my thumb mashed with a foot-aeze, and eased the pain by holding it in the smoke of burning wool, I could not think it was imaginary, but real. A brother-in-law of mine, working in a sawmill, in turning down a log, ran the spout of an oil-can through his hand, coming out about the middle of the palm, giving him great pain. A neighbor came in and applied smoke from burning wool, which he said took away all pain in five minutes, and never pained him more. I have known it tried in several instances with much the same results.

Webster, Ind., Dec. 9, 1882. J. P. C. STEDDOM.

It would really look, friends, as if I should have to give up, that smoke does some good. Let us now, while we accept the facts furnished, at the same time apply to the matter the reason God has given us all. Is it really probable, that puffing smoke on the outside of the thick hard skin of the hand could have any effect in allaying the pain caused by poison injected deep into the flesh? I can not think the smoke alone has any such virtue, but relief may come from another cause. Some years ago I slipped off my mill that ran by wind power, and fell about 14 feet on to the frozen ground. The ankle received the shock, and it was so painful in a few minutes that I begged for chloroform. Several things were tried, but without relief, until a friend brought me a pail of hot water. It was tempered so it would almost scald; and as soon as my foot was dropped into it, the pain was gone. In half an hour I went to work, but kept my foot in hot water, changing as often as it got so cold the pain would come back. I have often thought this ought to be published, although I have never heard any satisfactory explanation from physicians respecting the matter. Now, then, friends, are you sure it wasn't the heat of the burning wool, or the blast of heated air, rapidly passing over the flesh so as to raise the temperature quickly, that did it? Of course, the remedy is none the less valuable; and now when you get stung, just heat up the place vigorously with a "hot-blast" smoker, and I shouldn't wonder a bit if it stopped the pain. Don't you think I ought to be among ranked scientists, and rewarded with a leather medal?

## HONEY THAT WILL NOT GRANULATE.

My honey does not granulate. That obtained from bees that died in 1880 was kept in an open vessel in the comb till fall, in a cupboard, then strained and put in glass fruit-jars, and some of it kept till we had new honey this season, and showed no graining. Honey that we extracted Oct. 5, what is left of it, has stood in stone-jars and pails, covered with shingles and newspapers, in a cold room. It is very thick, but shows no grains. I don't know what plant it is got from. Blackheart was abundant here last fall also.

M. E. KNOWLTON.

Sanneman, Illinois.

## WIRING FRAMES—ANOTHER "KINK."

Some of your correspondents would like a device, to be used instead of the holes for wiring frames. This is the way I do: I take 3/4-inch wire nails and drive them through the top and bottom bars, where the holes should be—the heads on the outside. Then with a pair of small round-nosed plyers turn hooks

on the point end of the nails. The time gained in hooking the wires on, over that needed to thread them through holes, is more than equal to the time required to put in the hooks. E. S. EASTERDAY.

Nokomis, Ill., Mar. 7, 1883.

I declare, friend E., I don't know but that you are right, for the nail-heads along the top-bars would not disfigure it at all. I will have our girls try it, and report.

FROM 1 TO 4, AND 125 LBS. OF HONEY, ONLY.

I can not make my bees "store up" honey like the rest of you bee-raisers. It does seem to me that you all can make your bees store up as much honey in a couple of weeks as mine would in a whole season. I'm almost ashamed to tell you, that last spring I started with one hybrid stand, and the increase was three good swarms and 125 lbs. comb honey, and each hive well filled with honey and bees for winter. That was the best I could make them do. A. COREY.

St. Marys, Auglaize Co., Ohio, Feb. 16, 1883.

Well, it is *really* too bad, friend C., that you couldn't make your one swarm of bees do any better than to give 125 lbs. of honey, and increase to *four strong colonies ready for winter*. Suppose you had a hundred, and did as well with all of them, where would you be?

STARTING NUCLEI BY MOVING A WORKING COLONY, ETC.

I started last spring with 10 colonies and increased to 23, and secured about 375 lbs. surplus, all in 1-lb. sections. It was a very poor season, and the box-hive men (the bees around here are all kept in box hives, except mine) secured no surplus honey at all. About the first of June I moved a strong colony of blacks, and set an empty hive in their place, giving a comb very full of young larvæ and eggs from an Italian queen. There was quite a flow of honey at the time, from locust. They started two queen-cells, and filled nearly every other cell with honey, covering up eggs and larvæ. They had plenty of sheets of fdn. at the time. I moved another hive in the same way later, and gave them a comb of larvæ and eggs from a very bright swarm of Italians, and they raised a queen whose bees are pure black, as nearly as I can tell. I have never seen the queen. Can they be hybrids, or did the old queen come back? Will friend Doolittle tell us how many feet of comb and brood he gives his bees when he crowds them up to put on his sections, and have them store honey enough in the brood-chamber to winter on? J. WOOLSEY.

Bedford, N. Y., Feb. 26, 1883.

If the queen was reared from pure Italian brood, the bees can't very well be black, friend W. I think some young queen must have got in. The old queen could not very well get there by moving the hive.

FRIEND KEPLER AND HIS NEW OPENING-UP IN TEXAS.

I have just opened 25 colonies of fine bees, shipped by freight from Chattanooga, Tennessee. They were closed up, and on the journey 10 days; all opened up in fair condition, without broken combs, and are now flying freely. I have settled on my ranch of over 1000 acres, and have a range over tens of thousands of acres of horsemint, clover, mesquite-trees, sensitive plant, broom-weed, sage, etc. Hoping to

be able to report better success in this "land of promise" than in the barren coal measures of the Cumberlands of Tennessee, I am yet hopefully,—

D. KEPLER.

Hubbard City, Texas, Feb. 26, 1883.

CALIFORNIA MOUNTAIN SAGE.

You advertise in your catalogue the seed of California white sage (*Salvia argentea*). Now, if Prof. Rattan, and the Geological Survey, "Botany of California," are any authority, the *Salvia argentea* never grew in California, at least no mention is made of it. The "white sage" which has built up the reputation of California honey, is not a true sage, but it belongs to the genus ranking next to *Salvia* in botanical character. Its true name is *Audubertia polystachya*. A close relative, the *A. stachyoides*, ranges further north, and is but little inferior for honey. Quinby's New Bee-Keeping makes the mistake of saying, that "in California the main dependence is on 'white sage' (*Eurotia lanata*)", page 61. *Eurotia lanata* is a dwarf plant growing only in alkaline soils in the extreme northern and eastern borders of the State. It is useful only as stock forage after other resources are checked. It is sometimes called white sage, and sometimes "white fat."

ANDREA NORTON.

Gonzales, Monterey Co., Cal., Feb. 18, 1883.

Thanks, friend N. All I know about our sage seed is that it was sent us from some of the bee friends who have the sage honey, and therefore I think the seed is right, even if the name is wrong. Will Profs. Cook and Lazenby please help to set us right in the matter? and will some of the friends in California please mail them samples of the sage that bears the honey? I presume there will be no trouble in getting both leaves and flowers now.

BLUE THISTLE.

I see by some of the late numbers of GLEANINGS, that some are apprehending danger to the farming community by the introduction of blue thistle. I am not in favor of introducing dangerous plants; but I must say, from past experience I apprehend no danger from this plant. It made its appearance here more than thirty years ago, and is one of our best honey-plants. I had about 7 acres of it the past summer, from which my 20 colonies of bees gathered about 600 lbs. of section honey with pure white capping and excellent quality, bringing 25 cents per lb. Besides my own, there were 40 colonies of bees belonging to another apiary working on it. Sumac is a good honey-plant here, but takes double the labor to get it out of the land that blue thistle does.

AMBER SUGAR-CANE.

The package of seed I purchased of you last spring I planted on the 6th of June, and got a good yield. There were three stalks that grew among it with seed like that I inclose, which ripened about a week in advance of the other. Are you acquainted with this variety? And will the seed raised here deteriorate too much in one season for planting, or will it do for several years? I tried the plan recommended in GLEANINGS for clarifying with clay, and some others: found clay the best. J. W. WALKER.

Greenspring, W. Va., Feb. 27, 1883.

I do not know any thing of the early variety you found, friend W. Northern-grown seed is preferred by some, when it is well ripened. Thanks for item on blue thistle.

## CEMENT AROUND THE ENTRANCES.

I have been trying for some time to think of something cheap and substantial to keep the grass and weeds from growing around bee-hives. How would cement do? have you tried it? it costs only about \$1.00 per bbl., and I should think one barrel would answer for several hives, by scraping away the grass and putting down a thin layer. If you think it worth trying, let us hear from you through GLEANINGS.

JAS. ERWIN.

Gainsville, Ky., Dec. 14, 1882.

Cement was long ago suggested, friend E., and, if I am correct, tried to some extent. Would not the frosts of winter break it up? We rather give the preference to clean white sand.

## BROOD-REARING IN WINTER; DYSENTERY, ETC.

The bees will be very scarce here in the spring. I know of one man who has lost 9 out of some 20 hives, and others that are losing more or less. I have lost one stand up to the present, and have three others that are diseased. I can not account for their getting diseased altogether. I think sometimes it is caused by brood-rearing. The hive that I lost has been trying to rear brood all winter, and it has been so extremely cold that the brood would chill in the best of cellars here, when the thermometer stood at from 30 to 60° below zero. I think that the brood dies; then it sours, and begins to taint; and, as a natural consequence, the honey and pollen around the brood become stale; and as it is consumed first, I think it generates disease and dissatisfaction in the hive, and makes the bees noisy, and they eat the more; and if you ever noticed, the bees commence to move from comb to comb, and eat every thing before them until they get full and almost rotten, and then fall off and die.

## LATE, THIN, DARK HONEY NOT NECESSARILY PRODUCTIVE OF DYSENTERY.

I have one swarm that came off the 20th of August. I put it into a hive without any comb or fdn.; it filled the hive partly full of comb and thin black honey, and I thought I would see how it would winter without any feeding. I put it in the cellar, and have kept it clean and nice, and there have been the fewest dead bees under it of any hive I have in the cellar.

J. E. LAVIS.

Mill Creek, Wis., Feb. 14, 1883.

Your idea has been many times suggested, friend D., and no doubt you are at least partly right. Brood-rearing, and its attendant consumption of pollen, is without question one great cause of dysentery, and I believe we are pretty well agreed that bees winter just as well, at least, without pollen. We are glad of that experiment to show that even late dark honey may winter bees safely. I presume this hive did not have any pollen, or at least very little.

For several years past I have kept bees on a limited scale, and find it to be a pleasant and remunerative business here in Texas. I generally obtain 100 lbs. per colony annually, from black bees. But while my bees are doing well, my health is on the decline, and I must seek a milder climate.

## HOW FAR MAY SWARMS GO?

It has become a question among my neighbors, as to the greatest distance that bees will travel after swarming, in search of a suitable place to locate. Two of them have captured swarms of Italians clus-

tered near their premises; and it is an evident fact, that at the time there were no Italian bees owned within less than 18 miles of either of the lucky parties. It appears from the above, that bees will sometimes fly many miles away to seek a new home.

## WHITE POLLEN.

In the month of January, for two years past, my bees have gathered a beautiful white substance that has every appearance of pollen; but at that season of the year there are no flowers in bloom. Where they obtain it is a mystery.

Honey in our home market is worth from 12½ to 16 cts. per lb., in good shape. My entire experience has been with the black bee; but if I emigrate to Florida I shall stock up exclusively with Italians.

J. H. HOLYFIELD.

New Boston, Bowie Co., Texas, Mar. 4, 1883.

It may be, friend H., that bees fly as far as 18 miles; but I should be very doubtful about it until it was thoroughly proven. Are there no forests where the Italians could have located and sent out the swarms you mention? You know they often send out a swarm only a few months after they have swarmed.—Is not the white pollen simply flour that they have stolen from some neighboring mill, or other similar source?

## TWO QUEENS IN A HIVE, AND BOTH FROM ONE LOT OF CELLS.

Is it not an unusual thing, in cases where two queens are found in one hive, to find them from the same batch of queen-cells? A friend has a hive which became queenless in June, and remained so despite my best efforts to requeen it, till the 22d of August. It then had a laying queen which was only 5 days old. A week afterward my friend saw a very handsome queen emerge from the hive, and, after a five-minutes' flight, re-enter, then emerge again after ten minutes, and after fifteen minutes re-enter. A month afterward I found two queens in the hive. One was quite dark, and her wings were quite dilapidated. The other was a fine large yellow queen, and was doubtless the one which my friend had seen taking her wedding flight. I have heard of old queens which have become somewhat enfeebled, allowing a daughter to help them in their peculiar duties; but I do not remember to have heard of two queens, from the same batch of queen-cells, living in harmony in the same hive.

JAMES MCNEILL.

Hudson, N. Y., Oct. 9, 1882.

A few such cases have been reported, friend M.; but from your description of them when last seen, I should still be inclined to think, by some chance or mishap, they were mother and daughter, after all.

## FROM 78 TO 130, AND \$650 WORTH OF HONEY, AFTER ALL EXPENSES WERE PAID.

I started the season with 78 colonies of hybrid and pure Italian bees; increased to 155 by natural swarming, except building up 10 nuclei; did not accept any after-swarm; all were returned to old colonies; there are now 130 colonies in cellar, and the rest are chaff-packed on summer stands. I made 4000 lbs. of white-clover honey, all in 1-lb. sections, and two barrels of mixed extracted honey, about 700 lbs.; all is sold but one barrel of extracted; the whole, after the expenses are taken out, has netted me \$650. I have 3000 sections filled with comb (from which I extracted the mixed honey), for use another season.

W. ADDENBROOKE.

North Prairie, Wauk. Co., Wis., Dec. 6, 1882.

## POLLEN AGAIN, AS THE CAUSE OF DYSENTERY.

Hearing that you and many other prominent bee-keepers, through journals, recommend sugar syrup to winter bees on, as it keeps them from getting the dysentery and spotting the hives, I gave it a thorough trial for two seasons, and think there must be a mistake somewhere. I have had them spot the hives quite badly, after making it a point to extract every drop of honey from them very late in the fall, after all honey had ceased altogether, feeding in its place 21 lbs. of the best A No. 1 granulated sugar syrup to each colony. The sugar syrup has a nice body, having been brought to a boil, and skimmed; and the syrup that is in the hives now is as sweet as when it was fed to the bees, and it has not candied any, it being about like honey itself. The bees appear to be in excellent condition, the colonies all being strong; and for the hives, they were all new chaff hives last summer, and are nice and dry now. How can you account for it? But I think I have found out where the trouble comes in. I think it is all in pollen. I may be mistaken, but it is my opinion that, in a prolonged cold spell, the bees will eat pollen before they will leave the frames they are occupying, as most hives will have honey or syrup stored right over pollen in the same cells. I have just examined some of the combs that prove my assertion most clearly (that bees eat pollen); and the trouble is pollen, and not sugar nor honey. The trial this winter was with 15 colonies. They had pollen, but no honey. Bees are doing nicely now. It is the first day for them to carry pollen, and they are carrying fast.

## ARE BEES ABLE TO MOVE EGGS FROM ONE CELL TO ANOTHER?

I am experimenting with an observation-hive in the house, keeping the bees in bondage. I expect them to develop something new, as I am watching them very closely. I have seen the queen in the act of laying, come out of the cell (as if annoyed by the worker bees), with the eggs attached to her yet, not leaving any in the cells, when the workers would seize the eggs from her and deposit them in the cell for her. She did not fail very often; but when she did, the bees at once deposited the eggs in the cell. I watched the proceedings with a magnifying-glass, and am sure of what I say. The above is quite in harmony with my article in last-year's GLEANINGS on workers stealing eggs to raise queens with, as I claim to be the first to discover it.

## BEES KILLING HORSES, ROBBING, GOING ON RAM-PAGES, ETC.

Fifteen of my hives are not 6 inches apart (entrances facing one way), 5 of which are not a foot from the walk on which my wife, children, and visitors are constantly going to and fro, and the whole 15 are not more than 18 feet from three stables where horses are kept all the time, the nearest hive being only 6 feet from one of the stables, and whole is in quite a dense portion of the city, and I have the first complaint to hear yet. They gave me 8 swarms and 300 lbs. of extracted honey last summer, which was very nice, besides some queens I sold. Most of the colonies have your dollar queens, which turned out very nicely.

C. H. BEELER.

Philadelphia, Pa., March 18, 1883.

Very likely you are right, friend B., that with plenty of pollen the bees might have dysentery in spite of the sugar syrup, when plenty of pollen was in the hives. In our locality very little pollen is wintered over.

Suppose you try, next time, clean combs and sugar syrup.—I believe it is generally accepted, that bees have the ability to move eggs; but, friend B., are you not mistaken about being the first to suggest it? It was talked of many years ago.—Your bees have behaved well, it is true, and I believe they do generally; but suppose they get to robbing some grocery and get well stirred up and demoralized; I think you need to be pretty careful in such a locality.

## WANTED, A RECIPE FOR MAKING HONEY VINEGAR.

I have nearly four volumes of GLEANINGS, and the A B C; but I can find no recipe for vinegar, only that honey will make excellent vinegar. There is one in "Honey as Food and Medicine," but I don't want any thing to do with whisky. I think it can be made without that.

R J. FOX.

Natick, Mass., Feb. 21, 1883.

I have noticed at the conventions recently, very pretty samples of honey vinegar, and doubtless these friends will be quite willing to tell how it is made. Let us hear from you, friends. Bee-men never keep their light under a bushel.

## FROM 7 TO 28, 35 GALLONS OF HONEY, AND \$128.80 IN MONEY.

Last spring I commenced with 7 stands; increased to 28. The last swarm came out the 15th of September. I sold it in the fall for \$7.50. It is in good condition at the present writing. I extracted about 35 gallons of honey, and had considerable comb honey. I lost five during the winter. I sold 20 stands the 24th of Feb. One stand brought \$9.00; 2 brought \$7.00 apiece; one \$6.00; five \$5.70, and eleven \$5.80 apiece. It was a very stormy day on which I had my sale, or I should have done better. I intend to change my place of residence, hence the sale of my bees. I like to handle them.

REV. JAMES M. REES.

Lenox, Taylor Co., Iowa, March 5, 1883.

## A NOVEL BIRD-HOUSE.

If you or any others who bought any of my dipper-gourd seed last spring have more gourds than is needed for dippers, just hollow them out as you would for dippers, only cutting a smaller hole, and then hang them up on your apple-trees, out-houses, etc., by driving a couple of nails through the handles, and let the blue-birds, wrens, etc., take possession of them. I used quite a number in that way last spring, and when the young birds peeped out it looked "too 'cute for anything," as the girls would say.—Bee prospects look blue in this vicinity; about equal to two years ago. Cause, starvation, as there was no fall honey gathered to amount to any thing.

S. P. YODER.

Vistula, Ind., March 13, 1883.

## DEVELOPING YOUR HOME MARKET, ETC.

Last spring I had 43 colonies, all in box hives. They did nothing to speak of until after the 4th of July. Some colonies were killing drones the 5th of July. The colony that I noticed killing drones the latest in the season made 115 lbs. of box honey. Ten colonies gave me 847 lbs., and my whole crop was 2000 lbs. I increased to 57 good strong swarms, and sold about all my honey at from 12 to 16 c. per lb. net. I have been much benefited this season by the advice given in GLEANINGS in regard to finding a home market, and not shipping to commission men. As

soon as my honey was off the hives I began trying to obtain the names of responsible grocery men in nearby towns, and wrote to them, stating the kind of honey I had, the weight of a crate, and the price at my place. I had orders enough from those men to take all my honey. I am still receiving orders for more, and at an advanced price, but no honey to fill them with. Every man who ordered a sample crate has ordered more. Not one found a word of fault with the honey sent them. I mention the last, because I think it very important, in sending honey to a groceryman, to send nice clean boxes, well filled, packed in good neat crates; and if there is more than one tier of boxes packed in the crate, one above the other, there should be two or three thicknesses of newspaper placed between the boxes, so that, if one of the top boxes leaks, the honey will not daub the boxes below. THOS. ROTHWELL, 67.

Austinville, Bradford Co., Pa., Nov. 27, 1882.

#### "SQUARE MEN."

Many dealers in honey and apiarian supplies fail to fulfill their contracts, and I have a list of them which I had thought of sending you for publication; but upon further reflection I concluded that it would be better to send the names of those who do fulfill their contracts to the letter, and more too. Chas. F. Muth writes to one of our apiarists (Oluf Olson), "Your honey is first-class, and compares favorably with the best Northern honey. I have concluded to give you ten cents for it, instead of eight, as agreed upon." All who have dealt with Mr. Muth speak of him in terms of the highest praise. So also of Merriam & Falconer, Jamestown, N. Y. Now, friend Root, is this not the better way,—give praise to those deserving of it, and those who are not, give them a most severe letting alone? Will not such a course be an incentive to others to be more upright and honorable in business? "*Exempli gratia.*" GEO. J. ALDEN.

New Smyrna, Fla., March 12, 1883.

#### POINSETTIA IN ITS NATIVE HOME.

On p. 123 there appears an article about honey from *Poinsettia pulcherrima*. Friend Holke is getting pretty enthusiastic over it; but I am afraid he will look in vain for any poinsettia flowers in summer. The poinsettia blooms in Mexico, where there is no winter. They are an exceedingly beautiful sight when in full bloom in a greenhouse. They bloom about Christmas time and New Year's. The drop of honey is quite large, and is not an accidental phenomenon. They produce only one crop of flowers in a year. Ants are very fond of working on them. F. HAHMAN, JR.

Philadelphia, Pa., March 7, 1883.

By referring to page 123, it will be seen that the plant in question was incorrectly printed *Poinciana pulcherrima*, for which we beg pardon. It should be read as in the heading; but we trust the honey will be equally sweet in either case.

#### WINTERING UNDER A SNOWDRIFT.

I have kept bees for four winters, and have tried the cellar and the summer stand, but have lost more or less every winter. Last fall I placed my hives along a stone fence running north and south, on the east side, where they drifted under the snow very evenly, and there has been two or three feet of snow over them all winter. A few days ago I examined them and found them in splendid condition.

They are the strongest and brightest I ever saw. In the spring the snow had melted away from the sides of the hives for a foot, but it was solid over the top till a warm spell a week ago; then it thawed so that I could get the cover off to examine them. I had 6 inches of chaff over the frames. The top of the chaff was damp, but the bottom was dry and very warm. There has been considerable loss in bees in this section where they were in single hives with no protection.

#### ANOTHER HIVING-BAG.

I was looking over the different arrangements for hiving bees, but see none like mine. I take open cloth, cheese-cloth is best, and make a bag a little larger than a two-bushel grain-bag. I place two hoops in it, one near the bottom and one about the middle. To keep it open at the top I put a pair of wire jaws, like a valise or carpet-bag, with hinges at the corners, then sew the bag to the jaws, and it is ready for business. Where the swarm is on a small limb I put a ladder as near to the swarm as I can, then take my swarming-bag, take a jaw in each hand, and open it over the swarm and the limb it is on; clasp it together, and give the limb a shake. You can draw it off the limb, or clip the limb off with your knife. You can now clasp the jaws close together, and hang it in the shade while you look after another swarm before you give them. I have one that is fixed on a couple of poles 12 feet long. The poles are fixed to the jaws like a pair of tongs. I can reach the bag up to a swarm, clasp the jaws over it, give the swarm a shake, and draw it off the limb, and get almost every bee.

Clarkston, Mich., March 20, 1883. H. FLEMING.

#### FRIEND WALKER'S "DOUBLE GIFT."

In reply to your question, I would say that it is a new partner in our firm — she who used to be Miss Warren, and whom the school children (with whom she is a great favorite) still persist in calling "Jennie." She joined us about half way between Christmas and New Year's, being a sort of double gift, you see, and slightly changing her name; as a sort of mutual accommodation, she writes for me by direction, out of sympathy for "ye typo," during her spare moments, taken from her work as school-teacher and housekeeper. BYRON WALKER.

Capac, Mich., March 4, 1883.

You see I only asked him (very innocently) how it happened his articles of late are so nicely written, phrased, and punctuated, and the above is his answer. Friend W., may the time never come when you forget to thank God *daily* for such a "gift;" and as you value your own peace of mind, see to it that too many cares never make her old prematurely.

#### GETTING A START FROM A BEE-TREE.

I have kept bees on a small scale about five years. I found a bee-tree, and it had a good supply of honey and comb. I got an old bee-man, and he transferred them into a Langstroth hive. They did not swarm any that season (August), but wintered well in a dry-goods box packed with fine straw. The next spring I bought two stocks in L. hives; increased them to 16 hives; extracted about 400 lbs. of honey; wintered in cellar; lost all but 8, from not giving them upward ventilation. Last fall I put in cellar 21 stocks. March 11, I took out 20 in good condition. A. BRYAN.

Oskaloosa, Ia., Mar. 17, 1883.

## Ladies' Department.

**W**ELL, friend Root, I want to talk to you a little while, just as a scholar does to his teacher. On page 403, J. G. P. speaks of wingless bees, and you say that they are so because they have worn their wings out; but he says they are young bees, and I think he means bees that have never flown because they could not, as they did not have good wings to fly with, as that was the way with a good many young bees from my hive. They never had any wings to fly with. You ask in another place what it is that bee-keepers want to breed for. There are three points that I should think would be wanted. First, best honey-gatherers, as that is what they are kept for; second, prolificness; as the more bees there are, the more there are to gather the honey when there is any to gather. Third, gentleness. Am I not right so far? Who could want a larger swarm than that four-foot one, or larger yields of honey than we read of in GLEANINGS? and these qualities, with the gentleness of Italians, would, I think, suit any one. Perhaps a cross with the Italians and Cyprians, as this, you say, removes the vicious habits of the last named.

### GLOVES OR MITTENS.

Why not make linen *mittens* instead of gloves? Every woman could make her own, if she wished. I tried to work with gloves the first time I tried to handle my bees; but I soon took them off and rolled my sleeves up to the elbows, and I work that way whenever I handle them. All the stings I got was when I pinched one accidentally.

Some one (I do not remember who now) wants a carpet for the tin slides to queen-cage. I sent one to you that I thought would do. The paper was not very clean, but it was the only piece that I could find, of the kind I wanted. Why not put wax on all of the wood part of the cage?

MRS. CLARA S. LOCKWOOD.

Canon City, Grant Co., Oregon, Feb. 10, 1883.

### BEES IN WASHINGTON TERRITORY.

Oh! I think if you could only see our bees fly it would make you feel quite young and lively. It is the 2d day of March, with the thermometer 70° above zero; sun shining as warm and bright as in May. Grass and all vegetation is showing signs of life and activity. Our bees have been at work every day since the 25th of Feb. on balm-of-Gilead and willow, gathering dark-brown glassy-looking wax. Can you tell me what they do with it?

### FIREWEED SEEDS, ETC.

Now about this fireweed business. I am besieged on all sides for seeds; and as you have got me into the scrape, I think it only fair to help me out. The fireweed seed is exhausted until June, when it begins to ripen. Then I will save seed for all who want, if they will inclose a three-cent stamp; but I can not pay postage. Here is a man (card inclosed) who wants seeds or roots, but sends no stamps. The roots will cost 30 or 40 cts. postage; but he expects me to send them free, to advance bee culture! Do you think that is right? When I wanted seeds of honey-plants sent from Texas I paid 50 cents for 60 seeds, and was glad to get them at that; but they would not grow here after I got them.

MRS. NELSON KELLEY.

Ferndale, W. T., Mar. 2, 1883.

I think, my friend, the dark-brown glassy *wax* is propolis, although it seems strange to have them gather propolis so early in the spring. I am glad to know you have so pleasant a locality.

Do not be in haste to think evil, my good friend. I know the man who wrote you the card, and I assure you he will cheerfully pay for all he asks for. Very likely the friends are a little thoughtless about asking for seeds or roots; but where they know you have the seeds, I am sure they will willingly inclose the stamps needed. If they are not sure you have them, it would be quite natural to first send a postal of inquiry, as in the above case. Bee-men, as a rule, are fair and liberal, and *always* gentlemen. Are they not, friends?

### FROM 5 TO 16, AND \$87.00 WORTH OF HONEY.

As our loved one (our boy Homer) is gone, I will try to send a report of what the bees with his care did last summer. We had 5 stands in spring; increased to 16, and sold honey at 15 cts. per lb., to come to \$87.00. We new beginners have many trials. One of ours was bees gathering so fast that we had no place for them to store it, and Homer had to go to Striker, 18 miles distant, to get sections, which we buy in the flat, and he was to borrow Mr. Rogers' extractor; but as there was another man there to borrow it, he bought it, and had to give \$10.00. It is a very old one he had got of A. I. Root. We extracted 75 lbs. of honey. We buy our hives in the flat; bought 30 for one dollar each, and two wide frames with sections for each hive. This made \$10.00 more.

### BEE CULTURE FOR GIRLS.

Our daughter Alice, nearly 18 years old, is making the hives. She is to have half of every thing that she makes. She is to be our bee-keeper. You must send GLEANINGS to her.

MRS. M. C. ZELLER.

Pioneer, Williams Co., O., March 19, 1883.

We extend to you our sympathy in your affliction, my good friend.—Bee-keepers, as a rule, are not in the habit of classing floods of honey among the "trials;" but, on the contrary, the *trials* are when the honey doesn't come. We welcome Miss Alice into our ranks, and shall be pleased to hear from her.

## Notes and Queries.

### CHICKWEED POLLEN.

**B**EES wintered well; no loss so far. I wintered in 1½-story hive, with 2 inches of chaff on top.

First honey and pollen were gathered yesterday from chickweed. The day was pleasant, and I found some of my Italians over two miles away from home. The pollen from chickweed is a very dark brown.

W. A. HAMMOND.

Richmond, Va., Feb. 25, 1883.

### A HEDGE-PLANT WANTED THAT BEARS HONEY.

Can't you furnish me with hedge-plants of some sort that would be good for bees, and make a good cheap hedge-fence for a garden too, such as the Japan quince, or something else as good.

C. W. KENDALL.

Mooney, Jackson Co., Ind., March 22, 1883.

[Who can supply the honey-bearing hedge-plants?]

## VENTILATION.

Some who formerly wintered successfully have lost largely. I think they wanted more ventilating at the bottom. Some on the ground, with half the bottom out, are all right.

E. PICKUP.

Limerick, Ill., March 2, 1883.

## THAT PREMIUM LIST.

*Friend Root*:—Please say, at the head of the Tri-State Fair premium list that I sent you for publication, "Entries in this department are free to all."

A. B. MASON.

Wagon Works, Lucas Co., O., Mar. 19, 1883.

[The above was received too late to insert in the proper place.]

## THE CYPRIANS, AGAIN.

I had one swarm of Cyprians that gave 100 lbs. of surplus honey, and drew out 30 frames of foundation. They are the crossiest bees that I ever saw; the worst hybrids are gentle to what they are. Smoke only angers them. If any one goes closer to the entrance, they will fly out after him.

A. CARDER.

Hebron, Boone Co., Ky., Dec. 30, 1882.

## FASTENING BEES IN THEIR HIVES; A CAUTION.

While I was in Ohio in February I had three swarms in chaff hives melt down. Every comb went out of the frame. It was caused by closing up the entrance with wire cloth to keep them in.

Millington, Mich., Mar. 14, 1883. M. D. YORK.

[Thanks for the warning, friend Y. So many such cases have occurred, that I have always felt loth to advise fastening them in at any time of the year.]

## FROM 2 TO 7, AND 100 LBS. OF HONEY.

I forgot to tell you I started in last season with 2 hives of bees, and now I have 7. I think they are all well supplied with stores, and will get through the winter all right; at least, I hope so. I got about 100 lbs. of honey. All I know about bees I got by practical experience handling them last summer. I like to work with them. My experience so far with them encourages me in the work.

J. HELBER.

Farmington, Francois Co., Mo., March 8, 1883.

The two-frame nucleus I bought of you did well. I divided them, and have two hives; the first hive filled up in September more than full of honey. It contains two cubic feet of space. I drew the first premium at the county fair, and sold a 2-lb. section of comb honey for \$1.00. Comb honey retails here at 28 cts. per lb. There are no bees in this county, nor in three or four adjoining, except those I got of you.

C. C. BRIGGS.

Harrisville, Alcona Co., Mich., Feb., 1883.

## BEE-VEILS; ARE THEY BAD FOR THE EYES?

What is the effect on the eyes, of wearing a coarse bee-veil, like mosquito-bar? I was thinking, if my bees promise well this summer, of getting some of the one-piece sections of you; but does not Mr. Fornerook claim a patent on them? Or do you stand between your customers and all damages?

Otsdawa, N. Y., Mar. 19, 1883. THOS. DECKER.

[I do not think the use of a veil would be harmful, unless the eyes were weak and very sensitive. Mr. F. has for some time threatened to prosecute, and I am told is threatening yet; but my advice is now, as it always has been, pay no attention to his threats. If my customers should be so unwise as to pay money in answer to any such foolish demand, I should not want to be responsible.]

## FLOUR FEEDING.

Will you please tell me if it is best to place before the bees all the dry flour they will work up this pleasant weather?

## SALT WATER FOR BEES.

Also tell me if you feed salt in a weak solution. Out of 80 swarms I went into winter quarters with, I have now but 40 alive.

## CLEANING OUT COMBS.

Will the old comb need any renovating before using again? Ought the dead bees to be picked out of said combs?

MRS. DONNELLY.

Valmont, Col., March 10, 1883.

[As a general thing, give them all the flour they will take; but I would not let them get the combs too full of it, or it may harden in the cells.—We feed salt, a weak solution, when they seem to want it.—Set your old combs, one at a time, in the center of a strong colony, and they will take out the dead bees and clean them up. All these questions are answered more at length in the A B C.]

## The "Smilery."

WELL, friend Root, you may put me down in the Smilery, for my bees are all alive and in good shape. I have fed them for several days. I feed outdoors, plenty of rye meal and melted sugar, so all can have a chance; and 'tis wonderful to see the amount of meal they will carry away. I have 12 stands, and have taken 8 more on shares. They are also in good shape. That makes me 20 to start with this spring.

J. N. C. GRAY.

Atwood, Ill., March 7, 1883.

## Bee Entomology.

## Or Enemies of Bees Among Insect Tribes.

## A STRANGE BEE-ENEMY.

WE received by mail a bee-mole from William Little, of Marissa, Ill. He says it crawls into the hives, where mice can not go, and eats comb and honey and bees. We forwarded it to Prof. Cook, who says:—

The little mole-like animal sent by Mr. Wm. Little, of Marissa, Illinois, is not a mole at all, but a shrew or field mouse. It is closely related to the moles, and not to the common mice. Mice, rats, squirrels, etc., are rodents, or gnawers, which fact is evident in their peculiar chisel-shaped teeth. The shrews and moles are insectivorous animals and belong to the order *Insectivora*, while common mice belong to the order *Rodentia*. I have often heard of these shrews in Missouri and Illinois, as engaged in robbing the hives of the bees in winter. The little animals are so very small that they can sometimes push or crowd through a hole less than  $\frac{1}{2}$  of an inch in diameter. The little shrew sent by Mr. Little, measures only 1.75 inches in length. The color is brownish, the nose pointed. The anterior feet are slender, like the same in mice, and not fossorial, as in the moles, which are such expert diggers. This is a short-tailed mole, and is the *Blarina exillipes*. It is found from Tennessee and Virginia to Illinois, Missouri, and even south to Mississippi.

Its mischief can be prevented only by fencing it out. The perforated zinc would shut it out, and still permit the exit of the bees.

A. J. Cook.

Lansing, Michigan, Feb. 27, 1883.

## Blasted Hopes,

Or Letters from Those Who have Made Bee Culture a Failure.

FROM A REAL, LIVE, AND DESERVING "CANDIDATE."

WHEN one is a candidate for admission into Blasted Hopes, I suppose that a recital of his woes is the "open sesame" that gives him entry into that doleful company. When I read in GLEANINGS of the enormous yields of honey the "blessed bees" have honored some of my fellow-Texans with, I am convinced we have either the greatest honey country in the world, or the champion exaggerators of the age. I asked a friend who knows one of these "bee ranchers" well, how it was about Blank's big honey yarns. "Oh!" he replied, "he draws on his imagination for his facts, and his drafts are never *protested*."

Having had moderate success with bees in box hives for a number of years, I took the bee fever (and you are the man who gave it to me), and invested about *seventy-five dollars* in the business, and went at it "scientifically," "sorter." I increased last spring from 18 to 40, and sat down in the shade to wait for the profits. Being a patient man, I am waiting yet. I now have 25 colonies; my extractor is rusty for lack of use, and my disgust at the little winged idlers is so great that a wholesome dread of after-claps is all that prevents my kicking the hives when I pass them. Out of the queens you have sent me, I have only one left, and she is mother of as predacious a set of yellow rascals as ever vexed an apiary. They excite my admiration—sometimes, and *pointedly* too. Set a pan of scraps of comb down anywhere, and it will soon be covered with bees; but after half an hour there will be no bees around that pan but Italians, except a few black bees that have the very "solidest" reasons for remaining. Why, an Italian, to show his contempt for the natives, will alight in front of a black hive, and bite every bee that comes in. I wouldn't be at all surprised if they should take to waylaying the other bees, and just squeezing the honey right square out of 'em.

But I have not told of my success yet, or, rather, want of it. While the Navarro man and the Hallettsville man and others were getting seven or eight hogsheads of extracted honey from a single colony every week or two, I was moping around, my mouth watering for a single *bite*. I think if they don't do any better this year, I'll get out a writ of "rouster," and eject the last rascal of 'em. They are worse tenants than the "man and brother," for you can get a little rent out of the darkey—sometimes. When a man has to go round with his eyes swelled shut, his hands as big as hams, and his lip looking like a "damaged sausage," he feels that a little pecuniary solace would beat soda as an antidote for bee-stings.

We have had a very cold winter. This remark may not be original, but it is true, nevertheless. We had the thermometer 12° below freezing, twice. The fruit-trees are in bloom, as well as elm, wild peach, etc., and I see the bees are busy bringing in

pollen; but that doesn't interest me. I don't like pollen as a diet, and I can't sell it. Honey is what I'm after, and its rhyming friend—money. I have a mate for Meyer's "moth-trap-ketch-'em-alive hive," that rests in such inglorious ease in the fence-corner. Mine is not tenentless, however, although I have not sampled its sweets in going on two years. But my "jeremiade" is growing tedious. Adios, amigo.

W. P. LAUGHTER.

Morales, Jackson Co., Tex., March, 1883.

Very good, friend L. I am glad you got up and spoke your piece. Here is a \$5.00 bill placed to your credit for giving the boys so timely a warning, and for doing it in such a cheerful way too. Now don't borrow trouble, but just keep right on, let the bees gather pollen; and if you don't ere long have cause for rejoicing, we shall have a regular contributor for this department, and a good one too.

I have received the sample copy of GLEANINGS you sent me, and am well pleased with it; and from now on you can count me a regular subscriber. I have had some experience in bee-keeping, but not with so good reports as some of your readers have had. In Dec., 1878, I bought two stands of bees, and in April, 1879, they died. In 1880 I bought one swarm which swarmed two times, and the next winter they all died. I have spent \$25.00 for bees and hives, and have not received one cent in return. I think this will counteract some of the reports in your paper; but as I see my friends have done so well, I have resolved to try it again; and if I live till next winter I may report the results to you.

J. H. ROLWER.

Mt. Carroll, Ill., Feb. 26, 1883.

I thank you, friend R. When I first read your letter I was congratulating myself on having got a real good one for this department; but now I see that you have not been a subscriber until recently, and that spoils it all. You see, we want to get all of these dismal reports we can in here, from those who are right among our A B C scholars, and who are taking GLEANINGS right along.

I have had very poor success with my bees. I have now four stands alive, and in good shape; but I have taken but very little honey from them. I generally have to feed them more honey than I get from them. I have them in the Simplicity hive. I don't think that I shall ever succeed with them so as to have any such luck as some of them claim to have. It may be they make from one thousand to fifteen hundred pounds of honey from 4 or 5 stands, and increase to 18 or 20; but if they do, it is all right; but they look like "fish stories" to me. I have black and yellow bees, and they seemed to be very strong; but they can't carry such loads of honey as some of those fellows in GLEANINGS claim. Well, I will keep my bees just to see them around, and I will take GLEANINGS just to see how other folks manage their bees, and hear the yarns they tell about getting honey. So, send it along; and if I don't get honey I shall have bees and GLEANINGS.

GEORGE W. BROWN.

Anderson, Ind., Dec. 20, 1882.

Friend B. I should say you needed a fresh supply of all three of the Christian graces; viz., faith, hope, and charity. Do you not? Keep working, and hold on a bit, and you will soon see.

## Our Homes.

O righteous Father, the world hath not known thee: but I have known thee, and these have I known that thou hast sent me.—JOHN 17: 25.

OVER and over have I felt of late that those who ignore or oppose the teachings of Christ our Savior do so without scarcely comprehending or understanding what it is that they do oppose. Not only do they fail to comprehend what it is that Christian people want, or would do, but with a sort of unconscious perversity, if such a thing were possible, they go so very wide of the mark, and fail so utterly in recognizing the work that Christianity seeks to do, that even the contemplation of it seems sometimes awful. One little circumstance now comes to mind, to illustrate the point I wish to make. Several years ago, during Mr. Moody's labors, it was remarked that he on some public occasion prayed for the Spiritualists. It was said they were greatly offended at this, and proposed, by way of retaliation, praying for Mr. Moody. The idea they seemed to have of the matter was, that Mr. Moody would feel greatly hurt, or offended, in case they should turn around and pray for him.

In the first place, these people, it would seem, were offended because they took it for granted that Mr. Moody had, right in the midst of his prayer, a purpose of hitting a little clip at them, as he would have done had he been one of some rival political clique, or party, and that his greatest desire was to have his own party succeed. Again, they would have it that Mr. Moody would feel hurt, or offended, if they should retaliate by praying for him. They seemed to have forgotten, or perhaps had never heard, that Mr. Moody has, all through his ministry, constantly asked the prayers of praying people, nor did they understand that prayer is always for the highest good of the person prayed for, no matter by whom offered. Christ came into the world to bring "peace on earth and good will to men," and to make it plain, so that no one need misunderstand, the angels heralded forth the fact with voices from the skies.

A little over 400 years ago, people were content to live and die along the borders of a body of water, without any man being able to say what was on the other side of it; or, still worse than that, until the day of Christopher Columbus, no man was able to say whether or not there was any other side at all, and yet all that was wanting was simply to sail out of sight of land and explore; and this, too, while a temperate clime and fair and favorable winds offered every facility for such exploration. Just think of it, boys! If children then were like the children of to-day, we might imagine some inquiring youngster of less than a dozen summers saying,—

"Pa, what is there over t'other side of the big water?"

"I don't know, my boy."

"Why, pa, doesn't anybody know?"

"I do not think anybody knows, my son."

"Why, don't you think, pa, that there must be ground away over there, and that some kind of folks live there as we do?" How do you suppose the father could stand such questioning? I wonder if all the boys knew of it when it first began to be noised abroad, that a man had suggested the bold project of starting out with a fleet of ships, to see whether or not there wasn't something in place of nothing away over beyond that vast, dim, blue expanse. Did they have newspapers then, and was it the absorbing topic of conversation? Just think of it. But a few years have passed since then, comparatively, and yet just because there is a small spot around the frozen poles that man has not trodden, expedition after expedition has gone out, and many valuable lives have been sacrificed. In this case no one expects any thing like a new continent, or a new race of people either; but it is the furor for exploring unknown regions, and for knowing more of the earth on which we live. This thirst for knowledge is not confined alone to geographical matters either, but the whole realm of nature and thought is being ransacked in the same way. Every avenue that promises even a shadow of a chance for giving an insight into something we did not know before is canvassed in much the same way. Every year that passes witnesses some new element of nature called in to serve man; with electricity we have banished night; with the telephone we have annihilated distance, and muscular strength is fast being relieved by new machinery that makes hard labor a pleasant pastime, instead of a back-breaking drudgery.

Now, friends, is it true that all these great strides are confined to science and mechanics and travel? Has nothing been done in the way of making men better and purer, and more worthy of communing with God, who is truth and righteousness itself? I rejoice to think that something is being done in this very line. I feel sure there was never before a time when the profession of Christianity meant so much as it does at this present time. I feel sure, too, there never before was a time when only the genuine coin would pass current as is the case now. We are just beginning to learn that there are depths of wisdom in the teachings of the Savior that have never as yet been hardly glanced into, and that the unexplored regions lying there yet to be opened full to the light of blazing noonday are beyond any thing that has yet been brought to light in the realms of science. See here:—

Verily, verily, I say unto you, He that believeth on me, the works that I do shall he do also; and greater works than these shall he do; because I go unto my Father.—JOHN 14: 12.

Is not that a promise? Do you believe any one has yet sounded the depths of all there is in that little verse? What are the conditions, and how shall we do these works that are even greater than Jesus himself did? It is expressed in the little verse very plainly and simply. He that *believeth* on me. While I read the words over, there comes

that old feeling over me again, and I want to read them over and over. It is easy to say we believe; but our actions tell more truly than our words whether we really believe or not. When Moody left his situation in the shoe-store, and spent all the day long in laboring for the salvation of the street Arabs in Chicago, his actions showed he believed in the Savior. He knew these lost ones ought to be cared for by somebody. He knew that Jesus had said,—

For I was a hungered, and ye gave me meat; I was thirsty, and ye gave me drink; I was a stranger, and ye took me in; naked, and ye clothed me; I was sick, and ye visited me: I was in prison, and ye came unto me.—*MATT. 25: 35, 36.*

And he believed what he said was true. How wonderfully was the promise fulfilled in his case, in only a few months! He had, in his own rough, boyish way, sought first the kingdom of God and his righteousness, and most wonderfully had all things else been added. He had lost his situation, lost his money, and all his little earthly store. God remembered him, and money was poured down at his feet until he had to tell them he had no use for more, and asked them to take it away. Somebody has said that God is seeking opportunities to shower down blessings upon us, and lets them come just as fast as he sees he can do so, and not do us harm. When God saw that Moody was safe, that he trusted God, then could God trust Moody. He could trust him through great prosperity, and through great worldly praise. Are you sure, reader, God could trust you throughout the same?

God intrusted to Peter and John the power of working miracles. Is there a man living who could be trusted with such power to-day? Can you think of any one whom you know, any one that you have read of, who could be safely intrusted with the power Peter had to heal the sick, and not have it spoil him, and make him grow proud when it should be taken up and heralded right and left, as such a power would be nowadays? If the one who possessed this power fully believed in Jesus, believed in him more than he believed in the power of money or the power of fame and praise and renown, of course he would be safe; but who is there who would stand the test of such an ordeal? I have many times given a queen to a queenless colony by simply dropping her on a comb separated a little from the rest. The glad news of a queen in the hive would quickly spread, and in a very short time all the bees would join in a regular stampede from all parts of the hive, just to get near and touch, or take a look at the wonderful new comer. With the present intelligence and thirst for knowledge, I can readily imagine we might have about such a rush from both the Old as well as New World, should God ever again confer on one human being the power that Christ and his followers had. Who is there that, under such circumstances, could preserve a simple, unwavering trust and faith in God?

Have we any examples, at the present time, of great blessings poured out upon those who have or who do trust in God, or believe in the only begotten Son of God? We have, for one, Mueller, of England, who

commenced a few years ago asking God to send him the means for putting in practice his project of saving the orphans of that great city of London; and although he has never asked a copper of any one but God, in answer to prayer he has now received over four millions of dollars, and is at present almost a standing miracle, showing what faith and trust in God will do. His greatness is in his simplicity. His whole life is devoted and bound up in the care of those orphans, and his work seems to be very nearly in the line of that of our Savior while here upon earth. Mueller lives and works for them, having nothing of his own, and pleasing not himself, even as Jesus pleased not himself during his sojourn here.

Wm. E. Dodge, of New York, lately deceased, is another instance of a man who lived for others, and who was greatly blessed with means almost unlimited. Other cases are coming up, and becoming more and more frequent, of wonderful prosperity poured out to those who use it for the good of their fellow-men, until it really begins to seem as if the day were fast coming when all men shall agree that godliness is indeed profitable, and that selfishness and greed not only make their possessor unhappy, but by no means enable him to gain in the end in worldly store.

There is another great field for explorations, and I am sometimes inclined to think it is as plain before our eyes as was the great expanse of unknown waters before the eyes of our fathers. I am inclined to think, too, that as wonderful a new world lies over in that direction as Columbus found when he pushed out boldly, in accordance with his "belief." Columbus believed in land beyond the great sea, and his work showed plainly that his belief was sincere; so sincere that he *trusted* himself on the broad expanse of waters. The world did not know America then. Jesus said, "O righteous Father, the world hath not known thee." The world does not know God much better than the world then knew of that new land. When those who have had views of the new Jerusalem tell of it, the world will not then believe. Is it not so? Let us try a familiar little text:—

Blessed are ye, when *men* shall revile you, and persecute *you*, and shall say all manner of evil against you falsely, for my sake.—*MATT. 5: 11.*

How many believe this, as Columbus believed in his new venture? How many are willing to accept it, and trust their lives on it? It has been before the world for centuries, and almost all men have admired it and recommended it. Jesus said you are to do right; and after having done right, you are to keep quiet, look happy, and be happy. He said you must not worry nor be troubled, no matter how badly wicked people act. A young minister once said he wanted religion enough so that when folks lied about him he could feel happy over it. A kind of sad feeling comes over me when I think of this speech of his. It sounds more like the speech of a young minister than of an old one. Itsavors of the faith of a new-born soul. O God our Father, give us, give *me* that faith that will help us to rest trustingly on thy prom-

ises! Stephen had that faith. When they commenced stoning him, he, instead of stoning back, or instead of looking back on his persecutors, looked trustingly up toward heaven. God honored that look by causing the heavens to open before him.

And they stoned Stephen, calling upon God, and saying, Lord Jesus, receive my spirit.—ACTS 7: 59.

He lost his life; but what if he did? Life is a small matter, when you see the heavens opening ready to receive you. The stones were raining down upon him; but even while crushed, bruised, and bleeding, he looked peaceful and happy. With his last breath he prayed that the sin might not be laid to their charge. The natural man, and the world, would have called down curses upon the heads of those who so unjustly persecuted him; but Stephen knew Jesus, and believed in him as fully as Columbus believed in the bright new world when he saw it spread out before him.

Now, friends, there are greater things yet in the line of these little texts. Most of us think we have done a very commendable thing when we have endured persecution and abuse, and said nothing. The fires of passion may rage within; but if we hold on, and don't say a single word back, or at least not a retaliating word, we think we have been pretty heroic. If we go further than this, and disarm our angry persecutor by a pleasant look and smiling face, we think we are getting to be almost a saint. Well, it is a pretty good thing to be able to do this, and it almost always makes us feel happy, after we have fought such a fight; but to the one who so thoroughly believes in God and the Son, there is an experience far beyond all this. There is a point attainable by all Christians where trials and difficulties bring only greater happiness. Is this matter new to you? Read:—

Blessed are ye, when men shall hate you, and when they shall separate you from their company, and shall reproach you, and cast out your name as evil, for the Son of man's sake. Rejoice ye in that day, and leap for joy: for, behold, your reward is great in heaven: for in the like manner did their fathers unto the prophets.—LUKE 6: 22, 23.

There it is. When you are unjustly accused, when somebody tries to hurt you because you *are* doing right; when they from jealousy seek to wound you, instead of getting stirred up about the injustice of the attack, why, just be really happy, and even leap for joy. Do you say, "Mr. Root, why don't you do so?" Well, I am trying to do so.

I have got a view of that new world, just as Columbus got a view before he made a landing. I am working hard every day to get over into that promised land, and take all my family, friends, and everybody else along.

To be sure, there are conditions to these promises; and if we go back and look at the text, we find it reads that persecution must come, for the *Son of man's sake*. It must be for doing *right*, that the persecution comes. Wrong-doing brings trouble; but there are no promises for those who bring trouble on themselves by wrong-doing. Here is where the trouble comes in. The world tells the truth about us, and we get mad about it.

If there weren't a *particle* of truth in it we might leap for joy with a very good grace; but the sad part of it is, that we are almost always at least a little guilty; if we did not really do that with which we were charged, we were guilty of being seen in a company that did do such things, or something of that sort. Perhaps appearances were against us, and the Bible says we are to shun even the appearance of evil. You see that the whole matter turns back on us, and we are again faced with the importance of living better lives. When you hear some one complain bitterly of the corruption of the world, you can pretty safely assume that his own heart needs regenerating; or, to put it in another way, when you feel disgusted with the world in general you may safely set it down that wickedness and sin have obtained a lodging-place in your heart, and that the place to commence to reform in the world is right at your own door, with your own self. Isn't it a happy thought, that God has placed every thing so conveniently near to each soul who wishes to make the world better? Columbus had to raise money, and traverse great seas, before he could get a glimpse of the New World; but you and I can find it by not so much as looking over the fence, for that would lead us into our neighbor's garden; but we find it right in our own selves. "For the temple of God is holy, which temple ye are." When God's Holy Spirit comes into the heart the new world is found.

A great many people are troubled about what others do, or rather, perhaps, because they can't do right because others hinder them. I have told you how I once suggested to a minister when he was complaining that he had been misused, that we have a promise of a blessing when we are persecuted, and when people say all manner of evil about us. His reply was something like this: "Oh! to be sure, my young friend, this is all true, anywhere within the bounds of reason; but when people make asses of themselves, that alters the case."

Before I answer the above, I wish to state that this man was a marked exception to ministers in general; and although a man of ability, and many good traits, this one fault of his had led him into trouble all his life; but now to the question before us: What is a Christian to do, when people make asses of themselves, so to speak? Why, he is to be very sure that he does not make an ass of himself also, but rather, to show by our demeanor that we believe in the promises I have quoted, and that we are looking to God for guidance, waiting for him, it may be, to point out the way for us to act, and, above all the rest, should we show by look and act that we know God, and feel his presence near. If we do this we need have no fear at all of what the world may do; and, in fact, we have only one thing to fear in this whole universe, and this one thing is the perversity of our own hearts. "The fear of God is the beginning of wisdom."

Why, my friends, it is discovering a new world, and moving over into it, when we can realize that it is our privilege to stand

so near to God that no one can by any twist or crook crowd us away from him. I know I don't do it always, but I have beautiful soul-thrilling glimpses of that promised land now and then, and I rejoice to think that they come oftener than they did, as the years pass by. If it were not that it looked like boasting, I do not know but that I should like to say I haven't had a real old-fashioned spell of drawing down my face, and feeling cross and dismal, for a good long while. See how the little verse of my old favorite hymn fits in right here:—

Man may trouble, and distress me;  
 'Twill but drive me to thy breast;  
 Life with trials hard may press me,  
 Heaven will bring me sweeter rest.  
 Oh! 'tis not in grief to harm me,  
 While thy love is left to me;  
 Oh! 'twere not in joy to charm me,  
 Were that joy unmixed with thee.

You see, it sums up like this: If unjust persecution only makes you happier, the only *real* trouble you can have in this world is the troubles you bring on yourself by your own sins; and therefore, if your life is one constant effort to serve God, your life should be one constant day of peace and rejoicing.

Now, at the risk of having some one say I am bragging again, I want to tell you of some discoveries I have been making of late. One especially is a plan for making money. There is one funny feature about it, too, and that is, that there is no danger of so many going into it that it will be overdone. You might almost think I had something to sell, by the way I start out; but it isn't any thing to sell at all. It doesn't take any capital to start with. There, I have put my foot into it again, haven't I? for that is just the way all the circulars wanting agents read. Well, I can't help it if it does sound so, and so I will just go on and try to explain what I mean. We are working-people, all of us; we are in business of some kind. We are all working for somebody, or serving some one. With nearly all of us there is some sort of an agreement as to what pay we shall have. If there isn't such an agreement, there ought to be. Don't leave things loose, I pray you; have all the conditions well understood. More than that, make the best bargain for your services you can. I don't like any to work for me who don't care what they get. In one sense, I like to see people want lots of things. I like to see them want good pay too. Well, having got this all fixed, we are now ready for the secret, or for my little discovery, if you will let me call it so. It is to cultivate a feeling of love, friendship, and esteem for the one you are working for. If he isn't lovable, there is the greater discovery in store for you. If he is old and cross and stingy, you have some of the obstacles before you that Columbus had. You see, you have got something to pray about. Ask God, on bended knees, to help you to see something good and lovable in him whom you have perhaps almost hated. Now, don't let it be all talk and prayer, but let your actions show you feel all of this. If it is the man you sell your honey to, cultivate a feeling of gratitude to him for buying your honey. If it is a man who sells you

honey, such nice honey. Not only that, but study how you can do him little favors that you know will please him. Put it continually this way: "Well, now that is a real good sort of a fellow, and he has really paid me a good price for my swarm of bees; although he bought them just as they are, and didn't say a word about the paint being worn off the hive, I will just paint it over new, before I take it over." In every thing you do in life, get out of your own shoes, and try to stand in the other man's. If you enjoy fun or a joke, here is a wide field for you. Surprise every one you have deal with, by something of the kind he didn't expect. I don't mean you shall give presents, or give a man something he didn't pay for. You know I don't believe in presents at all. Just do every thing well you undertake to do. Where transactions come about that leave room for argument or discussion as to what would be just, fair, or right in the matter, rejoice because it gives you an opportunity of showing your customer that you do truly love him, and feel for his interests. Some of you may object to this advice, by saying you can't afford it. Why, my friend, I am giving it to you as a wonderful discovery for *making* money. Columbus would never have found the New World at all, had he not pushed boldly clear out of sight of land. Well, I tell you, you will make money by pushing clear out of sight of selfishness, and working for the interests of the other man with whom you are dealing.

For whosoever will save his life shall lose it; and whosoever will lose his life for my sake shall find it.—MATT. 16:25

When one has many things to sell, it is now customary to get out a price list of the goods. This price list is a common ground on which the buyer and seller meet. One asks so much, and the other agrees to pay so much. Well, when this price list comes into actual business, a great many unforeseen points come up that are likely to lead to difficulties and wrangles. The buyer interprets them to his advantage, and the seller, on the other hand, to his own interest. Now, suppose we reverse all this. Suppose the one who sends out the price list, after fixing his prices, welcomes his customers as he would somebody he was under obligation to, and to whom he was anxious to do a favor; suppose he said to himself, "Well, now, it would not do to give this kind friend things right out, but I will just study his order over, see how much the price list will allow me to do for him, in strict consistence with its readings." My friends, what do you suppose would be the result? Not only would his face beam all the day long with love to God and love to his fellow-men, but (other things being equal, mind you), his business would soon extend to every part of the civilized world, and all men would delight to do him honor.

I will mention only one more opening for exploring into this new world to-day. It is having more confidence in our fellow-men. I do not mean indiscriminate trusting of everybody who asks for credit, but I mean trusting people intelligently. How often do I see good honest hearts pained by harsh

ways and even words. I feel like saying, "Why, bless your heart, my friend, this brother would not for the world take a copper of your money." I take real comfort in telling such a one, "Now, look here, old friend, here is some money; just you take it and use what you need, and pay me whenever it comes handy." I know this is a little dangerous advice to give; for the one to whom you give the money must not only be honest, but wise and careful withal. Great harm may be done by using money unwisely. Here are a couple of sentences that came in a letter yesterday:—

I am astonished that you trust perfect strangers, in the manner you have me, with your money. You must possess unlimited faith in erring humanity.

My faith is in God, my good friend; and through good men, with honest purposes in their hearts, I see God. I felt satisfied, from the tone of the letter you wrote, that you were conscientious, and you see I was not mistaken. I know of the wickedness and sin there is in the world; but I know, too, thank God, that there is something godlike and noble in almost every breast. It may have lain long years unseen and dormant, but it is there still; and to us has God given the great and glorious work of lifting, cheering, encouraging, and helping each other.

I have declared unto them thy name, and will declare it.—JOHN 17:26.

## Tobacco Column.

### ANOTHER WITNESS.

**I** HAVE just finished reading an excellent work on tobacco, by Dr. Alcott, and send it to you by today's mail, thinking (if you have not already read it) that you might like to see it. I have been an inveterate smoker and chewer for a good many years. I have often felt the bad effects of the weed, but never tried to break myself of the habit until I began to read so much about it in GLEANINGS. I thought I would first try to break myself of the habit, and, if I succeeded, to let you know, as you seem to take so much interest in the cause. I think I can now safely say that I am cured, having not used tobacco in any form since the 7th of Dec., 1882. I will also say, that I feel 50 per cent better for having stopped, and I am going to try to get all of my friends to try the same experiment.

R. CUYLER.

Rapidan Sta., Va., March 11, 1883.

Thanks for the little book, friend C., and thanks be to God that you have succeeded so well in breaking away from the thralldom of tobacco.

### FRIEND ROSS' EXPERIENCE.

Twelve years ago this June, on the evening of the 1st of the month, all my family being in bed, I was going to have a good smoke; before retiring for the night, my eye caught hold of these words: "The effects of Tobacco." I read it through, and then took the pipe out of my mouth, and said, "By the help of God you never will go in again." I could not be clean in God's sight for using it; and the more I looked at myself, the filthier I was. I promised God, by his help, that I never would use it again, and he helped me through. It was 12 months before I got over it; in cold wet weather the smell of it

I liked, and still I would have to get up and leave where it was. I carried a small stone in my pocket for a year or more, and it was in my mouth the greater part of the time. But the Lord helps those who call on him, believing. I used it, I think, from the time I was 10 years of age. Bless God, who giveth the victory over all sin; for the use of tobacco is a sin, as much as cursing or drinking or taking the name of the Lord in vain. Do not think that there were no foes to face. I had to fight it out, and I conquered. When I caught a swarm of bees last August I thought, after reading "Quinby on the Bee," that I would use a little smoke; but then I said, bees can go where they came from, before I use the pipe again. You sent me a smoker. Friend Root, I do not think I am entitled to it, for doing what was right. I thank God that I have no more hankering for tobacco now than if I never used it.

The man who leaves off tobacco must watch and fight and pray; the battle ne'er give o'er; renew it every day, and ask the good Lord for help and strength to overcome all temptations, and he will, I hope, give it.

DAVID ROSS.

Ibatoon, Kan., March 21, 1883.

If this reaches you before you ship the box of goods I ordered, you can send me a Clark's smoker. I have concluded to give up the use of tobacco, after having used it almost incessantly for more than 20 years. If I ever use it again I will pay for two smokers.

S. L. TAYLOR.

Knob Noster, Mo., March 9, 1883.

### ONE WAY TO CELEBRATE THE INTRODUCTION OF A QUEEN.

I have been a slave to the weed for 21 years. I began its bad habit in the army, from hunger. We were out of rations for two days; but on August 28, 1882, I safely introduced my first Italian queen. I felt so big I took the tobacco and tossed it into the mud. I would not ask for a smoker, but I had bad luck with the one I got of you. The spring broke. I think a smoker as a prize will help me to keep the pledge; and if I ever use tobacco again I will pay you \$1.00 for the use of your smoker. I will do all I can to induce others to quit its use.

Somerset, Pa., Feb. 26, 1883.

A. H. HUSTON.

## "Remindery,"

Or Department for duties to be attended to this month.

**L**OOK out now for the bees. Very often more are lost from spring dwindling during the month of May, than any other month in the year. As we often have heavy winds at this season, a windbreak is very important. If they have not yet found natural pollen, I would feed them rye meal, or other substitute for pollen. If you are far enough away from other bees, I would also feed in open air. Manage it some way so no bees will be induced to fly out in unseasonable weather, and get chilled and lost. Every bee counts, now. If you feed outside, feed only as much as will be taken the same day, and that before night, or before it gets so cool the bees can't fly. We use the grooved board for open-air feeding. If other bees are near so you are obliged to feed inside of

the hive, I think I should use the Good candy. As bees often need water as well as feed, in some respects the very thin syrup is preferable. If the bees seem in any way feeble or diseased, I should use thin syrup made of granulated sugar. Strong, healthy stocks may be fed at this season of the year any thing they will take. Last year, during May and June, we fed large quantities of the poorest kind of maple sugar, without detriment. Unless the bees have a very large quantity stored in the hive, I should feed regularly at all times when they are not gathering honey from the fields. The reports for last year have been stronger than ever before in favor of heavy and regular feed. Many who fed clear along into July, with almost no hope of any honey crop, afterward secured wonderful crops.

Now to sum up, don't let your bees starve for lack of food; and remember that any kind of cheap food that they will take will answer for warm weather. Always endeavor to feed intelligently; that is, feed in such a way that the colony will be thriving, and building up a little every day; feed about as they get it naturally, to do most good.

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

**TERMS: \$1.00 PER YEAR, POST-PAID.**

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

**MEDINA, APR. 1, 1883.**

And whatsoever ye do, do it heartily, as unto the Lord, and not unto men.—COL. 3:23.

We have to-day, the 29th of March, 5052 subscribers, for which we are very thankful.

We are sorry to say, our engraver has not finished friend Muth's picture, so we shall have to keep it until next month.

### ALSIKE CLOVER-SEED.

We have an abundant supply of choice seed, which we can send by return mail, express, or freight, at prices as given in March JUVENILE.

MANY of the friends are ordering heavy goods by express; but when we send them so, they complain bitterly of the charges. Please bear in mind that heavy goods should always go by freight.

OUR A B C book is having a larger sale than ever before. An edition of 1440, although almost just out of the press, as it would seem, is so nearly exhausted that we are obliged to commence at once on another larger edition.

NOTWITHSTANDING the severe winter, the bees have wintered unusually well, as a general thing. A few, it is true, report heavy losses, but they are few comparatively. Among these few we shall have to be classed. Out of 185 prepared for winter in the fall, we have now less than 85 good colonies left. They didn't have a particle of grape sugar either, but they were all used for queening during the whole of last season.

WE shall, in a few days, have a large supply of Cook's new "Manual." It has been recently rewritten, revised, and enlarged. We can furnish it at wholesale and retail in any quantity. The price is the same as for our A B C book.

WE are getting wax so plentifully for 35 cts. cash or 37 cts. trade, that we are inclined to think further advances on foundation will not be found necessary. We have now over 2 tons of nice wax in stock, and more is coming daily. I am very glad to say so, for I do dislike advancing prices.

WANTED, SEEDS OF FIGWORT, OR SIMPSON HONEY-PLANT.

IF any of our friends have any of the above, please let us know at once what they will take for it. At present writing we can't report in regard to the roots, because they are not up yet. The frost is not out of the ground with us.

A GREETING to you all, dear friends! I am now speaking to you for the first time by means of the short-hand system, sitting back in my chair at ease, and gazing around the office in the meanwhile. All that troubles me now is, that it seems so easy that I fear I shall occupy too much space by talking too long.

IN making orders, please be explicit as to what you wish. A lady sent us an order yesterday, saying: "Send me boxes, with the necessary trimmings, for the \$15 00 inclosed." We presume she wanted hives; but the next question is, What hives? And as she wants the goods at once, delays and disappointment are almost inevitable.

### DOLLAR QUEENS.

FOR all received before the 15th, we will pay \$1.25 each. We will furnish them to the friends who wish to buy, for \$2.00, and we hope to send them by return mail, as is our custom. If any of the friends think the above too large a margin for taking risks, furnishing cages and paying postage, we are willing to let them try it.

OUR friend Geo. Grimm has recently ordered from this office the following, relative to candied honey. It is so "to the point" that we here insert it for the benefit of our readers. We can furnish these labels, gummed or ungummed, with your own name and address, for 75 cts. per 500; \$1.00 per 1000, or \$7.50 per 10,000.

**TAKE NOTICE.**—As manufactured adulterated honey can not be made to imitate the granulation or "candyng" of pure honey, granulation has been found to be the only ready test of pure honey. I therefore do not ship extracted honey before it is thoroughly granulated by cold weather; and I WARN every pound of honey put up and shipped by me to be absolutely pure honey as collected from the blossoms by the bees. To restore to the liquid form and retain its original honey flavor, set can in warm water and remove cover, but do not heat honey to boiling-point. Let cool before using. **CEO. CRIMM, Jefferson, Wis.**

### ODD-SIZED GOODS.

AS the busy season approaches, we have the same troubles again with odd-sized goods. For instance, a few days ago we received an order for 50 Simplicity bives, made to take American frames. In the first place, we had to sort the lumber to get boards of a different width from those we generally use. Then all the machinery had to be changed. After we got them all done, by mistake the rabbets had been cut in the sides instead of the ends. When it came to packing them up, the packers had trouble,

because they were unused to the odd sizes. New crating had to be cut for the packages; several delays and expensive misunderstanding; occurred, which would not have happened had we been going along with our every-day work. Besides this the lumber did not come out right, and a few more had to be made to make up the exact number required. A friend wanted a lot of frames the old-fashioned way—sawed pieces without dovetailing. As there was much less work on them, of course he would expect them to be made much cheaper than our regular goods. Now, our regular frames are made on machinery always kept properly adjusted, and the strips are sawed on a gang-saw, four pieces at a time. These for the special order being required of different thickness, must be sawed in the old way, one at a time. The result was, that the material for these frames, made of plain, simple sticks, cost us twice as much as our regular goods. Yet our customer will likely be displeased unless we make them at a less price, because they looked so much cheaper. Again: If any pieces are left they would be simply kindling-wood, made of good nice lumber, because we should have no possible use for the remnants. In making regular goods, of course there are no remnants. Do you see the moral, friends? and will you have charity when we charge you what seems to be exorbitant prices for making things to order after your own fancy?

### CONVENTION NOTICES.

#### WESTERN BEE-KEEPERS' ASSOCIATION.

The semi-annual meeting of this association will be held at Independence, Jackson Co., Mo., on the 4th Saturday (28th) of April, 1883, at 10 o'clock A.M. Papers prepared for the occasion by the President and Secretary and others will be read, and matters of general interest to bee-keepers discussed. A general attendance of persons interested in bee culture is requested. The present membership of this association control two thousand colonies of bees.  
J. A. NELSON, Pres't. S. W. SALISBURY, Sec'y.  
Wyandotte, Kansas. Kansas City, Missouri.

The Boone County Bee-Keepers' association will meet in the city of Lebanon, April 7, 1883.  
Whitestown, Ind. S. H. LANE, Sec.

The Central Michigan Bee-Keepers' Association holds its spring convention at Lansing, in the State Capitol Building on Tuesday, April 17, 1883, at 9 A. M.  
North Lansing, Mich. E. N. WOOD, Sec.

The Eastern Michigan Bee-Keepers' Society will hold its annual meeting in Detroit, April 3, in Abstract Hall, commencing at 10 A. M.  
Detroit, Mich. A. B. WEED, Sec.

The spring meeting of the Cortland Union Bee-Keepers' Association will be held in Cortland, N. Y., on Tuesday, May 8, 1883, at 10 o'clock A.M. in the rooms of the Y. M. C. A.  
McGrawville, N. Y., March 20, 1883. M. C. BEAN, Sec.

The Western Bee-Keepers' Association meets at Independence, Mo., Apr. 23, 1883.  
S. W. SALISBURY, Sec.

The Bee-Keepers' Association of South-Eastern Michigan will hold its spring meeting at Adrian (instead of Jackson), on Wednesday, April 13, 1883. All who are interested in bee-keeping, or are fond of honey, are invited to attend, or send essays, papers, or any implements useful in the apiary. The place of meeting will be announced in the local papers.  
H. C. MARKHAM, Sec.

Ann Arbor, Mich., March 15, 1883.

The Tuscarawas Valley Bee-Keepers' Association hold their next regular meeting at City Hall, Coshocton, O., on Wednesday, May 2, 1883, at 10 o'clock A. M. Come everybody.

Clarks, O. J. A. BUCKLEW, Sec.

### CIRCULARS, ETC., RECEIVED.

Dr. J. P. H. Brown, Augusta, Ga., has sent us a 20-page price list of supplies from the Pomona Apiaries, including bees and queens. Speaking of the new races of bees, friend B. says: "The Cyprian and Syrian (Holy-Land) bees are only varieties of the species *Apis Mellifica*. I have bred both these varieties, and have studied their physical characteristics and peculiarities, and am satisfied that the Syrian is the original typical bee of the species *Apis Mellifica*. In this I am not only sustained by sacred history, but also by the geographical distribution of the honey-bee."

F. A. Snell, Milledgeville, Ill., sends us a very pretty 16-page price list, 5½ x 3¼. Friend Snell is modestly presenting the Eclipse hive for public favor. He also deals in hives, extractors, etc.

E. Kretschmer, Coburg, Iowa, has mailed us his 18-page catalogue of bees, queens, etc.; 5¼ x 2¼.

W. S. Cauthen, Pleasant Hill, S. C., issues a 1-page price list of Italian bees and queens; 12 x 5.

W. W. Cary & Son, Coleraine, Mass., send out a 14-page list of Italian and Albino bees and apiarian supplies, etc. Friends Cary claim to be the "pioneer apiarians" of New England, and are certainly up to the times. The presswork is well done, which is more than can be said for the compositor's part.

J. I. Parent, Charlton, N. Y., issues a 4-page list of bees and apiarian supplies in general, excepting queens. Friend P. thinks hybrids preferable to either race pure, for his locality.

B. Davidson, Uxbridge, Ont., Can., sends us a 10-page list of hives, extractors, fanning-mills, etc.

Bright Bros., Mazeppa, Minn., have printed and mailed us a neat 20-page price list of apiarian fixings; 6 x 4.

J. P. Moore, Morgan, Ky., has sent out a 1-page list of bees and queens; 5 x 7.

Wm. Little, Marissa, Ill., sends us a postal-card circular of Italian bees.

James A. Nelson, Wyandott, Kan., mails a 4-page price list of queens, fdn., etc.; 3 x 5. Friend N. sends a piece of his fdn., instead of simply printing it.

T. S. Hall, Kirby's Creek, Ala., has sent us a nice 16-page list of bees, queens, etc., from his "Sand Mountain" Apiary.

C. C. Vaughn, Columbia, Tenn., has sent us a 2-page list of queens, bees, etc.; 8 x 5.

We have just printed for J. H. Reed, Orleans, Ind., a price list of bees, queens, poultry, etc.; 5½ x 3½.

G. F. Williams, New Philadelphia, O., has just received from our job rooms a 1-page price list of Italian queens and apiarian supplies; 11 x 7.

Oliver Foster, Mt. Vernon, Ia., is out with a 4-page list of bees, queens, fdn., etc. This also bears our imprint, and is 5½ x 3¼ in size.

S. D. McLean, Columbia, Tenn., has sent us a very pretty postal-card circular of Italian bees.

Wm. Ballantine & Son, Sano, O., have mailed us a circular of bees, queens, and supplies; 5 x 11.

J. H. Woodworth & Co., West Williamsfield, Ohio, have sent us their catalogue of bee-keepers' supplies; 8½ x 6½.

The Model Bee-hive Co., West Philadelphia, Pa., have sent us a postal-card list of apiarian supplies.

B. F. Carroll, Dresden, Texas, has mailed us a very neat 1 page price list of Cyprian bees and apiarian fixings.

MRS. LIZZIE COTTON'S CIRCULAR.

I am being asked my opinion of the new circulars Mrs. Cotton is again sending out quite plentifully. The statements she makes, and the prices she charges for the goods she sends out, would, in my opinion, forbid her being classed with our regular supply dealers, to say nothing of the strings of complaints against her that have filled our bee journals for years past.

**SEEDS!** 65 KINDS, 40c. Fine best varieties Cabbage, mixed in one package, 5c; also five best kinds each of Carrot, Cucumber, Lettuce, Onion, Radish, and Tomato, at 5c each; one large package of 30 choice kinds of Flower Seeds, 10 cts. Partics sending \$1.00 before May 15th will receive all the above by return mail, and one Italian Queen in July. Send for price list of Seeds. I also renew my offer in March No., which see.  
J. G. LEHDE, Gardenville, Erie Co., N. Y.

**BASSWOOD-TREES OF ALL SIZES, AND ITALIAN BEES EARLY IN THE SEASON.**

ALSO QUEENS AND BEES BY THE POUND.  
Basswood-trees, 8 feet, ..... 10 cts. each.  
" " 4 feet, ..... 6 cts. " "  
" " 2 to 3 feet, ..... \$2.00 per 100.  
" " 1 foot, \$1.25 per 100; \$8.00 per 1000.

Last charge; send for prices.  
3d A. W. CHENEY, KANAWHA FALLS, FAT. CO., W. VA.

### BOX-ELDERS.

From 6 to 12 inches high, \$1.00 per 100, by mail; 25 cts. by express; 12 to 18 inches high, by mail, \$1.50; by express, 40 cts. per 100.

MIL0 SMITH, Greenwood, Polk Co., Iowa,

THE NEW IMPROVED  
STEAM POWER

# Comb Foundation Factory.

**CHAS. OLM, Proprietor,**

| 10-inch, \$15.00.  
2ctd WM. C. PELHAM, Maysville, Ky.

## JUST OUT!

New Circular, and price list of Bees, Queens, and STENCILS for bee-keepers' use. 4-9d  
JOS. M. BROOKS, COLUMBUS, BARTHOLOMEW CO., INDIANA.

FOR SALE. 10 colonies of Italian and hybrid bees in American 9-frame hives, \$5.50 per colony, delivered at express office at Howard Lake, Minn.  
4d PAUL SCHLAGEL, Victor, Wright Co., Minn.

## HOLY - LAND AND CYPRIAN QUEENS AND Farm Implements!

I have a fine lot of pure Holy-Land and Cyprian queens which I will sell for one-fourth more than Root sells his Italians. Also a few pure Albinos; they are light-colored, and very gentle.

I keep on hand, and can ship from the factories where made, a stock of Farm Implements, a two-horse corn-planter, with drill attachment; one-horse corn-drills that will plant in hills; a steel-toothed harrow in three sections, with lever to clear from trash, or pass over obstacles; spring-tooth harrows; common harrows, with 40 or 50 teeth; sulkey hay-rakes; sulkey cultivators, plow-sulkeys, etc. Send for Circular.

H. B. HARRINGTON, Medina, O.

## 4-FRAME NUCLEUS.

I have so many orders booked for nuclei that I would urge those anticipating to order from me to do so this month, as I am afraid I shall not have enough bees and queens to fill orders promptly, if orders come in as they have lately.

4d P. L. VIALLO, Bayou Goula, La.

## Wanted to Exchange.

A hive of pure Italian Bees in Simplicity hive for FINE poultry of any of the following breeds: "Bolton Grays," "Scotch Grays," or "B. B. Red Games." Address

4d SILAS H. HICKOK,  
Bethel, Fairfield Co., Conn.

## 100

Colonies of PURE ITALIAN BEES for sale cheap. Queens all bred from imported mothers. Send for circular. C. C. VAUGHN, Columbia, Tenn. 4-5d

## FOR SALE!

200 or 300 colonies of Italian Bees in Langstroth hives in good condition. Price, single colony, \$6.50; 10 or more, \$6.00 per colony. Hybrids, 50 cts. less. I will guarantee safe arrival.

4-5d C. GRIMM, Jefferson, Wis.

## 1883. ITALIAN QUEENS! 1883.

Still they go! Bees for business now ready to ship. Order for our new circular of Queens, Full Colonies and Nuclei. It tells how to introduce queens.

4d T. S. HALL, Kirby's Creek, Jackson Co., Ala.

## BE SURE

To send a postal card for our illustrated catalogue of  
**APIARIAN SUPPLIES**

Before purchasing elsewhere. It contains illustrations and descriptions of every thing new and desirable in an apiary,

## AT THE LOWEST PRICE

Italian Queens and Bees.

1-6d **J. C. SAYLES,**  
Hartford, Washington Co., Wis.

BEEES AND QUEENS FROM MY APIARIES.

**HEADQUARTERS FOR**  
**Early Italian & Cyprian Queens.**

Imported and home-bred; nuclei and full colonies. For quality and purity, my stock of bees can not be excelled in the United States. I make a specialty of manufacturing the Dunham foundation. Try it. If you wish to purchase Bees or Supplies, send for my new Circular, containing directions for introducing queens, remarks on the new races of Bees, &c. Address  
1tfd DR. J. P. H. BROWN, Augusta, Ga.

**For Sale.** Colonies and Nuclei of Italian Bees, Queens, Extractors, Bee Books, and Supplies. Address OTTO KLEINOW, 3tfd opposite Fort Wayne, Detroit, Mich.

**FOR SALE!**  
QUEENS, BEES, COLONIES, COMB FOUNDATION, BROOD AND BROAD FRAMES, HIVES, SHIPPING - CRATES, HONEY - EXTRACTORS, HONEY - KNIVES, BINGHAM SMOKERS, PRIZE HONEY-BOXES, AND  
EVERY THING A LIVE BEE-KEEPER NEEDS.  
Send me an order and I will please you, I know.  
**F. A. SALISBURY,** 3tfd  
**GEDDES, ONONDAGA CO., NEW YORK.**

**ITALIAN** BEES, TESTED AND UNTESTED. QUEENS, SILK - WORM EGGS, ETC., ETC., NOW READY AT REDUCED PRICES.  
Circulars on application.  
3tfd CHAS. R. MITCHELL, Hawkinsville, Ga.

**Stanley's Vandervort Foundation,**  
**PURE ITALIAN NUCLEI,**  
**AND ALL SUPPLIES NEEDED IN THE APIARY.**

We are now prepared to furnish a large amount of our celebrated foundation, immediately on receipt of orders. This foundation is all made from choice yellow wax, and the workmanship is very fine, so that we feel sure that our goods will give perfect satisfaction. We are also agents for all kinds of Bee-Keepers' goods, and can furnish them as low as factory prices, and in some cases even lower. We sell the U. S. Standard Honey-Extractor at 10 per cent off the list price to all our customers who buy other goods of us. In addition to the above we have made arrangements so that we can furnish a large number of pure Italian Nuclei at greatly reduced rates. We will sell them with tested or untested queens, or without queens, as parties may wish. Those who wish to start an apiary the coming season should write and tell just what they want, and get our prices. Our nuclei will be built on full-sized L frames, and will be well stocked with brood and bees. In fact, we shall make the nucleus trade a business, and will give you a good trade in that class of goods. Heavy fdn., 50c per lb.; light fdn., 60c per lb. Five cents per lb. advance after April 15th; 1c discount on fdn. when ordered in 25-lb. boxes. Address 3fd

**G. W. STANLEY & BRO., WYOMING, N. Y.**

**Why not BUY YOUR QUEENS and BEES DIRECT FROM The Breeder?**

25 cents saved is 25 cents made. If you wish to purchase Italian Bees or Queens early in the spring, and wish a bargain, you should send for my new Price List. Queens ready in April. 3fd

Address **W. S. CAUTHEN, PLEASANT HILL, LANCASTER CO., S. C.**

**HIVES! CHEAP! CHEAP! HIVES!**

Having put in new machinery, and running exclusively on Hives and Supplies, I can give satisfaction on all orders on shortest notice. Send for price list and circular of Supplies for the apiary. 3fd

**A. D. BENHAM, Olivet, Eaton Co., Mich.**

**SOMETHING NEW, NOVEL, RARE, BEAUTIFUL, AND USEFUL.**

**PARLOR ORNAMENTS** MADE MICA. Wall-pockets, vases, baskets, OF brackets, horse-shoes, crosses, picture-frames, letter, glove, and handkerchief boxes; comb, card, and watch cases, etc., etc. For sale at low prices. Send stamp for price list to the only manufacturer, Miss Lulu Rogers, Cullowhee, Jackson Co., N. C. Will also furnish a cheap grade of mica for honey-boxes or observatory-hives. 4-6d

**J. H. WOODWORTH & CO.,**  
 MANUFACTURERS OF  
**SIMPLICITY BEE - HIVES,**

AND DEALERS IN  
**BEE - KEEPERS' SUPPLIES.**

SEND FOR PRICE LIST. 4 6d

**WEST WILLIAMSFIELD, - - - ASHTABULA CO., - - - OHIO.**

**HEADQUARTERS IN THE WEST FOR CYPRIAN ITALIAN QUEENS.**

Tested Cyprian queens from imported mother (Jones's importation), in April, \$5.00; in May, \$4.00; in June and after, \$3.00. Warranted Cyprian queens, in May, \$2.10; in June and after, \$1.50. Italian queens from imported mother (Root's importation), after 15th May, \$1.00. I have had experience in breeding queens, and guarantee satisfaction. Order now, and pay when you want queens. 4d

Address **W. McKAY DOUGAN, M. D., Seneca, Newton Co., Mo.**

**HEDDON'S CIRCULAR now READY**  
 Address **JAMES HEDDON, - Dowagiac, Mich**

**BEE - KEEPERS, ATTENTION!**  
 SIMPLICITY and CHAFF HIVES, SECTIONS, SMOKERS, ETC., ETC.

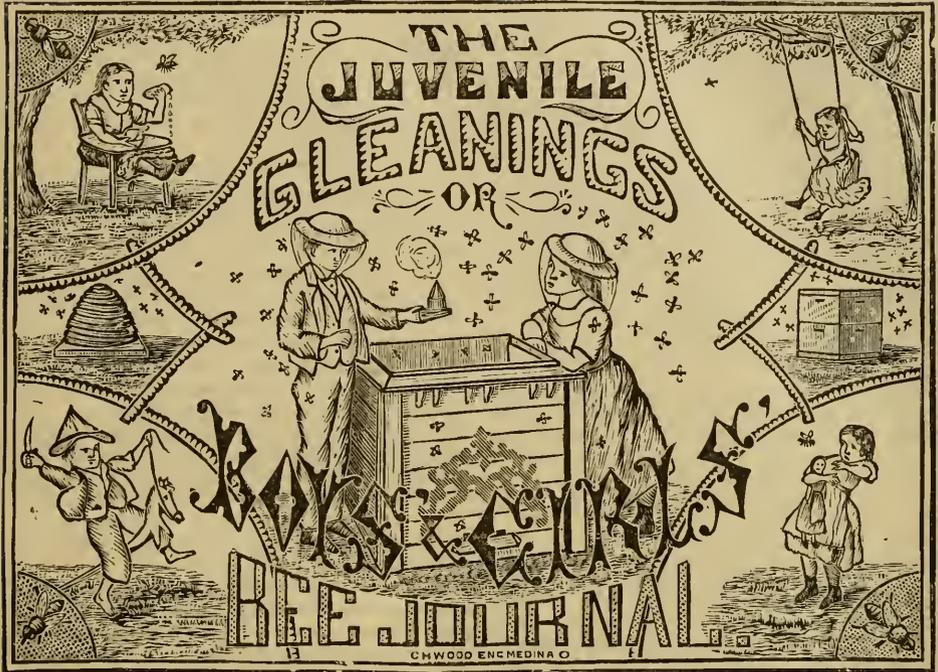

I guarantee satisfaction every time, or money refunded. QUEENS A SPECIALTY. Send for Circular and price list. 3fd

**HOWARD NICHOLAS, Etters, York Co., Pa.**

**BEES BY THE POUND.**

From April 20 to May 20, \$1.00 per pound. After May 20 80c. Three-frame nuclei and whole colonies for sale. Send for prices. Foundation, made on a 10-inch Root mill, same price as A. I. Root gives from month to month. 3-5d

**G. W. GATES, Bartlett, Shelby Co., Tenn.**

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. II.

APR., 1883.

No. 1.

**MYSELF AND MY NEIGHBORS.**

You are of more value than many sparrows.—LUKE 12:7.

**A**NOTHER month has just passed, little friends, and I have more neighbors than I had a month ago. One new one sits right here by my side. I am using a type-writer no longer, but simply talking to her while she makes funny crooked marks as I talk. It is rather new to me yet, and I find it a little hard to talk to you without my old type-writer; but it is so much easier that I am beginning to enjoy it very much.

Now, while we are talking about talking and writing, it occurs to me that we have one neighbor down in the tin-shop who can't speak a word of English. He came to me a few days ago with a friend of his, who could talk for him, and wanted work. I asked him how he could work when we couldn't talk to him. He said he guessed he could do it all right, if we would let him try. I told I would try to find something for him to do before long. It was but a few days before "Ned," who is the "boss tinner," you know, told me they wanted somebody to make little honey-pails, because you are ordering them faster than the hands we have there could make them. I thanked God for that, because I remembered at once our German brother, and thought we could give him work. I soon learned, however, that he used

tobacco, and you know we don't hire anybody here who uses it. I sent word to him that if he could give up tobacco I could give him work. He said he would, and he has been busy at his tins for a number of days past. Nobody can talk with him except Jacob and one other boy; and as Jacob goes to school, he seems to be truly a stranger in a strange land. When I go along through the room, all I can do is to put my hand on his shoulder, and say "Good-morning," and he says "Good-morning" back again; but that is all the talk we have. His friend asked him how he liked it here, and he said pretty well, only he got pretty lonesome, with nobody to talk to. Are you not sorry for him, children? He just works away all day, and is probably having hard work to break off the habit so common in his country—tobacco-using. And there he sits all day long, with scarcely a word from anybody. Now, little friends, do you know how many times it is in our power to make life pleasant to those who are lonely or discouraged? The dear Savior has told us that kind offices such as those are accepted by him as though done unto himself.

Our whole building is now very full of boys and girls. We are so much crowded that we are almost constantly getting into each other's way. And yet a kind Christian spirit seems to be with all. Quite a number among the new comers are breaking off from the use of tobacco. I know, too, they

are having a pretty hard time of it from what they say. Are you not sorry for them? I often wish that I could bear a part of it. Just think of it, boys; all this would have been saved had they not learned to use it when young. I wonder if it is possible that any boys who are reading these pages are thinking of learning to use tobacco. I asked a boy a few days ago why it was that boys ever wanted to learn to use it at all. He said it was just because they wanted to put on style, and look as though they were big men. *We* don't want to put on style, do we? but we want to be just what we should be,—good honest children; and when we grow up we want to be the same,—good, honest men and women.

For promotion cometh neither from the east nor from the west, nor from the south. But God is the judge.—Ps. 75: 6, 7.

We are now waiting for the frost to get out of the ground, to start that new factory I have been telling you about. I am feeling somewhat worried about the amount of money it is going to cost, especially if we have all the nice things in it that we have been talking about. Eliza is to have a counter store with room enough so she can have shelves for all her tinware, etc. Then she is to have a place in a large roomy basement below for all her bulky goods. In the room above her will be the clerks' office, where the goods are put up and mailed to you. The girls in the clerks' office are asking to have their room carpeted, and we also talk of having a room which we are going to call the sanitarium. You see, there are almost enough of us here to make a small village, and all the rooms are so full of buzzing people or buzzing machinery, and oftentimes both, it is a rather bad place for one who has a headache, or is sick. Well, in this room we wish to have a comfortable lounge, easy-chairs, plenty of air, water, courtplaster, bandages and lint, for accidents, and light, and every thing comfortable for those who are sick or hurt, where they may be cared for until they can go home, if need be. We talked about having a doctor too, but finally decided some of our nice careful women-folks would be almost as good as a doctor. Besides this room, we are going to have three fire-proof rooms, one above the other. In the lowest one will be all of the standing type for the A B C book. The one on the first floor will open right into the counter store for the Waterbury watches, plated ware, and our most valuable goods. In the one above, opening into the clerks' office, will be a place for our subscription list, ledgers, and all valuable books, letters, and papers. You see, children, if our building should ever get on fire, and burn up, we want to be able to send you the JUVENILE right along, and also have as little delay as possible. There, I think this letter is long enough for to-day. When you come to see us, you can see all these things. By the way, we are going to enlarge our lunch-room, and put in many conveniences for visitors as well as our own people here, and may be we shall think of the little boys, and girls too, that sometimes come with their papas when they come to make us a visit. Don't you think we ought to do so?

## VIRGIL'S TREATISE ON BEES.

CONTINUED.

**Y**OU remember that in last month's section two swarms of bees had been having a terrible fight; and we were counseled to put a stop to it by throwing dust over them. Now we are directed what to do next.

### SELECTION OF QUEENS.

Truly when both contending leaders brave  
From battle's bloody edge you chance to save,  
Give him who looks inferior to be slain,  
Lest by the prodgal, strife rise again: (1)  
See that the nobler reigns in peace alone,  
With emptied hall and uncontested throne. (2)

### DIFFERENT KINDS OF QUEENS.

Shining with colored segments dipped in gold  
May be the better of those leaders bold;  
Indeed, two different kinds there are of bees,  
Of which the preferable sort are these:  
Distinguished, as their bearing one may view,  
And brilliant with their scales of orange hue. (3)  
Unkempt with idleness the others show,  
Dragging their broad, vile bellies as they go. (4)

### DIFFERENT KINDS OF WORKERS.

And as the styles of kings two forms embrace,  
So are the bodies of the common race;  
Some bristle in their coats of dusty gray,  
As when a traveler plods his weary way,  
Quite covered o'er with siftings from on high,  
Earth he spits forth from mouth so parched and dry; (5)

Gleaming with gold the others flash and shine,  
Their bodies marked in true and equal line.  
This is the better race; betimes from these  
Press the delightful honey — yea, with ease  
It doth surpass the cruel taste of wine;  
Wine's not so sweet, so liquid pure, so fine. (6)

### PREVENTING DESERTION.

But when the fickle swarm would fly away,  
Despise their hives, and in the blue sky play,  
Leaving their dwelling desolate and cold,  
Do you their minds from empty nonsense hold.  
It is not hard to do; from off the kings,  
With no great labor, just remove the wings. (7)  
Not one, while they forbear the airy tramp,  
Will dare to move the standards and decamp.  
Gardens that breathe with saffron flowers invite,  
And help restrain them from untimely flight.  
Likewise a scarecrow for the thieves and birds  
The hive with some protection cheaply girds —  
Priapus, on the Hellespont adored,  
Armed with a sickle made of willow board. (8)

### MORE ABOUT PLANTING.

Let him himself, to whom such things are care,  
Young pines adown the lofty mountains bear, (9)  
And thyme to freely plant around the stands;  
And with hard labor let him wear his hands, (10)  
And fix the plants in earth, for fruitful bowers,  
And spread the friendly artificial showers.

(1) By this we are let into a branch of apiculture which we are very slow to admit that the ancients knew any thing about; namely, improving their bees by destroying the poorer queens and saving the best.

(2) Our grandfathers did not know even this much, that only one queen could be tolerated in a hive. The family arrangements of the man in the moon were about as well known to them as the constitution and laws of the bees.

(3) Here is a delicate and interesting point. What color is the "rutilis" which Virgil applies to the segments of his chosen queen? In its use elsewhere the word is applied to the morning, to fire, to blood, to gold, and to the hair of the early Germans. My lexicon says, "Red, inclining to golden yellow," which is probably not far from the truth. We may conclude, then, that extremely light-colored queens were not well known to the ancients. On the other hand, the very dark, garnet-colored ones would hardly have met the poet's approval. As to the distinguished bearing and air of a nice Italian queen, every one who "knows bees," and who has an eye for the beautiful, can confirm that statement.

(4) If you would solve a first-class puzzle, just tell us what kind of a queen is this rejected one which we are advised to kill off. Some of the melipona and trigona queens have enormously broad abdomens, and drag them as they go; but these races live in Asia and South America, not in Italy. My own opinion is, that the early navigators brought two foreign races of bees to Italy, one of which remains as the well-known Italian bee; while the other, a race with inflated queens, from Asia or Africa, has since become extinct.

(5) If this describes the workers of the well-known German race, Virgil overdoes his business in the comparison (and as the most discreet of all the ancient poets he is not likely to do that); I prefer, therefore, to follow out the supposition made above, and to suppose that those ill-looking, broad-abdomed queens had a worker progeny much more hairy and dusty looking than the Germans.

(6) Virgil was not a teetotaler; but he was generous enough to admit that wine was a cruel luxury, and that honey was superior to it.

(7) Now, doesn't that beat you? Here is an author writing before the Christian era, who coolly sets forth the method of retaining swarms by clipping the queen's wings — one of the very "crinkliest" of modern wrinkles; it looks as though we had better leave off saying, "the mysteries of modern bee-keeping," and say, instead, the ancient mysteries of bee-keeping.

(8) Here the door is set ajar for us to peep into an entirely different world from the one we live in. There were idols almost everywhere in Virgil's time. The most disreputable of the whole hideous lot was named Priapus; and so it came to pass, as we see, that Priapus had to do service in the gardens as a scarecrow — the most sensible use he could be put to, I think.

(9) I never realized until at work on this translation that pines were valuable for bees; but I presume Virgil is right about it. I think, however, that it is usually for pollen rather than for honey that pines are useful. They may at times harbor aphides that secrete insect honey. The only insect honey I ever caught my bees gathering was on a fir-tree. My location furnishes plenty of pollen at all seasons when bees can fly; so I don't have to climb the lofty mountains of Lucas county, and blister my hands, and wilt my paper collar, and all that sort of thing, to get pines for my bees. You needn't laugh; we do have some sand-ridges in Lucas county that rise away up — three or four feet.

(10) The boys who want to be clerks in a dry-goods store may read this. Virgil was somewhat an invalid, and the pet of a whole nation, and the intimate friend of an emperor; and yet he realized, probably from experience, how good it was to get out into the

open air, and work with his hands until the calloused spots began to come.

E. E. HASTY.

Richards, O., Apr. 2, 1883.

My dear friend Hasty, if you keep on at this rate, I shall really have serious fears that we modern bee-keepers will lose a great part, if not all, of our laurels. Clipping queens' wings is no new thing; forest-leaves for covering is no new thing; yellow bees are not new, and selecting best queens was also in practice in ancient times. Speaking of those sand-ridges reminds me vividly of the time when I was only about 18 years old, when I traveled over quite a part of Lucas county, as a juvenile lecturer on electricity. Those curious sand-ridges were a wonder to me as I passed them in trudging from town to town, to put up my show-bills for the entertainment of the coming evening. How I should love to see them now! I wonder if I shall ever get out to see you. Can't you tell us children something more about the sand-ridges?

#### LETTER FROM A 7-YEAR-OLD BEE-MAN.

HOW TO OPEN A SWARM OF BEES AND NOT GET STUNG;  
ALSO HOW TO CLIP A QUEEN AND NOT CRUSH HER.

I AM pa's bee-man, although I am but 7 years old. I can't write myself, so I am to give pa a box of honey to write this letter for me. Pa and I have 23 swarms of bees, all pure Italians. He says, "Harry, open No. 14; I am almost done with this swarm."

Now, I want to tell the boys and girls who read the JUVENILE, how I do it. I take the smoker, go to the hive, and puff whiffs of smoke into the entrance, and wait a few minutes for the bees to fill themselves with honey. The honey makes them gentle. I now take off the outside shell (we use the Quinby), raise the mat, and give them a whiff or two of smoke on top of the frames, to drive them down on the combs. Sometimes some of them are stubborn, and turn their backs up, and run their stings out to frighten me; I then give them a good dose of the smoker, and it's just fun to see them "scoot." I now remove one of the panels, and lay it on the alighting-board, and, "Pa, No. 14 is ready."

And now to clip the queen. Pa lifts the frames up; he looks on one side, I on the other. I can almost always find the queen first, for pa wears "specs," and I don't. When found, I pick her off the combs with the wings with my right thumb and finger; now set her fore feet on the ball of my left fore-finger, and shut my thumb on top of both feet, and I have her secure — no twisting nor squirming around. Now with my freed right hand I pick up the scissors, and if she commences buzzing her wings, gently lay the scissors on top of them for a moment, and she is quiet. "Now," says pa, "clip them close to her body," for one long naked thing among so many wings is more easily found; and besides, pa says that the queens that are clipped closely will run out no further than the alighting-board when they swarm, and, after buzzing her short stubs of wings a few minutes, and finding she can't raise, she quietly walks back into the hive; while the queen with one wing clipped will often partly raise and keep hopping along from one high point to another, until she is lost in the grass and weeds.

There, I must stop or I shall get this letter so long that I fear you will not print it. I should like to tell the girls and boys about my chickens and turkeys, and how I made \$9.75 last summer; but I shall have to wait until next time. HARRY E. MARCH, per pa. Fidalgo, Whatcom Co., Wash. Ter.

Very good indeed, friend Harry. I doubt if any of the older ones could have told how to open a hive better than you have done. You must be a very great help to your pa, if you are with him all the time he works among the bees. I presume these bees you are talking about are some that flew away across the water so far. Now, in regard to cutting the wings all off close to the queen's body, that is a little different from the way we have been doing. Will you not ask your pa if he is sure the bees are no more apt to supersede such a queen? The reasons he gives are new to me, but he may be right about it. Friend Harry, we credit you \$1.00 for your very valuable letter, and I am quite sure the boys and girls will be very glad to hear about your chickens and turkeys.

#### APRIL SHOWERS, BEES, ETC.

**T**HIS month reminds us of the old saying, that "March winds and April showers bring forth May flowers;" and soon the time will come when, if we have nothing else to do, we can notice the changes our bees go through before they begin housekeeping. First, we see the egg; then the larva, or worm, is fed by the bees. Now the question for some of you to answer is, What do they eat at this stage? After a certain time the larva is sealed up in its cell; and when it comes forth it has wings with which to fly, and it seems to know how to use them too. Yet some persons will tell you not to believe that we can ever change or become more beautiful than we are. Why, we ought to grow more beautiful every day! and more useful too. Do you think that our transformation will be any more wonderful than for the larva of the bee to become the beautiful little insect it is?

While there are so many beautiful things created for our benefit we should not make ourselves unlovely, but keep our bodies clean, improve our minds, and not forget that our souls must some day return to God.

It has been said, that "the greatest benefit can be conferred on a city, not by raising the roofs of its dwellings, but by exalting the souls of its citizens; for it is better that great souls should live in small habitations, than that abject slaves should burrow in great houses." E. M.

#### SAMMY AND HIS BEES THAT HE FOUND ON A STUMP.

WHAT WAS THE REASON THEY WOULD NOT RAISE A QUEEN?

**I**WENT one evening, the first week in July, to the pasture to drive the cows for my ma, and found a swarm of black bees on a stump about three feet high. My pa had never kept bees at that time, and had no hives. I went to one of our neighbors and borrowed one old box hive, and pa put the bees in that evening; but when I went in the morning to look at them they were all on the stump again. Pa put them into the hive again; but next morning

they were back on the stump. Then pa went and got a bee-man to come and hive them. He brought a hive and a frame of bee-brood and put the bees in, and they stayed. We brought them to the yard, and they worked well for three weeks. Then they did not work. Pa looked at them, but could find no queen nor young brood. He bought a hive with a strong colony of Italian bees, and put a frame full of young brood in with my wild bees. Pa said if they had no queen they would raise one. We looked at them in three or four days, and they had made two queen-cells. Pa thought they would be all right, but they were not. When the brood hatched out that pa put in, they had no more larvæ, and nearly all the bees are Italians now. After a few days he cut a large queen-cell from an Italian colony, and said for certain they would have a queen now. They took care of the queen-cell, and in five days pa looked, and the queen had hatched out. But we could not see her. In about two weeks they had a patch of drone-brood as large as my hand, but never any more.

But we could not find the queen. The last of September pa sent and got a dollar Italian queen, and put her into the hive. She was a beauty, and the bees were glad to see her. Pa fed them 10 lbs. of white sugar in syrup; and when he put them away for winter the first of November they had a young queen, bees, eggs, and larvæ. Pa put all his hives in boxes with chaff at the back, top, and both ends, and left the front open.

Oh, dear! I am so tired of writing; but no swarm of bees ever had such a story to tell before, as my stump hive. SAMMY A. WOODRUFF, age 9.

Greencastle, Putnam Co., Ind.

You did have trouble, Sammy, it is true; but I think they might have been managed a little better, if you will excuse me. I am inclined to think that their queen was left on the stump, and that is why they went out of the hive, and went back again. Had you put a comb of brood in with them, when they were first hived, they would have raised a queen in a very little time. It is to avoid just such mishaps that I have so strongly advised always giving every new swarm a queen. Again, when the new swarm has been some time queenless, a laying queen is much the safest way. The colony should be then watched; and if she doesn't lay, give them another. We hope to hear that they wintered nicely.

#### BIRTHS.

**T**WO of our office girls, "Bess" and "Stella," left us a while ago, as you may remember. Well, another of the office girls has given us the following bit of news:—

March 10, 1883, a son to Mr. Will and Mrs. Stella Lyons, St. Johns, Mich.

March 24, 1883, a daughter to Mr. Robert and Mrs. Bess Zimmerman, Washington, D. C.

Babies, "stay" and "bee,"  
Of whom we hear with glee,  
We greet thee!  
For thy mamma's sake,  
"Office pets" we'll make  
And keep thee.

Well, well! I suppose next there will be a couple of juvenile letters from these two chicks, to let us know that they *too* are growing up and "taking notes" of what is passing in this world of ours.

### THE COMING BEE.

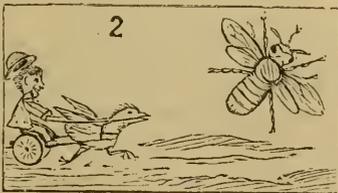

ILLUSTRATED WITH PICTURES.

**I** SUPPOSE, children, you have all heard the talk about a honey-bee that will gather ever so much honey, will never sting, or hardly ever, and that would increase so wonderfully that a single colony might increase to one hundred (or *less*) in a single season. Well, the idea is, that we get this improved bee by careful selection, in the same way that fruit-men give us the improved fruits, and flower-men our wonderful varieties of flowers. You see, the way it is to be done is by careful selection and careful breeding—of course, going all over the world, as our friend D. A. Jones did, to get the best bees that could be found to start with. Well, our good friend W. P. Henderson, Murfreesboro, Tenn., has sent us the following pictures to illustrate it:—

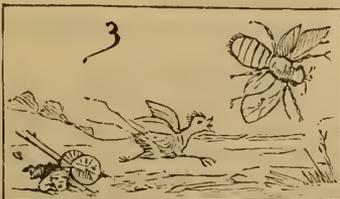

THE COMING BEE.

Figure 1 shows you the coming bee with his wings spread, all ready to fly away to the flowers. See what a great long tongue he has, to reach down into the red clover, or away down into the deep honeysuckle, the way the hummingbirds do.

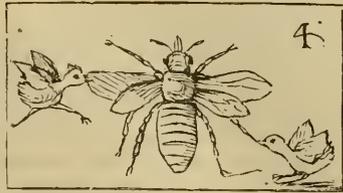

AFTER THE COMING BEE.

Here is a man chasing the coming bee. You see he is so eager in the chase, that the wind is blowing his hat off.

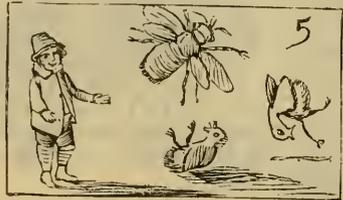

NEARER THE COMING BEE.

In No. 3 we see he has almost caught up with the coming bee; but, alas! his gig has broken down, and there he goes, tumbling in the dust.

WE HAVE THE COMING BEE.

In No. 4, the coming bee seems to have been caught, or at least they think they have caught him. But just as they feel so sure, away he goes again.

I ARISE TO INQUIRE, WHO HAS THE COMING BEE?

But now friend Doolittle's "old man" rises up and says, "I arise to inquire, Who has caught the coming bee?"

### BEE-KEEPING, BY ONE OF THE JUVENILES.

TO KEEP SWARMS FROM GOING OFF; HONEY THAT WON'T CANDY.

**I**N the fall, pa put 30 swarms of bees and 7 three and four frame nuclei in the cellar; but it was so damp, from fixing it so late in the fall, that some of them died. He has 25 left, and some of them are pretty weak yet; but he has lots of honey left from those that died, so that he can feed them. He has three swarms in chaff hives, and those he wintered out of doors, and they wintered nicely. Pa never lost a swarm of bees in swarming-time. When a swarm of bees comes out he gets a frame of uncapped brood and puts it into the hive, and then puts the swarm in it; they will not leave the brood and go off. Pa made his own smoker, and makes them to sell too. He makes the springs of coiled wire, and he thinks they are the best. He has his bees all Italianized now. He sold a few queens last summer. When he sold a queen the bees would make lots of cells, and pa would leave them in until it is almost time for one of them to hatch, and then he would cut them all out but one. Those he cut out he introduced into a hive that had no queen. Pa is making a new buzz-saw, and he has sent to you for the saws. Can you tell me why our honey does not candy? You can leave it open, or you may can it up, and it will not candy. Pa had a box full sitting open all winter, and it did not candy. I think Mrs. Harrison's bees must be awful cross, or she must be afraid of them. My pa and ma go right out among them with their sleeves rolled up, and they do not sting them.

JANE E. STONER.

Merrimac, Wis., March 17, 1883.

A very good letter, friend Jane. You have given us some quite important facts, and we are very glad to know that you are

so much interested in your father's work as to know all that he is doing, and how he does it. I can't tell why your honey does not candy, unless it is because it is collected from some plant that produces honey that won't candy. If you knew what the plant was, it might be worth while to place it among our honey-plants for cultivation. I agree with you about gloves and veils. When I am working with the bees I never want any such things bothering me.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows: Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye takin' notes,  
An' faith, I'll prent it."

**H**ERE I am, little friends, before your great pile of letters again. There are so many of them that I have been obliged to decide to use for print only the best. Therefore, much as I should like to let you see your letters in print, I presume a great part of them will have to be passed by. If you feel disappointed at this, the only remedy I see is to hunt up some valuable fact, so that I can not very well pass yours. Remember that your letters are all carefully read, even if they are not put in print, and "Be not weary in well doing." Who can tell me where I can find that in the Bible, and also what is the rest of it? There, I shall now give the rest of the room to you.

I don't like bees very well, for one stung me on the eye last Sunday. MARIA B. MOON, age 7.  
Youngstown, N. Y., March 22, 1883.

My uncle gave me ten cents a hundred for nailing section boxes. I like to help him work with the bees. HARRY MORRISON.

St. Clair, Mich.

I will write you a letter and tell you what I can do. I carry in the wood, cobs, and gather the eggs. I can pump water and carry it into the house. I shall be six years old the 9th of next July.

Creston, Iowa, March 24, 1883. W. A. SADLER.

138 LBS. COMB HONEY FROM ONE COLONY, ETC.

We had a good deal of honey last year. The highest amount from one hive was 138 lbs. of comb honey. Pa has a Novice extractor, but the honey was so

granulated that it would not extract. He is fixing to raise some queens. Our bees are mostly Italians.

NETTIE BRYAN, age 12.

Rome, Floyd Co., Ga., March 23, 1883.

My pa has his bees in a building, packed with dry leaves, and they are doing finely. He set them out the other day for a fly. Oh! but they had a gay time just as we children do when school is out.

STELLA SHoup, age 9.

Coloma, Berrien Co., Mich., March 26, 1883.

HOW FANNIE'S FATHER WATERS THE BEES.

Pa keeps part of his bees in the cellar, and gives them water by dipping a rag in water and laying it at the mouth of the hive. The bees seem anxious for it.

FANNIE BORTON.

Flint, Gen. Co., Michigan, March, 1883.

100 LBS. FROM A ONE-HIVE APIARY.

I am a little girl. I live with my uncle and aunt. I have over two miles to go to school, but it is closed now. We have one stand of bees; they made 100 lbs. of honey last summer.

MAY POLLARD.

Moscow, Liv. Co., N. Y., March 4, 1883.

FROM 23 TO 62, AND 3500 LBS. OF HONEY.

My brother got 3500 lbs. of honey this summer, from 23 swarms in the spring; he increased to 62. I stayed home from school about a month and a half this summer to watch his bees, and he gave me \$5.00.

EMMA WAGNER.

Calamus, Clinton Co., Iowa.

Papa has about 30 swarms of bees. He gives me 25 cents for every swarm I see first in swarming-time. I live on a farm, but I am spending the winter in the city. I think the best honey is made from white clover. I am a Canadian girl.

EMILY K. WESTOVER, age 10.

Frelighsburg, Quebec, Can., March 24, 1883.

BEES WITHOUT "END."

Last spring my pa had 7 swarms of bees, and by fall they increased to 42; sold two swarms to my grandpa, and it is fun to see him work with them. One day I was at his house when he was working with them, and they came out so fast that grandma said there was "no end to them," but grandpa "allowed" they had an "end," when they commenced to sting him.

FRANK CRAIG, age 11.

LEFT-HANDED MAUD.

My brother Frank is writing to you, and I wanted to write, so ma said she would help me spell the words. My pa makes his own frames, and I help him tack them. He says I am "awful good at it," even if I am left-handed.

MAUD CRAIG, age 9.

Tiffin, Iowa, March 23, 1883.

Glad to hear it, "left-handed Maud."

"BUTCHERING" BEES.

Pa and my brother have 80 swarms of bees. We got our foundation of you. A neighbor came to visit us one day, and he said he was going to "butcher" 3 swarms that evening for their honey. Pa asked him whether he might have the bees if he would take them off the comb. He said he could, and they are now in our hives, with plenty of honey for winter.

EDWARD S. ROE, age 11.

Jordan, Jay Co., Ind.

I am very glad, Edward, that your pa was humane enough to take the part of the bees, and I hope he will do well with them.

My father has ten swarms of bees. They did not swarm at all last summer. One summer a swarm came out and alighted on one of our little trees. Father was gone, so mother and I hived it.

MARY E. GOULD, age 10.

Lisbon, Androscoggin Co., Maine.

#### THE YOUNG FARMER.

I will write you a letter, and let you know what I can do. I can do up all of the chores when papa is away from home. I harrowed in wheat last week for the first time. I will be ten years old the 13th day of next June.

CHARLES F. SADLER.

Creston, Union Co., Iowa, March 24, 1883.

Very good, Charley.

#### THE BOY WHO IS GOING TO MAKE A STEAM-ENGINE.

Inclosed please find one dollar to pay for your soldering outfit. I am going to make me a steam-engine, and I want the outfit to use for it. Ma lent me the dollar, but she says I must solder for the neighbors, and pay her back.

GEO. R. PHILP.

Your ma is right, George. Pay for your tools as you go, and make your work self-sustaining.

#### HOW ALBERT SWARMED THE BEES, AND GOT INTO TROUBLE.

Mrs. Hall has been reading the JUVENILE. Mr. Hall has 45 swarms. My business in swarming-time is to blow the horn. I tried to hive a swarm once, and they got down my pants legs, so I let them go, and called Mr. Hall. Two swarms went off to the woods. He has ready sale for all of his honey at 20 and 25 cents.

ALBERT S. WOODVILLE.

Northfield, Minn., Nov. 27, 1882.

#### A CAUTION ABOUT EXTRACTING TOO LATE.

My father keeps bees. He extracted the honey all out of the upper story, supposing that they had made honey in the lower to live on; but he found that some of them had nothing but bee-bread and drone-comb in the lower story. Another bee-keeper near here had some weak swarms, and pa gave him some bees to strengthen them.

HARLAN E. GLAZIER, age 10.

Virgil, Cortland Co., N. Y.

#### FROM 5 TO 14, AND 18 GALLONS OF HONEY, ETC.

Pa had 5 hives of Italian bees last spring. They increased to 14, and all lived through the winter but two. He keeps them in chaff hives. Pa and ma extracted 18 gallons of honey, and had some comb honey left. Pa likes the extractor you sent him. I go to Sunday-school, and at the close of the quarter I could recite all the golden texts.

RALPH McREYNOLDS, age 9.

Topeka, Mason Co., Illinois, March 22, 1883.

We have no bees at our house, but we have a sweet little baby. I help my ma wash dishes. I like to work. I go to see my aunt. They keep lots of bees. I help them look for the queen. They have an incubator they made out of what they hatch queens with, and we are going to try to hatch lots of little chickens at one time. Please print my letter. I want to surprise them. They take your book. I go to Sunday-school.

GETTY LAWSON, age 6.

Staunton, Clay Co., Ind., March 26, 1883.

To be sure, we will surprise them, Getty. I am real glad you told us about the incubator. Let us know how many chickens it hatches.

#### A LITTLE ORPHAN'S LETTER.

My father and mother are both dead, and I am living with my brother, and he has ten stands of bees. He sent off for some of your Simplicity hives, and I like to be about when the bees swarm; but I don't like to be stung. Bees are a strange kind of insect, but are very useful to make honey, which is nice to put on the table.

URIAH G. INGRAM, age 13.

Waynesburg, Green Co., Pa., March 21, 1883.

I saw in the JUVENILE where the question is asked, "Where in the Bible does it say it is not good to eat much honey?" and you wanted to know how many of our little friends can tell where the passage quoted can be found. I can tell for one. It is Prov. 25:27. Also what two men in the Bible were refreshed by eating considerable honey. I can not find where it says there were two men thus refreshed, unless it was David and the men in the wilderness. I should like to have our little friends answer this question: What is sweeter to the mouth than honey?

LUCY CLARK.

Lenox, Macomb Co., Mich., Jan. 8, 1883.

#### A NINE-YEAR-OLD BOY'S STORY.

You sent mamma a copy of your journal and JUVENILE, and I saw the little folks' letters. I thought I would write one too, as I am a little boy. Papa has three hives of bees, and I like to see them work. Last summer there was one swarm that came off three times before we got it hived. It went back in the same hive twice. The second time it came off, but in about an hour after it went in the hive, there was a swarm of bees that came across the creek, and it went in with them too, and then in about a week they came off again, and papa and mamma hived them in another hive that time.

J. P. MCKARNEY.

Leesburg Station, Pa., March 29, 18 3.

#### THE FOURTH-OF-JULY BEES.

I wish I could come with my little birds to say good-morning to you. We all think you are a real nice man. My papa sent to you in June, 1881, for 2 three-frame nuclei. He has increased it from that to 11 nice swarms, besides taking 100 lbs. of honey.

Last 4th of July one swarm came out and alighted on a grapevine stake. My papa pulled up the stake and carried it to the hive. We called it our fourth-of-July banner. Our bees are republ' cans.

My papa raises a great deal of small fruit, and the blossoms are nice for the bees.

Ada, Mich.

UNA LABARGE, age 8.

#### "HOT CORN," TO MAKE HENS LAY.

I have just been reading some of the juvenile letters, and some are very interesting; so I thought I would write and see if anybody would be interested in mine. We keep Italian bees and Leghorn hens, and get eggs every day. We warm the corn in the oven before giving it to them, which makes them lay much better. We live on a bank about forty yards from Long Point Bay. I go skating in winter, and swimming in summer. The steamer comes in twice a week. We have a boat in which we go fishing.

GEORGE MASON, age 8.

Port Rowan, Ont., Can., March 26, 1883.

I like hens too, George. We got 17 eggs yesterday, and a few days ago we sold a lot of roosters, and they brought about 40 cts. apiece. Don't you think we are doing pretty well?

## REPORT FROM A TRAPPER.

Pa has 22 hives of Italian bees, and he got 600 lbs. of honey in 1882. He has islands in James River on which he traps. He has caught 276 musk-rats and 8 raccoons, and 3 otters. I have two sisters and four little brothers.

CORA F. STEGER, age 13.

Paynes, Va., March 27, 1883.

## SAWING BOARDS, AND MAKING SUGAR ALL AT ONCE.

My father has a saw-mill. He saws lots of logs; he saws from three to four thousand ft. a day. There are about 500 logs in the mill yard now, besides what he has sawed. We make molasses, and boil it by steam in the mill.

MARY BARNABY, age 10.

Rootstown, Portage Co., Ohio, March 30, 1883.

There, Mary, that is just what I thought of doing—boiling our maple sap by steam power. The only trouble is, I did not know just how to do it. I wish I had time to make you a visit, and then, you see, I should know all about it.

## BETWEEN THE MOUNTAINS.

We live between two mountains, about one mile apart. You will think that is a narrow valley; but it makes it up in length, nearly forty miles long. Our bees are working very strong now on sumac and white clover. Sumac is very plentiful, and it swarms with bees from dawn till dark. Are your section boxes made of basswood? Papa says it is what we call linden here. I do not know whether they are the same or not.

## FIXING THE ENTRANCES.

Brother Lee and I took our hand-cart and went to the steam sawmill, half a mile, and hauled sawdust and banked up in front of our hives to make an alighting-place for the bees; they came so laden, that they would fall before they got to the alighting-board.

VICTORIA J. FIELDS.

Valley Point, Pa., July 20, 1882.

Basswood and linden are the same, my little friend. I am glad to know you are fixing up the hives so nicely. Your letter came last summer and we have just got to it.

## THE TWO "EARNEST" CHILDREN; FROM 5 TO 21, AND 50 LBS. OF HONEY.

Papa has got 21 stands of bees. He started with 5 in the spring; took off 50 lbs. of surplus honey, and increased to 21; he feeds them when it isn't too cold for them to fly. Sometimes mamma feeds them. I go to school all the time.

HATTIE EARNEST.

Knightstown, Henry Co., Ind.

## BERTIE'S LETTER JUST AS HE WROTE IT.

MR ROOTE PAPA HAS GOT 21  
STANDS OF BEES I AM A LITTLE  
BOY FIVE YEARS OLD IF YOU THINK  
THIS LETTER IS WORTH A BOOK  
PLEASE SEND SILVER KEYS  
BERTIE EARNEST  
KNIGHTSTOWN HENRY CO. IND.

Well done, children; to be sure, you shall have your books.

## WINNIE TELLS HOW HER FATHER MAKES FDN.

I am going to tell you how my father makes foundation. He buys the wax, and has to cleanse it; then he melts it again, and takes thin boards, about

18 inches long and 8 inches wide, with a bail on, and dips it into the hot wax two or three times; then dips it into cold water, which makes it come off. He piles it up in piles and puts it away until he wants to make fdn. of it. I have to help him make the fdn. He uses the press machine. I wet the dies for him with starch; after he makes fdn. of it he cuts it up to put in the boxes and frames. I think this is all.

WINNIE RANS, age 13.

York, Liv. Co., N. Y.

## SARAH'S PA'S BEES.

My pa had two swarms of bees last summer. They did not swarm at all. Pa got a man to look at them, and he found they had made 25 or 30 lbs. of honey, outside of the frames. I do not know what kind of hives they were. I can cook, wash dishes, sweep, make beds, and do almost all kinds of housework. Our bees were blacks, and pa sold them in the fall.

SARAH HIGBEE, age 10.

East Randolph, N. Y., March 16, 1883.

I suppose, Sarah, the bees made the honey in the cap to the hive, or in some vacant space. I should think, from your report, that your pa is not very much of a bee-man.

## 160 LBS. OF HONEY FROM 4 STANDS OF BEES.

Pa has 4 stands of bees, and he extracted 160 lbs. of honey from two of them. I thought the honey was very nice, and everybody who saw it wanted to buy some. Extracted honey is something new to everybody in our part of the country. Last summer when I was gathering flowers to make a bouquet I saw bees on a weed called carpenter's-square. I watched them awhile, and I could not imagine what they were doing; and when I went home I asked pa, and he said they were gathering honey from the flowers on the weed.

KATIE THOMPSON, age 12.

LaFontaine, Ind., March 26, 1883.

Katie, your "carpenter's-square," as you call it, is our old friend the Simpson honey-plant that so much is said about in the A B C book and the bee journals. Its real name is figwort, I believe. I am glad to know that you are interested in seeing the bees work on it.

## SYLVESTER, AND THE WAY HE HAS "FUN."

I have 6 brothers and sisters. We live about 3 miles from Montrose, in Ambrosia school district. We have 4 horses to tend to, and 13 hogs and 22 cattle. We have a good deal of fun on Sunday playing ball and marbles. In the summer we go swimming sometimes. I am going to a party the 10th. I was over to a party the other night, and had a good deal of fun. I have written all I can think of, and now I will close. The book I will take is Pilgrim's Progress.

SYLVESTER BOYD.

Montrose, Iowa, March 5, 1883.

Why, Sylvester, do you mean to say that you play ball and marbles on Sunday? It seems to me our boys and girls of your age ought to go to meeting and Sunday-school. Don't you think so? If you read the little book we send you, "The Pilgrim's Progress," I think you will see what troubles Christian and his companion Hopeful had when they got just a little way out of the straight and narrow path. They got imprisoned in Doubting Castle, and had several troubles before they got out. Now, think of it, will you, and see if it doesn't seem to you that such games on Sunday are starting just a little in the wrong path?

## A NEW HONEY-HOUSE, A BRANCH APIARY, ETC.

My pa has 50 swarms of bees, and he and my two eldest brothers made 40 new hives during the winter. Most of them are Langstroth hives. I like to watch him take honey from them. Pa built a new honey-house and lathed and plastered it. I have signed the pledge, and go to the Band of Hope every Saturday. I like to go. I also go to Sunday-school; I have a very good teacher. Pa has an apiary 7 miles from town. He says you will give a book to little boys and girls if they write. Would you please send me one? I am lame. JAMES FOOTER, age 10.

Cumberland, Alleghany Co., Md., March 23, 1883.

To be sure, we do, James, when they write a good letter like yours.

## IS OLD FOUNDATION GOOD?

We received the supplies March 24th. Pa began last spring with two stands, and increased to five, and got about 150 lbs. of honey, mostly extracted. He never saw the inside of a hive with bees in it. We have our bees in the Champion hive, but are going to change to Simplicity this spring. Pa would like to know if foundation two or three years old is just as good as new. DWIGHT BIRCHARD.

College Springs, Iowa, Mar. 24, 1883.

This question has frequently come up lately, as to whether fdn. is just as good after it is several years old. We have often tested the matter, but have not been able to see much if any difference. Fdn. is frequently put into the frames, and a part of it left over until another season, without being drawn out. These frames, when given new swarms in the spring, seem to answer as well as any.

## CHARLEY'S STORY OF THE BEES AND THE HIVES.

My pa has 23 stands of bees. We got lots of honey. We turned our horse into the yard to eat some grass, and he came close to a hive of bees, and got stung on his nose by a bee. He then ran so that we could hardly catch him. I tell you, he remembered it, and he never went close to a hive of bees again. I am going to school, and can read and spell tolerably well, but I can not write very well. Our teacher does not instruct us in writing, so I am very much deficient in it. I also go to Sunday-school.

CHARLES W. NELD, age 9.

High Hill, Mo., Mar. 20, 1883.

My little friend Charley, it is a very bad habit to fall into, of finding fault with your teacher. I presume that the teacher thinks that nine years is almost too early for a boy to commence to learn writing, and very likely he is right. Do as your teacher asks you, and study to obey his orders, and I shall have no fear but that you will become a good writer in time.

## BEES AND STRAWBERRIES.

We have some bees. I like to work with them. The moths killed ten hives. We also have some strawberries—about two acres. We shall have lots of them this spring. My cousin wrote this letter for me.

WADE MANNING, age 10.

Bartlett, Tenn., March 28, 1883.

I am afraid, Wade, that what you say about the moths killing ten hives is not quite orthodox. Do you know what orthodox means? I am afraid your bees were not properly cared for. We bee-folks think, nowadays, that the moths never kill bees directly. After they get down very weak

from neglect, moths may sometimes do them some injury. Probably you pay more attention to the two acres of strawberries than you do to the hives of bees.

## BERTHA'S LETTER ABOUT HER FATHER'S BEES.

My father has 130 swarms in the cellar, except 6 which he put outdoors Saturday. He has a handbarrow, with which he carries his bees out of the cellar. He and my brother Will were carrying some of them out of the cellar. They set one on top of the other, and they tipped them off. When Will saw them going he let go. Pa had quite a time to get them back. I have never helped much in the beeyard, only to catch queens and drones; but pa said he would sell me a swarm and let me try to be a bee-keeper. He makes beeswax and foundation. He puts the comb into a boiler, with water; when it boils he sinks a little wire basket in it, and then he dips the wax out of the basket with a little dipper.

BERTHA BLANCHARD, age 11.

Ironton, Sauk Co., Wis., March 26, 1883.

Thank you, Bertha, for the idea about rendering wax. I suppose you mean your father puts his combs into a basket made of fine wire cloth, and when the water boils he sinks basket and all into the boiling water, and then dips off the wax as it rises to the top. I think your father and brother had better be careful how they set the hives down. It makes pretty bad work to let the hive tip over. You see I know, because I have tried to do it.

## A NEW WAY OF TRANSFERRING; BY A JUVENILE.

I am an A B C scolar. I read it from the beginning to the end. I have one stand of Italian bees, which my pa gave me this winter. They are very strong; I am going to run them for comb honey this year. I am going to be a bee-keeper. Pa bought one box hive of bees last week at a public sale, for one dollar. We prepared a Simplicity hive by putting in three frames of comb and honey. We cut a hole in a board six inches square, and put it under as a bottom for the hive; we then turned the box hive upside down, and placed the Simplicity hive on top, and placed them in a spring wagon and started for home, a distance of three miles. When we got home, all of the bees were in the upper hive. What do you think of transferring bees in this way? Our bees wintered all right. We put sixteen in the cellar, and packed seven colonies on their summer stands in dry-goods boxes, six inches larger than the hives, with hay and straw between the hives and boxes, and about 8 inches above, and placed boards on top to drain the rain off. They are all in fine condition at present. Four weeks ago, on a fine warm day, we carried those in the cellar out to have a flight, and then carried them back again. They are all healthy. JOHN V. NEBEL, age 13.

High Hill, Missouri, Mar. 20, 1883.

Why, John, your trip of three miles answered the same purpose as drumming them out, which some of our old bee-keepers tell about. Your discovery in transferring, then, is this: Fix your new hives with combs or foundation, or both; then fasten it securely over your old box hive, turned bottom upward. Set it in the wagon, and drive three miles, when you will find the bees all out of the old hive, in the new one; then you can transfer the combs at your leisure.

## A LETTER FROM "HONEYVILLE."

My pa and I have just come in from the bee-yard, examining the bees. A few were weak in honey, so we gave them more. This morning it was cool; but toward noon it began to get warm. This afternoon, when we examined the bees, what do you think we found? Well, we found young drones just hatched out. We found drones in only one colony, which had an imported Italian queen 5 years old, but she is now dead. My pa has 34 colonies of bees, and he has 66 more which he tends for the half. I had 2 colonies of bees last fall; but one has died, so I have one left, and that a pure Italian. There is a store not quite half a mile from here. It is named Honeyville, and it has the right name too, or I think so—don't you? There are nearly 90 people and children living in Honeyville. May be we shall get a post-office here, and then we don't need to go so far for the JUVENILE. Sometimes I can't hardly wait till it comes, so I can read the letters from the boys and girls.

DANIEL J. MISHLER, age 13.

Ligonier, Ind., March 29, 1883.

## THE WAY CHALCEDONY GOT THE PEACHES.

One little girl told me that bees made honey, and I thought so too; but pa says bees don't make honey. He says God makes the honey, and the bees gather it and carry it to their hives. Pa has a bee-yard, and there is one peach-tree in it. Last summer the tree had peaches on it, and I did not know how to get them, for I was afraid of the bees; but I will tell you how I got the peaches. I took a tin dipper and tied a long stick to the handle of it, and then held it under the peaches, and knocked the limb with another stick, and the peaches fell into the dipper; so I got them that way, and the bees did not sting me. I learned all I know, at home.

CHALCEDONY MANNING, age 10.

Bartlett, Tenn., March 22, 1883.

Your plan of getting the peaches was quite ingenious, my little friend. But is not your name, "Chalcedony," a little singular? How many of our little friends can tell us what "chalcedony" means?

## FLORENCE AND THE BEES.

Pa has to feed his bees now. He puts white sugar in boiling water, and makes a syrup. He used to put the syrup in saucers, and made floats of wood full of holes to feed the bees. But now he has made feeders. Pa made his own smoker. He took round oyster-cans and made the fire-chamber, and for the bellows he took two pieces of wood the same size and tacked strips of leather to them. Uncle and pa have just bought some lumber to make new hives for next summer. Pa gave uncle a hive of bees last summer; he has two now. When he comes to see us he talks about nothing but bees. We laugh at him, and tell him that he has got the bee-fever badly. Pa was examining his bees last night, and found that one colony was half frozen to death. He brought them in the house, took the top off the hive, and warmed pieces of carpet and put over the top of them. This morning they were flying around the room. Pa has not taken them out of the house yet; but if he had left them out of doors they would have been dead. Pa set out a great many strawberry-plants, and some raspberry-sprouts. He had a basket full of strawberry-plants left, and gave them to me to make me a little strawberry-patch, so my little brother and I set them out. I will answer Hugh

J. White's question, Where in the Bible does it say that John the Baptist ate locusts and wild honey? The third chapter and fourth verse of Matthew.

FLORENCE E. COOMBES.

Memphis, Ind., March 25, 1883.

## HOW MANY EGGS DOES A QUEEN LAY? QUERY FROM A SCHOOLGIRL.

Can you tell me the number of eggs a queen will lay in her lifetime (of course, I mean the average queen), and oblige a schoolgirl? NELLIE ADAIR.

Oswego, N. Y., Jan. 13, 1883.

I can't tell, Nellie, but I can make a rough estimate. For instance, we will say a queen, although she *may* lay 300 eggs a day, lays, on an average, 1000; and although she may live to be three or four years old, we will estimate that she lives two years. In two years there would be about 730 days. Let us estimate that she would lay 1000 eggs per day for 500 days. This would be 500,000. Now, Nellie, suppose we prove it another way. A good ordinary queen will often send out, during her lifetime, as many as three good swarms in a season, and for two seasons; this would make six good swarms of bees. Now, we estimate a swarm to have about 40,000 bees. This would give 240,000; and as all the bees that are hatched do not go out in swarms, perhaps as many more are hatched. This would give something like our first result, 500,000 eggs, laid by a queen during her lifetime.

## SUGAR-CANE THAT THE BEES WORK ON; REPORT BY A JUVENILE.

The other day father and I cleaned the seed of our orange cane (the kind the bees work on) with an old-fashioned flail, and father thinks it is the best way. He has been cutting your advertisement out of papers, and sending them with his Plymouth-Rock chicken circulars, and he says if you will print some of your advertisements on slips of paper he will send *them* with his circulars, and increase the circulation of GLEANINGS.

CHARLES E. ISRAEL.

Beallsville, Monroe Co., Jan. 8, 1883.

Thanks, Charley, for your report on sugar-cane. I shouldn't wonder if your father would have calls for all the seed he has to sell, from bee-men. I would suggest, that if he has any to spare that he furnish it at regular prices, 15 cts. per lb., and 18 cts. more where wanted by mail. Will you please write us another letter, and tell us how much sugar you get from it? We are very much obliged indeed to your father for sending out our advertisements. Tell him we will gladly send him as many price lists as he wishes, and then he can send them out when he sends goods.

## LIZZIE AND HER UNCLE.

Uncle takes your paper, and he has a new A B C book. I believe he thinks as much of it as I do of my new scrap-book. When we have callers he will say, "See my new bee-book." Then I say, "See my new scrap-book."

Uncle commenced last spring with two hives of bees; and now from those two he has nine; besides, one of his first large swarms went off. We have had all the honey we wanted to eat, some to give away, and some left yet for winter. The bees did not fin-

ish some of the last boxes. They did not finish the cells, or cap it over. Uncle thinks it is because it was too cold for them to work the wax, as the comb in the middle of the box was finished, and not outside.

#### BLACK HONEY.

Can you tell us where the bees get the black honey they sometimes fill a cell with? Sometimes in the white comb we find a few cells filled with a black honey that looks as though it had coal dust in it. The honey tastes sweet, like the rest. I know my letter is too long.

LIZZIE GLISAN.

Cedar Rapids, Iowa, Mar. 20, 1883.

The black honey may be honey-dew, friend Lizzie; but are you sure it is not an occasional cell of pollen that makes the white comb honey look dark?

#### ABOUT THE BEES THAT GOT DROWNED, AND THE LITTLE HIVE.

I thought I would write you one and let you know about my swarm. It has been such a long cold winter that I think they are all going to die. There are lots of them crawl out in the snow, and die. There was one warm day this winter, and it thawed very fast, and the ground was covered with water, and lots of them flew out and got drowned. Papa picked them all up and put them in pans in the house, and they all came to life again, and he put them in a little-glass hive, just big enough to hold two frames, and he had a good time getting them in. He put them out in the snow till they got stiff, and then he brought them in the house and put them in the hive and put them down cellar, and they are all right.

BENNIE MOON, age 9.

Youngstown, N. Y., March 23, 1883.

You have given us a timely warning, Bennie. When we first located our apiary there was so much water standing around in puddles for the bees to get drowned in, that we went to the expense of having the whole apiary thoroughly underdrained. Since then we have had no trouble, not even during the wettest spring weather. I should fear the bees your father put in the little hive are needed in the hive where they came from.

#### FRIEND ATCHLEY'S CHILDREN.

As I never wrote a letter to you, ma says that, as pa has gone away to transfer some bees for a man, my brother Willie and I may write you a little letter and not let him know it, and then he will be surprised when he sees our letters in the JUVENILE. Pa has 125 colonies of bees, all Italians, except one good Cyprian that grandpa Marshall, of Marshall, Texas, sent me. My ma's name was Marshall before she was married. I cook dinner while pa and ma and Willie are at work with the bees. I have a nice little garden all to myself. Pa likes the extractor very much. If you can read my letter, and think I am entitled to a book, send me Ten Nights in a Barroom.

AMANDA J. ATCHLEY, age 9.

Thank you, Amanda. I shall be very glad to surprise your pa in that way.

#### HOW WILLIE GOT HIS SWARM OF BEES.

As sister Amanda has written you a letter, I will write one. Inclosed find 20 cents. Please send me a 15-cent dictionary, as I have to borrow sister's to get my lesson. I have a pig, and a garden too. I help pa with the bees. As grandpa Marshall and pa were looking through the bees last summer they found a young queen that was just hatched, behind the di-

vision-board, from some broken pieces of brood and eggs that were placed there to hatch out; and as they raised the cover she ran under the division-board, and the bees balled her. Pa gave me three frames of brood and bees, and I introduced her, and now I have a fine colony. I tell pa, when he scolds me for having his hatchet, that he ought to get me one, and then I should not want his. Ma says she is going to get a subscriber for that photograph, sure. I made part of these letters by myself, and ma held my hand some.

WILLIE ATCHLEY, age 7.

Arlington, Texas, March 24, 1883.

#### FROM 11 TO 26, AND 200 LBS. OF HONEY.

I think the JUVENILE is the bee-paper published for young folks. In the spring of 1882 my father had 11 colonies of bees, and increased to 26 in the summer. They wintered very well, only two stands dying, and those were weak. Father got, on an average, about 200 lbs. of surplus honey, as last season was not a very good one for honey. Father has just bought a lot of Walter Saymasters, of this town, for \$180, and he hopes to put his bees over there this summer.

F. L. MINOR.

New Lexington, O., March 19, 1883.

Thank you, my little friend, for the compliment to the JUVENILE. Yours saying, however, that it is the best bee-paper published for the little folks, is something like the boy who got rewarded for being next to the head in school. After the man had given him 5 cents he said, "Hold on, 'bub,' how many are there in your class?" The reply was, "Me and a little girl."—Now about that 200 lbs. of honey. Was it 200 lbs. from the whole 11 colonies, or 200 lbs. from each of the 11? You see it makes quite a difference. Your words, "on an average," look as if it might be 200 lbs. each. But as we don't want to overstate anything in print, we put it 200 lbs. for all, as you see at the top.

#### LOOKOUT MOUNTAIN, ETC.

When I last wrote to the JUVENILE we lived in Indiana. We now live near the top of Lookout Mountain. Pa brought 25 stands of bees with us. It is very steep where the hives are placed. Some are on large rocks. It took pa a good while to dig a place for each hive. We can see all over Chattanooga. We can see many nice things on the mountain. Pa is getting up a collection of ores, rocks, and bullets and cannon-balls. I found a bullet one day while we were out looking around on the mountain-side. Pa wrote you a long letter about our trip, but you never printed it, and ma laughed at him, for he had all his trouble for nothing.

MAGNOLA THORNBURG, age 8.

Chattanooga, Tenn., March 16, 1883.

Thank you, my little friend; but I am very sorry indeed to be obliged to say that your father's letter is among a great heap of others, waiting for a place. Tell your ma not to laugh, for we will see that he has not had all his trouble for nothing. Ask your pa if he is sure the top of a mountain will be a good place for bees. Will they not have to go down in the valley for honey, and then fly up hill with it? It seems to me I would have the hives on the lowest ground, so that the bees might load up with honey from the flowers, and then sort of "slide down hill" when they are sailing home.

## REPORT FROM CANADA.

Pa had 45 hives of bees when he packed them last fall; he looked at them this week, and he found 12 stocks dead. Pa got my sister and me a swarm each last summer for helping him with them. They are both alive yet. I like bees, but they do not like me. We got first prize for honey and beeswax at Lindsay Fair for 3 or 4 years. If you ever come to Reaboro, come and see us, and I will give you some nice white honey. Do you think you could find our house? We are next neighbor to John and Robert Calvert's father. Ma says if she ever goes to Medina she will take me with her to see you and your bee-yard. I hope she will soon go. We had 2000 lbs. of honey year before last, but had not more than 400 lbs. last summer. My two sisters took off 160 1-lb. sections from two hives one day. EMMA HICKSON.

Reaboro, Ont., Can., Mar. 31, 1883.

## DECOY HIVES—A FACT FURNISHED BY ONE OF THE JUVENILES.

Last spring we didn't have any bees at all; we had some hives (in which we used to keep bees) standing in the yard. One day we saw bees flying around it; they came and they went until they got the hive clean; they then moved into it. Another swarm came soon after, but they died. We put the remaining swarm in a box with some straw about them, but it was too damp, and some of them died. We then put them up stairs. They are all right now. This is my first letter. GERTHA RIBBLE, age 13.

Cedar Rapids, Linn Co., Iowa.

Thank you, Gertha. You have revived the old matter in regard to putting up decoy hives. Some years ago it was suggested, that if convenient hives were fixed in readiness for the bees when swarming-time came, they would go into them. You see, you have given us proof that this may be sometimes so. Who can give us more facts of new swarms going into hives already provided for them?

## HORSEMINT HONEY; IS ITS PECULIAR FLAVOR GOING TO INJURE THE SALE OF IT?

My pa's bees are doing very well. He has promised brother John and myself a bee-hive apiece if his do well this year, and I shall be very much delighted with them. The most of the honey that is extracted here is flavored with horsemint, and it is very good. The honey that is made late in the season is generally bitter. Is not very good to eat. It does quite well for the bees to eat in the winter. It is flavored with wild chamomile, and that makes the honey bitter. SIMME CARR, age 11.

Maysfield, Milam Co., Texas.

I am glad to hear about horsemint honey, my little friend; and while I think about it, I have some good news to tell you in regard to the horsemint. Last year one of our friends in Texas sent us a can full to try. It was very thick and light-colored, but it had a twang to it that few of us could like very well. After trying several times to eat it, it was set away in the cupboard and left until this spring. As we had to cut a round piece out of the top of the can to get at the honey, it stood open all winter. Well, this spring I was most agreeably surprised to find the unpleasant flavor almost entirely gone. In fact, we now pronounce it most beautiful honey. It stands in a quart fruit-jar, and is

so wonderfully clear that people inquire what it is. It is so thick that the jar could be turned over in cold weather, without spilling it. The flavor is somewhat similar to clover, with a slight horehound taste, or something nearer like horehound than any thing else I can think of. Now, then, friends, set your horsemint honey in open dishes, protected from dust and flies; and I think if you let it stand long enough you will find the peculiar unpleasant flavor has entirely disappeared. While we are on this subject, I believe it is true that the same treatment will remove any unpleasant flavors from any honey; even though gathered from seed onions, I have been told it becomes perfectly sweet and pure after standing long enough either in the hive or in exposed vessels, in the way I have mentioned.

## COUNTING THINGS, AND SOME OTHER MATTERS.

## RAPIDITY AND ACCURACY.

**I** WONDER how many of these children can count correctly. Suppose your mother gives you a basket of eggs, and tells you she wants you to tell her exactly how many there are. Can you do it, and have it right the first time? How old must a boy or girl be to count, say four dozen eggs? Again, if I should set you at it, how would you go to work? I fear there are a great many of you who would count 1, 2, 3, 4, etc. Now, my little friends, there are many reasons why this is a very poor way to count any thing. Sometimes we see big men whose time is worth from \$1.00 to \$1.50 per day, or even more, who will pick eggs out of a basket one at a time in counting them, and even then make mistakes. Grown-up people often count pennies in the same way; and when we get new hands in the shop, counting out pieces for frames, they almost always commence counting one by one, unless they are watched and told better.

Shall I tell you the better way? The better way of counting eggs, you will easily discover if you will watch the man to whom you sell eggs. You will observe that he takes three eggs in each hand, and lays them in the basket. In this way he is counting six at one operation. He does it without thinking, and almost without the possibility of making a mistake. All he has to do is to count the number of half-dozens. In counting loose pieces here in our factory, we are in the habit of taking five in each hand. Lay them down together, and you have a heap of 10. Do the same thing until you have 10 heaps of 10 each. Now gather them up and you have 100, without any mistake. After a little practice, the fingers will count five without even knowing it, and you will soon learn to detect 10 almost at a glance. So you see your work is proved as you go along. In this way a little girl will count comb-guides faster and more accurately than four big men would do it in their awkward way of counting one at a time. One thing more: When you have to count a number of things, have them very handy. Suppose, for instance, you want to count out 50 honey-

tumblers out of a barrel. One way would be to take one tumbler in one hand out of the barrel, and set it into a basket on the floor. Do this 50 times, and you would have 50. And in stooping over and getting up 100 times you would probably get pretty tired. I have seen full-grown people tire themselves out in work, almost as thoughtless as this. Now I will give you my way: First, set your basket on a box or stool so the edge of the basket will be on a level with the barrel. Now count out your tumblers with three in each hand; or if your hands are small, two in each hand; or, if the tumblers are very large, perhaps one in each hand. Work rapidly, and prove your work afterward by weighing, thus: Weigh half a dozen tumblers; and then after you get through, weigh the whole. In this way you know there is no mistake. You see, there are two things needed in counting articles — rapidity and accuracy. Suppose you should say you don't care if you are slow. My little friends, a slow person will have to work for 50 cts. a day, where a quick and accurate one gets from \$1.50 to \$2.00 a day, or even more. There are many other similar ways of expediting work and to assure accuracy, which I can not take space to mention to you now; but the same general rules that I have mentioned to you now will apply in counting all kinds of work.

But few people understand how to count money rapidly and accurately. A great deal of time is taken to count it, mistakes are made, more time is taken to correct them, misunderstandings come up, these take more time and sometimes hard feelings, which last years, are the consequences. Our time clerk who has just been around, pays out \$400 or \$500 every Saturday afternoon, and when she pays the boys and girls, she always makes every one of them count it after her, and give her an assent that it is right. This prevents any one from going after her to tell her she has made a mistake. When you pay *anybody* money, always insist that they count it, and acknowledge it is all right. Before I adopted this method, every little while somebody would insist we made a mistake, and did not give the right change. Now in regard to counting money. If you have many coins to count, put them in piles 10 high, then put your piles 10 in a row. If the piles are not of an exact height, you can see at a glance that there is a mistake somewhere. If you have considerable money, assort it so each coin will be by itself, then put on your book so many of these, and so many of those, until you get it all down. If anybody should afterward tell you you have made a mistake in counting, you can say to them pretty conclusively that you did not. If you do business in this way, by and by you will get a reputation for accuracy; and who is there who does not admire and respect an accurate person? Why, I have clerks so accurate that I would depend on their counting, a great deal quicker than I would my own. Such clerks, of course, always command high wages. Now, then, who can count four dozen eggs, do it the quickest, and have it exactly right, and not break any?

## KIND WORDS FROM OUR CUSTOMERS.

The A B C came to hand all right. I would not take \$5.00 for it, if I could not get another one.  
Pennsylvania. T. R. PHELPS.

The little ones here are delighted with the counter goods. They are very nice. W. B. CORBETT.  
Bennettsville, S. C., March 23, 1883.

Those scales came in about 30 days after you shipped. They fill the bill; glad you took the liberty to send by freight. E. S. MILLER.  
Dryden, Lapeer Co., Mich., March 20, 1883.

My hundred hives arrived a few days since, all, as far as opened, all right. I wish I had ordered 300, as I find I can sell them. M. M. MORRISON.  
Corsicana, Texas, March 31, 1883.

The Story of the Bible came all right. We think it is a very handsome book, and just the book for young folks. MRS. MARY J. RUGER.  
Conklin Station, Broome Co., N. Y., Mar. 8, 1883.

I received those goods the 17th, and am greatly pleased with them, especially the A B C book. I think it is a perfect gem. J. P. ALLSHOUSE.  
Evansport, DeFiance Co., O., Mar. 23, 1883.

The watch you sent me is all right. It is a nice little watch. I bought it for my boy, and he thinks so much of it he wouldn't sell it for any money.  
Hustisford, Wis., March 28, 1883. A. L. LEHMAN.

Please find inclosed 75 cts. in stamps for a Clark's smoker by mail. They are a little wonder, and can't be beat. Please send as soon as possible. It is for a neighbor. EDWARD E. CHAPIN.  
La Salle, Ill., Mar. 15, 1883.

### PROGRESSIVE.

Seven years ago, when I first began keeping bees, there was not a bee in town; now there are 30 beekeepers, who keep from 1 to 75 swarms each.  
Castle Hill, Me., Mar. 17, 1883. EDW. TARR.

The last bill of goods sent did very well, and any one who would find fault with any of them would be hard to please. Your \$7.00 mandrel is a little beauty. F. D. CLARKE.  
New York, Feb. 14, 1883.

The 30 lbs. of fdn. is received. It can't be beat, especially the thin worker for sections. GLEANINGS is not "flat" yet, and never can be with A. I. Root at the helm. HERBERT LANGDON.  
East Constable, N. Y., Mar. 20, 1883.

I made about 10 lbs. of fdn. to-day to try my mill. I like it so well that I shall have to send you a sample of about the third sheet I made. Publish my praise of the mill to the world, if you wish. Any one who will try can use it. N. A. SANDERS.  
Montevideo, Hart Co., Ga., April 7, 1883.

I had intended that you should not have an opportunity of notifying me that my time had expired; not that I intended running away, nor because I did not like friend Root or GLEANINGS, senior and junior, that I would not be without them for the small sum they cost. I do not flatter the editor, for I do not like flattery myself, when I say that I have formed a very high opinion of him as a gentleman and a Christian, for a true Christian is ever a gentleman.

### CHRISTIAN UNITY.

I hope the editor is a Baptist, for I am; but whether he is or not, I am sure he is a Christian, because of his words and works, and I love him as such. Now, I hope that not only the editor, but all who read this, will stand up nobly for the Lord Jesus, who is worthy of our love and adoration.

E. J. HAINES.  
Cheltenham, Ontario, Canada, Feb. 27, 1883.

[I commend your concluding sentiment, brother H., and earnestly pray that, no matter what the denomination, we may be a unit in every good cause. Thanks for your *very* kind words.]

I received the Waterbury watch Feb. 26; it has been running ever since, and I am more than satisfied. It has not varied a minute since I got it. It is very cheap indeed. NIELS LARSEN.  
Fairview, Sanpete Co., Utah, March 10, 1883.

## SILVER-PLATED KNIVES.

The knives you sent came all right. They are "just splendid" for only \$1.75; thanks. Bees doing finely. MRS. NELSON KELLEY.  
Ferndale, Whatcom Co., W. T., March 10, 1883.

I received those two bbls. of tumblers (481 of them), and there was not one of them broken. Every one was wrapped up in paper, and kept nice and bright. Many thanks. WM. FULLER.  
Woodville, Wis., March 27, 1883.

## OUR \$1.00 CARPENTER SAW.

That rip saw I would not take a \$1.00 note for, unless you keep more just as good. I think it came from the top of the heap. J. M. TAFT.  
Arcadia, Wis., Mar. 12, 1883.

## OUR FDN. MILLS.

We are especially pleased with the fdn. machine. We dipped a few sheets of wax, and rolled them nicely in a few minutes. A. R. NISBET.  
Dobyville, Ark., Feb. 21, 1883.

Tell Blue Eyes she has a namesake at our house. She's a little over three months old, and can crow and laugh, and sit alone a little. C. KINGSLEY.  
Greeneville, Tenn., Dec. 9, 1882.  
[May God bless the little namesake, friend K.]

My wife sent to you for a Waterbury watch for a Christmas present for me, and as it keeps good time, looks so well, and is so cheap, there are some of my neighbors who want me to send and get them one. E. S. COLLINS.  
Cedar Lake, Montcalm Co., Mich., March 26, 1883.

I received my 25-lb. box of fdn. in good condition, and can say that I like it the best of any I ever saw. I am perfectly satisfied in all parts in which you are concerned; but I thought the freight bill (\$1.45) was rather exorbitant. ELMER CROSS.  
Racine, Meigs Co., O., March 28, 1883.

I suppose you will wonder what "Zalmon" wants now. Well, I will soon tell you. Those little 3/8-in. wire nails are the nicest thing in the whole business for making our little quart berry-baskets. Gustavus, Ohio, Mar. 12, 1883. Z. D. ST. JOHN.

I have not used any tobacco for over one year, after using it for 20 years. Has any one who took a smoker for quitting done any better? I think if there is a smoker coming either way it is to you. THOMAS C. WILLIS.  
Breckenridge, Mich., March 13, 1883.

GLEANINGS and A B C came to hand in due time, and I am now having a royal time in perusing them. It seems to me that every apiarist should feel deeply thankful to you for the A B C, for it is certainly a jewel. May the good Lord help us to benefit by its teachings. F. E. PARSONS.  
Rochester, Wis., March, 1883.

The full-dial Waterbury watch came safe to hand, and is running well thus far. I like it so much better than the old style, I would not take ten dollars for it, if I could not get another like it. Thanks for promptness and fair dealing. G. J. FLANSBURGH.  
Bethlehem Center, Albany Co., N. Y.

## THE JONES PAILS.

The goods which you sent me came to hand all right, and in good order. Grocersmen are very much pleased with the tin cans. I think they will like to handle honey in that shape. The labels are very neat. E. J. COOK.  
Owosso, Shiawasse Co., Mich., March 23, 1883.

The socks and envelopes were received all right, and I must say they were very cheap. The socks would cost me here at least 50 cts. per pair, and the printed envelopes are just what our printer charged me \$2.00 for. Your price is just half that. I reckon you must have "stolen" them. M. D. DUBOIS.  
Newburgh, N. Y., Feb. 21, 1883.

I received your postal on the 12th. I have had several offers of employment. Your paper is the one to advertise in. E. S. FOULKES.  
New Albany, Floyd Co., Ind., March 13, 1883.

The honey-knives are at hand, and my friends are gone off rejoicing to think they got their goods before they thought the letter had time to get to you. Thanks for promptness. The Star saw-set and cant file are at hand. The saw-set is just what everybody needs. Perfection, I think. E. J. ATCHLEY.  
Arlington, Texas, March 24, 1883.

I am well pleased with the goods, and especially with chaff hive; it is far ahead of any thing I have ever seen in the way of a home for our industrious little pets. One other thing I don't understand about the chaff hives; that is, how you can make them as cheap as you do. J. W. ROSEBERRY.  
Kent, Mo., March 20, 1883.

Friend E. S. Miller has sent the extra bottle of ink, in place of one broken. Friend Miller is a perfect gentleman, and a good workman. The stamp sent, etc., gives perfect satisfaction. It is a great satisfaction to deal with good square honest men like you and others whom you recommend. *Dominus vobiscum.* R. C. TAYLOR.  
Wilmington, N. C., Mar. 19, 1883.

[Which means, I presume, "The Lord be with you."]

It seems to me you place more confidence in human nature than the generality of people, or you would not have sent the second lot without first receiving the first one again, or their equivalent—cash. JOHN S. SNEARLY.

Williamsville, N. Y.

[Friend S., I have more to fear from the carelessness and neglect of humanity than I have from willful dishonesty; or, at least, that is my experience among the bee-friends.]

The goods came to hand in the nicest order. Please accept my hearty thanks for your promptness. I am very much pleased with the fdn., and astonished to get so excellent a quality in the other goods at the low price you sell them. Express charges, 75 c. Some time ago I received a box, lighter, and about the same size as yours (goods not in your line) from one of your neighboring counties, and the express charges were \$2.00; therefore I asked you to send the goods the cheapest way. T. HILDBRECHT.  
Clarksville, O., March 14, 1883.

## KIND WORDS FROM SCOTLAND.

The Home Papers are particularly attractive. They somehow contain the very message and advice we are in need of. Many thanks, also, for the children's portion. Bees had a wet summer during 1882. With great attention I succeeded in carrying off the prizes for section-box honey. Through a firm in Glasgow (dealers in American wood) I got from you 2000 Simplicity sections; but as the season was so bad, only about the half have been disposed of. JOHN MAIN.

The Cross, Doune, Perthshire, Scot., Dec. 27, 1882.

## KIND WORDS FROM OUR FRIEND "ANABEL."

The A B C is received. Many thanks for sending cloth binding and the pamphlet. The book is both beautiful and useful. We took our bees out yesterday. There were 42 in the cellar, and every one was alive and in good condition. Out of 20 in the house apiary, 3 did not answer to the roll-call. We have still about 2000 lbs. of honey to dispose of. The market seems very dull. ANABEL RONALD.

Grandview, Ia., Mar. 15, 1883.

[Who will take friend Anabel's honey? If it is clover, I will give 10 cts. for it *delivered here.*]

I am pleased with the extractor, and hope I shall succeed with it just as well as I am pleased. The scales are just about the same that I was asked \$12 for in Greensburgh, our county-seat. I set them up without any difficulty, and tested them, and found them correct. They told me that my weight was 117, and that of Mrs. C., 108. The other things are satisfactory and nice. I shall have to take a lesson, I guess, before I am an expert hand with soldering-tools; but I can do it. You will please accept my

sincere thanks for good goods, promptness, etc.; and if I make a failure with any, you are not at fault.

T. J. COOK.

Newport, Ind.

[You see, I promised to send my sister a barrel of hickory nuts, walnuts, and butternuts, and the man I was going to get them of was slow in bringing them, and this is what she wrote:—

Seven little youngsters, brim full of fun,  
Wandering each day why those nuts do not come.  
Mamma at her work often wonders, too,  
How the time is passing with dear sister Sue.  
Pack her off to Michigan for a little visit;  
Just a few weeks, please; you will never miss it.

Manistee, Mich.

Your sister SARA.

I didn't forget, sister mine; but the man said the nuts were not dry enough so they wouldn't mold; says they will do now.]

JUVENILE for Feb. has not come yet, playing truant on the road, I suppose. Flanagan is here as busy as a bee, getting bees for the northern market. I think he has solved the wintering problem; viz., take the bees away from the winter. If you stop the queen, bee, drone, wax, square list and counter departments, don't stop our Homes, as we can not get along without them; and also rear a king or queen to take your place before you are superseded.

D. W. REIZIE.

Carrollton, Jefferson Co., La., March 13, 1883.

[Thank you for your kind words, friend K. May God help me to so instruct our children, that when the time comes for me to lay down the Home Papers, with all the rest of my busy cares, that one of them may be able to minister to the kind friends whom I have found through the pages of GLEANINGS.]

#### A PLEASED CUSTOMER.

The box of goods shipped to my address the 27th Feb. is received. The freight was 85 cents. By express it would have cost \$1.10. Your system of packing is just perfection; every article was in prime condition, saving me 25 to 40 per cent over buying them here, while some of them could not have been bought here at all. Those table (kitchen) knives at 10 cts. each are a boon, as it is so difficult to buy knives without forks at the stores, and these are so well made and nicely finished they are exceedingly cheap. That Story of the Bible is a grand thing for children. I was surprised to find it a bound book, so well made. I wish I had ordered 10 bunches of those 5-cent envelopes instead of one.

Portland, Mich., March 12, 1883.

S. C. PERRY.

#### FOUR CENTS WELL INVESTED.

I have been dealing with scamps, or trying to, for some time, and find out it doesn't pay; so I have made up my mind to deal with honest men in the future; and as I think you acted like one, I have given you the preference. Last summer I sent for the A B C and some other things, and they all amounted to \$1.93. I sent a \$2.00 bill, expecting you would send the things and keep the money; but the things came all right, and 4 cents in stamps. I call that honesty refined, as I should have been satisfied, nor did I expect the change back, as the amount was so small. I was well pleased with all the things, especially the A B C.

J. F. VERGASON,

Marlborough, Hartford Co., Conn., March 15, 1883.

[It would seem, friend V., that that four cents was well invested. We have, until recently, been in the habit of giving credit of what remained over after filling an order; but of late I have told the clerks that they might put in small amounts in postage-stamps. So in your case, it seems they put in the four cents as usual. I am sorry to hear that your experience has been unsatisfactory in dealing with your fellow-men. We are glad to say that we find very few among bee-men who do not seem to want to do right, after they once get a fair understanding of the matter.]

#### THE WATERBURY WATCH.

My watch came all right, and was giving good satisfaction till it accidentally got a fall which broke a pivot from one of the wheels, which could be seen through the crystal. I took it to a jeweler for consultation, which, of course, I could have free. He told me it would be worth \$2.50 to repair the damage that could be seen; and as I did not employ him, and the watch was not opened, I don't know how much more damage was done. But I sent it to the factory, and it was repaired and returned at a cost

of 50 cents for repairs and postage, and it keeps as good time as any watch I ever carried. I have great confidence in the Waterbury watch, and consider it a very economical one to own, for the following reasons. 1. Its cheapness; 2. Its quality as a timekeeper; 3. The small cost of repairing when sent to the factory. The greatest objection I have had to it was the time occupied in winding it; but I have overcome that by making a key with which I can wind it in one-half the usual time, and now to wind it is so much fun that I am always sorry when it is done.

Canton, Ill., Jan. 8, 1883.

G. W. COLE.

#### THE BOY WHO SUGGESTED JUVENILE GLEANINGS, AND ALSO SOME KIND WORDS FROM THE FATHER.

Here is the photo of my son Charlie who wrote to you two years ago to publish GLEANINGS in the middle of each month. He was nine when it was taken. Now about those long letters, just keep them, and when your business grows so you can publish a daily, they will come handy. For the monthly GLEANINGS, boil down, skim, clarify, purify, and sift. It is better to offend one than all. Be careful not to get your heart on the new house, but remember there is one in heaven, that will not be spoiled by smoke. We remember how, a little over one year ago, when we finished our new house, we had all the walls hard finished, and how much pains we took with one room for mother. But she never occupied it. But we trust she is in heaven, as it was she who taught our intant lips to pray. You remember I wrote how God took all the tobacco poison out of me in a moment. Well, even now some of my friends want to know if I have a desire for tobacco. No, not a bit. He is keeping me, and I expect he will. Brother, keep trusting him, and asking for more faith for all your wants, especially for the Homes; do not fail to speak the whole truth, for it is to religion that you owe your prosperity. Hold up both hands; and if, like Moses', they should get tired, remember there are Aarons and Hurs who will hold them up.

Oran, N. Y., Feb. 26, 1883.

WM. H. BALCH.

[May God bless you and your boy, my good friend Balch. I do need your prayers and your sympathies. I am very glad to know you have conquered tobacco, and I am trying to trust him every day through all my cares.]

#### USEFUL CARDS, FOR GIVING TO CHILDREN.

Have you had time to print those little prayers on cards, and also those like the ones you sent me about swearing? You said you would print some when you had time. I have a class of little ones in Sunday-school. They don't know any prayers. "Now I lay me down to sleep" would be a good one. If you will send me some I will pay you whatever you ask. All my scholars learned the card, "Jesus, teach me not to swear." I think some of them will remember it as long as they live.

JOHN WATT.

Fairham Center, P. Q., Can., Mar. 7, 1883.

[We have all the cards in stock now, my good friend, and will mail as many as anybody wants, free of charge, to any address. The kind we have in stock are as follows:—

Now I lay me down to sleep,  
I pray the Lord my soul to keep;  
If I should die before I wake,  
I pray the Lord my soul to take.

Jesus, teach me not to swear;  
This shall be my earnest prayer;  
All day long, at work or play,  
Jesus, teach me what to say.

It chills my blood to hear the Bless Supreme  
Rudely appealed to on each trifling theme.  
Maintain your rank; vulgarly despise;  
To swear is neither brave, polite, nor wise.  
You would not swear upon a bed of death:  
Reflect; your Maker now could stop your breath.

Please do not be afraid, dear friend, that you will send for too many. I will gladly have printed and sent out all the world can use. Of course, I would not want them thrown away and carelessly lost. Whenever you have an opportunity of giving them where you think they will do good, do not feel troubled about the number you use, but rather rejoice that you can use so many.]

Woe unto him that striveth with his Maker.—ISA. 45: 9.

JUVENILE is just one year old to-day.

UNTIL further notice, we will pay \$1.00 each for dollar quarts. The same will be furnished for \$1.50.

We are still about 25 orders behind on fdn. mills, in spite of the best we can do.

We have now plenty of extra nice alsike, \$15.00 a bushel, \$7.75 for ½ bushel, or \$4.00 per peck.

We still continue to get plenty of wax at 35 to 40 cents; therefore the present price of foundation will remain unchanged.

CAN'T any of our friends in California mail us any more of the yucca brushes, such as we have been selling, for brushing the bees off from the combs?

ADVANCE IN THE PRICE OF WIRED FRAMES OF FDN.

WITH the present advance in prices on fdn. we find ourselves obliged to put metal-cornered frames, wired and filled with fdn., at \$18.00 per hundred, instead of \$15.00 as heretofore. We make the remark, that we are producing a better article now; that is, the sheet is of an equal thickness throughout.

A SMOKER FOR LITTLE MONEY.

We have, laid up on a shelf, several dozen old Quinby smokers that cost us something over \$1.00 apiece at the time when they used to sell for \$1.50. We should be glad to sell these now for 25 cts. each. If wanted by mail, send us 15 cts. extra, for postage. Each smoker is packed in a pasteboard box, ready for mailing.

LARGE SHEETS OF THIN FOUNDATION.

MANY customers still persist in calling for thin fdn. for starters, in large sheets. Please bear in mind, friends, that we can get fdn. with a very thin base only by making it into very narrow strips, say from 3 to 5 inches wide. We can make it 6 inches wide; but even then it is not quite as thin as if made five inches wide or less.

SUGAR FOR MAKING THE GOOD CANDY.

We are happy to say that the powdered sugar is a decided success, and we have just purchased a barrel for that express purpose. We ordered the finest and purest sugar that could be procured. It is especially an improvement for the queen-cages, because it obviates the sifting-out of the dry sugar. We can furnish this powdered sugar for 12 cts. per lb.; in 10-lb. lots, 11½ cts.; or 100 lbs. at 11 cts. per lb. Simply knead it up into a dough with good clover honey, and it is ready for use immediately.

THE call for sections has been so great that we are unable to make our drying-house season the lumber as it should be, as fast as wanted. Should you get any sections that are a little damp, it may be well to open them out to dry a little, unless they are to be used very soon. If you fold them right up, they will work all the better. We are now having fine weather, and have an immense stock of basswood. We shall soon have any quantity of nicely seasoned lumber.

WE are now approaching the honey months, dear friends; and to those who have neglected ordering until now, I shall have to say that we can't be responsible for the delays, although we will return your money promptly at any minute when you get tired of waiting. Orders by mail or express, as a rule, go off the same day the order is received, or the day after; but large orders, to go by freight, are many times unavoidably delayed; and one of the worst features of these delays is, that we can not tell positively when the goods may go. For instance, we are dependent on other manufacturers for many goods. If they are delayed by strikes or fires, or other causes, it delays us. Also on many goods of our own manufacture there is liable to be a sudden run far beyond our capacity. Of course, we shall try hard to avoid delays or disappointment to those who trust us with their patronage.

MAPLE SUGAR VS. CONFECTIONERY.

CHILDREN always want candy, and somebody has said that children always ought to have candy, or some equivalent. While in Cincinnati last fall, friend Muth said that he doubted whether any pure candy could be found in the city; that is, candy made of pure cane sugar. Well, maple sugar bought of our home farmers, we know is pure, and we have this season purchased more than a ton, made by the farmers directly into little cakes. By taking more pains than they have ever done before, they have given us little cakes of a creamy whiteness and delicacy of flavor that seem to me far in advance of any confectionery that was ever made in any of the cities. To keep these little cakes nice, and preserve the flavor, we have had our girls wrap them in tissue paper just as fast as they were brought in from the sugar-camps. We sell them for 3 cents each, 25 cts. for a package of 10, or \$2.00 for a basket of 100. If you want a sample of what can be done in the way of nice maple sugar, just send us two 3-cent stamps, and we will mail you a sample cake.

ALLEY'S NEW BOOK ON QUEEN-REARING.

We have just received friend Alley's book on "Queen-Rearing." It is nicely bound, and printed in clear, attractive type. The first one hundred pages is devoted wholly to queen-rearing. In addition to this there are two essays by practical bee-men. The first essay is on the "Management of the Apiary," by Geo. W. House; the second is on "The New Races of Bees," by Silas M. Locke, formerly employed by D. A. Jones.

While we can not fully agree with our friend Alley in some things, yet on the whole he has given us many practical hints. With regard to cell-building in rows, we can hardly believe that his method is entirely new. In our own apiary the boys have used a modification of the same plan for several years back. As, however, the book contains a summary of many of the best methods of queen-rearing, we are glad to recommend it to our bee-keeping fraternity. It contains 184 pp. and 20 illustrations. We can mail it for \$1.00, or send it by freight or express with other goods for 94 cents.

## FULL COLONIES

**Italian Bees with Queen**  
In Root's Simplicity Hive, \$7.00.

E. D. GILLETT, BRIGHTON, LORAIN CO., OHIO.  
5-6d

## SEND YOUR ADDRESS

to CHAS. R. MITCHELL, HAWKINSVILLE, GA.,  
for circular of Italian Bees, Queens, Silkworm  
Eggs, etc., at reduced prices. 5td

**SIMPSON and THOROUGHWOOD PLANTS FOR SALE.**  
J. W. BARLOW,  
5d Belfast, Lee Co., Iowa.

## BEE-KEEPERS' SUPPLIES.

It will pay to get our prices before purchasing your supplies. Good Langstroth Hives, with 8-inch cap, frames, quilt, etc., in the flat, 60 cents each. Manufactured from good pine lumber. Workmanship unexcelled. Crates and Sections cheap, and Duham foundation a specialty.  
WM. O. BURK,  
Successor to Hiram Roop. CRYSTAL, Mont. Co., Mich.  
5-7d

**E. T. LEWIS & CO., TOLEDO, OHIO,**  
Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianary supplies. Send for circular. 1td

## BEE-HIVES FOR SALE!

I manufacture every thing needed by bee-keepers, made of wood, not patented. I make Simplicity and Langstroth hives a specialty. My work is as good as the best, and my prices always please my customers. Send postal card for my illustrated catalogue.  
H. F. SHADBOLT,  
4td WINOOSKI, - - SHEBOYGAN CO., - - WISCONSIN.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

## \$1.00 Queens.

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \* use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

**NOTES FROM THE BANNER APIARY.**

No. 42.

**HOW THE BEES WINTERED.**

**A HEAVY TESTIMONY IN FAVOR OF SUGAR STORES INSTEAD OF NATURAL.**

**A**S I did two years ago, so I did last fall; *i. e.*, I prepared bees in different ways for battling with stern Winter's long siege. Some were left unprotected upon their summer stands; some were protected with chaff cushions; others were placed in the cellar, and still others were buried in a clamp. Granulated sugar was fed to a few of the colonies, and one or two of the sugar-fed colonies were left out of doors, some placed in the cellar, and others buried. One year ago the bees came out all alike, as nearly as I could discover. Last winter was not more than half gone before the unprotected colonies out of doors began dying with dysentery; next followed those protected with chaff cushions out of doors, and then came the colonies in the cellar. Before the winter was gone, only one colony out of 11 remained alive out of doors, and that was the one from which the honey had been removed, and sugar given in its place. Of the 19 colonies in the cellar, 7 were alive, but all had suffered from dysentery, except two colonies which had sugar stores; these were in fine condition, scarcely a handful of dead bees, and every thing dry, sweet, and clean. In the clamp, all had suffered from dysentery, except the sugar-fed colonies. Some of them had died apparently from dysentery; others had been troubled very much,

and others only slightly. Out of 32 colonies, 27 were alive; some were weak, and 3 were queenless; and after some uniting there remained 21 good colonies. I could discover no difference in favor of colonies that had been used in queen-rearing, or *vice versa*. I now have 29 colonies, and the majority of them are in pretty good order.

Now for just a little theorizing. It could not have been cold nor confinement that killed the bees in the cellar and in the clamp, as the temperature and confinement were the same as they were the previous winter. How shall we account for the bees wintering better in the clamp than in the cellar? The theory has been advanced, that bees buried in a clamp are deprived, to a certain extent, of oxygen; consequently they are more dormant, eat less, do not live so "fast," and as a result come out younger and in better condition in the spring. The result of my wintering experiments of last winter helps to confirm this theory. I feel more and more inclined to think that pure cane sugar is the only *sure* thing as a winter food for bees. Heretofore I have fed sugar to a few colonies as an experiment, and henceforth I shall feed sugar to nearly all of my bees, leaving a few colonies with natural stores as an experiment.

A younger brother has come to work with me this summer. He has bought 20 colonies in Langstroth hives, and they will be run for comb honey; so you see there is at last going to be an opportunity for me to see what there is in comb honey.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., April 16, 1883.

## *Humbugs & Swindles* Pertaining to Bee Culture.

We respectfully solicit the aid of our friends in conducting this department, and would consider it a favor to have them send us all circulars that have a deceptive appearance. The greatest care will be at all times maintained to prevent injustice being done any one.

IT will be remembered, that in the Humbug and Swindle column of March GLEANINGS we printed a little circular from our old friend H. H. Flick, and to-day we received the following letter from W. T. Falconer, successor to Merriam and Falconer, of Jamestown, N. Y.:

*A. I. Root:*— Inclosed find letter which explains itself. Have you received a similar letter, and what do you propose to do about it? Of course, I don't propose to pay, but may be put to some trouble and expense. Can we combine and employ some attorney in case a defense has to be made? Please drop me a card or letter in regard to this. Sorry to encroach on your valuable time, but would rather have your opinion in regard to this matter than that of any lawyer, as you are versed in it from beginning to end.

W. T. FALCONER.

Jamestown, N. Y., April 18, 1883.

Below is the letter referred to by friend Falconer:—

*Messrs. Merriam & Falconer:*— We have been employed by H. H. Flick, Esq., to recover damages from certain persons who have been infringing on his patent, referred to in the herewith inclosed circular. He has been engaged for some time in procuring testimony to establish his claims. He has learned that you have infringed on his patent; and before instituting suit, we write you to say that if you are disposed to act fairly, the matter can be satisfactorily arranged, both as to past and future sales and manufactures.

COFFROTH & RUPPEL.

Somerset, Pa., April 16, 1883.

You will observe, friends, that Mr. Flick has induced a law firm to take up his "patent," and proposes to institute a system of blackmail, if nothing further. This same letter, almost verbatim, has been forwarded to us by several other bee-hive manufacturers. You will observe, that friend Flick is going to try to make out that he holds a patent on putting sections inside of any large frames. The idea is most absurd and ridiculous. It is almost equal to getting a patent on using hives two stories high, as some one claimed he had done a few years ago. If any one cares to take the trouble, he will find that our old friend Richard Colvin, of Baltimore, Md., described such an arrangement in the *Agricultural Report* as long ago as 1863, and it is quite probable that the arrangement was in use a long time before that. My advice here is, that if we can learn that Mr. Flick has ever obtained money from any innocent person in the way in which he has now started out, that we, as bee-keepers, club together and set some respectable lawyer at work and ascertain if there is a means to put such chaps as he in some place where they will be prevented from obtaining money on false pretenses from innocent bee-keepers. My attention has been called to a recent

attempt to blackmail in Cleveland, O., and the guilty party is now in the Ohio Penitentiary, at hard labor for three years; and if I am correctly informed, the above lawyers could also be prosecuted for trying to scare people, if they are in the conspiracy. Our friends who have been long in the bee business will remember how we have had men blackmailing bee-keepers for using division-boards, enameled sheets, cloth cushions, two-story hives, etc.; and you probably have heard of the result of this. Men who were not informed have paid over their hard-earned money to these scamps, who then went away laughing in their sleeves. It seems to me that we as bee-keepers are now sufficiently well informed, and also sufficiently well off (thank God!) to resist all this work, by combined effort. Now let them come on with their patents on using sections inside of a large frame, or sections made of one piece of wood, or any thing else of a similar character. If they can stand it, it seems to me that we surely can. I have thought best to copy the following from Mr. Colvin's article, found on pp. 532 '3, *Ag. Report* for 1863. You remember that friend Colvin was one of the first to assist in the importation of Italian bees. Later, many of you will also remember, some trouble was experienced when the Italians were first introduced, from the fact that they would not go up into the honey-boxes as readily as the black bees. In commenting on this peculiar trait of the Italians, Mr. Colvin writes:—

The difficulty of inducing the bees to work in these surplus-honey receptacles is greatly obviated by placing them over the brood-chamber and having no "honey-board" or intervening partition between them and the brood-chamber. A successful remedy for preventing the queen from going up into the receptacles to deposit eggs, and the consequent storage of pollen therein by the workers, thereby injuring the quality and appearance of the surplus honey, may be found in using movable frames in sections, or otherwise, made about 1½ inches in breadth on their tops, and placing between these frames thin perforated partitions, or comb-guides. The space thus allowed for the combs being too thick for one brood-comb, and two thin for two, the workers build but one, the cells of which, being too deep for brood-cells, present, together with the presence of the comb-guides, such uninviting quarters for her royal ladyship that, in the storage of over a ton of honey in such receptacles, I have not had a single instance of egg-laying in receptacles thus arranged. The frames or sections may be made of such size as to contain any desired quantity of honey within their capacity. If several sections are used in one frame they should be made to fit exactly, so that they may be easily and quickly removed by a little pressure.

It is interesting to note that friend Colvin also used something equivalent to our separators ("comb-guides" he calls them), even though it is away back at such an early date.

By the way, friend Falconer, I want to thank you for your concluding sentence. It gave me a sort of stirring-up, and reminded me of the responsibilities that rest on my shoulders, or should rest there. If these things continue, I think I shall have to gather up all of my old books and papers, and have them so classified and arranged that I can, with the assistance of an excellent memory, turn to these things with a little more readiness than I do now sometimes. Many of you know with what enthusiasm and zeal I hunted up and gathered together

almost all that had been written on bee culture when I was first led into it. I have now in my possession books written on bees more than a hundred years ago, and almost every thing of importance that has been printed, from that time up to the present.

### BUYING BEES BY THE POUND WHEN YOU CAN RAISE THEM YOURSELF.

SOME SENSIBLE ADVICE IN THE MATTER FROM FRIEND HOUSE.

**A**FTER thanking you for your catalogue which you sent me on application, I write to ask your advice in relation to building up my apiary, in which I met with severe loss last winter. Out of 50 good colonies of bees that I went into the winter with, I have only 10 stocks left; the cause of this, I am confident, was impure honey gathered late in the season. I am thus left with over 300 good brood-combs, some containing considerable honey. I had thought that, in order to save these combs, I could purchase bees by the pound, with queen, or obtain 3 or 4 comb nuclei. My friend Col. Walton, of Industry (who has before dealt with you), is in the same dilemma with myself. How soon can you send out bees by the pound, and queen? and at what price? or would you advise another plan to replenish our losses? Any counsel will be gladly received.

Beaver, Pa., April 23, 1883. WM. S. BARCLAY.

Mr. House replies as follows:—

*My Friend Barclay:*—All right; if you want my advice, you shall have it. That's just what I'm here for; and if the advice doesn't suit you, you have the pleasure of knowing it was of no expense to you. Now, why in the world do you, with 10 good swarms of bees, and 300 empty combs, want to talk of buying nuclei, or bees by the pound? Why, you are in the neatest possible condition, and you couldn't have more fun than it will give you to increase to 40 heavy swarms, and have 1000 lbs. of extracted honey by fall. I would not attempt to raise much box honey while increasing rapidly. Now, first raise about 10 queens from the best queen you have, and get these queens to laying in nuclei just as early and just as strongly as possible. Keep in mind that the number of bees, and hence the number of strong colonies you have in the fall, will depend directly upon the number of queens you have laying, and the number of eggs they lay. But don't get careless, and let a queen exist in a hive without plenty of bees for warmth, etc. And as your combs are an essential part of your stock in trade, give them the best of care. Hang the frames in hives, or on racks made for the purpose, at least two inches apart, to prevent ravages of moth, and have them secure against mice or robber bees.

Always have queens on hand, and keep every laying queen at her *level best*; let her *wear out*, if need be; she can easily be replaced. But don't be guilty of *keeping* worn-out queens. Use division-boards, chaff cushions, etc., and spread brood-nest just as fast as you can *with economy*, by use of your empty combs. We wish you and your friend Col. Walton the greatest success, and I shall be disappointed if you meet with any thing short of that.

Medina, O., Apr. 25, 1883.

W. B. HOUSE.

I entirely agree with the remarks of Mr. House; and, in fact, I have many times felt

almost pained to receive orders for bees by the pound from those who, it seems to me, could raise them very much cheaper than we could sell them. It will be noticed that we charge \$3.00 per lb. for bees this month. Now, perhaps nearly half of this price is to pay for cages, expense of putting up, and guaranteeing safe delivery to remote points. Another thing: We have purposely put the price high, because we are so overwhelmed with orders every season that our apiary would soon be entirely gone, did we not charge high. It may be urged that I should get more bees and more help; but the truth is, dear friends, I have more cares now to look after than any one man ought to have. Where one has lost *all* his bees, and has nothing to begin with, then bees by the pound, even at our prices, will probably be a profitable investment. The same may be the case with beginners, where they want perhaps a single pound, or others who want them to play with, or study, as may be the case; but where one has an abundance of combs, and ten colonies of bees, they ought to be, it seems to me, able to make \$10.00 a day, raising bees by the pound at our prices. That is, they would save \$10.00 a day by raising them, instead of purchasing them at \$3.00 per lb. I am glad to sell you goods; but I never wish to sell you any thing where you could get it cheaper some other way than by buying of me.—In regard to the manner of raising bees, our journals are full of reports and directions, and our text-books make the matter so plain that it seems to me even a child can take it up and do it successfully; and earnest students often do succeed, even the very first season.

### AN IMPROVEMENT SUGGESTED ON THE YUCCA BRUSH.

A LONG-NEEDED WANT SUPPLIED.

**S**OME time last season I sent to you and got a yucca brush to use in our apiary, and liked it very well, except it was too small; so I invented a *hempen* brush, a sample of which I send you by this mail. The fiber of the brush is sea-grass taken from a piece of new rope. The plan of construction is simple, and easily understood. I hope you will think enough of it to give it a trial. If the brushes are mussed, and out of proper shape, just dip them up to the "head" in water, and press out with the hand, on a board, and when dry they will keep their place.

COOK'S BRUSH FOR GETTING BEES OFF THE COMBS.

These brushes are worth 25 cts. each to those who keep bees; you know a brush of some kind is indispensable, and the cost of such a one as I sent you is nothing, compared to the time it takes to gather asparagus tops, etc. They are worth 25 cts. each, but can be manufactured for about \$1.25 per doz.; single brush, 15 cts.; half dozen, 75 cts.

The few warm days we are having just now make me feel well. Bees are working briskly, gathering

pollen, and the combs are fast filling with brood. Just now every thing indicates a prosperous season ahead.

T. J. Cook.

Newpoint, Ind., April 12, 1883.

Many thanks, friend Cook. The minute I saw your brush I felt satisfied you had done us all a great favor. It is better than the yucca brush, because it is broader, and yet it may be made more substantial also. With us the yucca brushes are so cheap we have been in the habit of laying them around on the ground, and on top of the hives in the apiary. This plan can hardly be recommended; although where a thing of this kind is wanted so often, and is also liable to be wanted by different persons at the same time, it might be a good investment to have several of them — perhaps half a dozen in an apiary of a hundred or two hives. As you have suggested the improvement, friend C., I think you had better manufacture them. Make them strong and durable, and I will gladly take a gross of them at the price you mention. They can be furnished by mail for about 18 cents each, if made no heavier than the one you sent us.

## “Remindery.”

Or Department for duties to be attended to this month.

**N**OW is the time with most of you for business in real earnest. The advice given in different columns by Mr. House will bear reading carefully, perhaps several times. Of course, it makes a difference whether you wish increase of stock or honey. Decide first what you want to do, and then do it. I presume that with most of you, fruit-trees will be in bloom when this number reaches you. If you have any transferring to do, now is the time to do it. Have a queen of some kind in every hive, under no circumstances allowing a colony to be idling away their time because it has no queen. A black or hybrid queen is better than none at all, for we want eggs laid every day, and every night too, for that matter. If you can have a good prolific queen in every hive, of course it is better; but a poor queen is better than no queen. If you have on hand a stock of empty combs, get them into use before the moth-worms come to make havoc with them. If these empty combs contain also stores of honey, all the better, even if the honey came from hives where the bees died of dysentery. It will do no harm now; in fact, it has been pretty well demonstrated by repeated experiments, that honey that will produce dysentery among bees one season may not do so another. Be sure that the queen has room. They may fill all their combs with brood and honey from fruit-bloom, almost before you know it. Never say, “Why, I looked at them only day before yesterday, and I didn’t think it possible they could occupy all the room in so short a time as this.” If your bees swarm during this month, rejoice. If they keep building up and don’t swarm, rejoice more. Be sure to be ready for whatever may hap-

pen. Have a hive or two all ready, fixed to hive the swarms in at a minute’s warning, and do this before you have any idea that the swarms may come out. Have every thing necessary for the care of surplus honey in readiness in the same way; that is, have every thing all ready before you think it possible it can be needed.

One great secret of success in having work with bees, work on the farm, or any other kind of work go along briskly and profitably is in anticipating what you may need before you come to it; and when the time actually comes, in having all ready to go right along. Have extra tools and extra implements of all kinds as far as possible, so that if one won’t work, or is borrowed, you won’t have to stop work. Be wide awake in all things, and “whatsoever thy hand findeth to do, do it with all thy might.”

I do not know all of you, my friends, but let me give you this piece of advice here: If you want to succeed as a bee-keeper, be up before five o’clock every morning at this season of the year; and if you get tired out by nine o’clock, go to bed by nine o’clock, and be ready to get up *next* morning. Whenever the bees are at work, you are at work, and out among them.

Rainy days are sure to come, and therefore it behooves you to have some work laid out for such days. Don’t be spending your time on nice sunshiny days at indoor work, and then find yourself prevented from doing necessary outdoor work when it rains. Do your indoor work rainy days and evenings; and when the sunshiny days come, make the most of them.

## TO MAKE NATURAL SWARMING MORE CONVENIENT.

SOMETHING FROM FRIEND KENDEL ON THE SUBJECT.

**V**ERY often when swarms issue it is more or less windy. At such times bees will fly about, vainly trying to find a steady place to cluster; and at such times they will take most kindly to a grape-post or some other unpleasant place which can not be shaken. Noticing this I planted small trees, trimmed them up to a convenient height, say 4 to 6 feet, cut the branches short to make a solid head, and then drove three sticks firmly into the ground, some three feet from the stem, and tied the upper ends firmly among the branches; this secures the tree or shrub firmly against any breeze, and bees cluster most readily. Get a few young peach-trees and try it. I keep a hive under the tree all ready for occupancy, with fdn. or empty combs; this may also be an attraction; but certain it is, that although my 25 swarms stand in my garden of 40x100 feet, it is very seldom that one clusters over the fence, and I have always practiced natural swarming.

Their tendency to cluster where previous ones have been, also helps in this plan. I always have a short-handled swarming-box ready, into which, with one shake, the bulk of the cluster falls. When these are poured in front of the hive, and the swarming-tree kept slightly in motion, the whole community will readily cluster, or, rather, run, into the hive in an incredibly short time, particularly when a frame of brood has previously been hung in.

Cleveland, O., March 27, 1883.

A. C. KENDEL.

**STATISTICS OF BEES AND HONEY FOR THE UNITED STATES.**

THE RESULT OF FRIEND MILLER'S LABORS.

**W**E take pleasure in giving the following as the summing-up of the reports that have been sent in for months past in response to the calls through the various journals. This report was first put in print by the *American Bee Journal*, it may be well to explain.

Many of those who reported sent in only part of the items asked for, in some cases omitting the spring count, in others the fall count, especially of 1881. This will explain such discrepancies as, a positive gain in wintering, the apparent decrease for 1882 in Minnesota, and the enormous increase in Maryland, etc. These defective reports might have been safely modified by assuming a fall count at least equal to the spring count, and assuming a spring count bearing at least a small proportion to the fall count, and the items of some of the States might have been largely increased by incorporating reports obtained from other sources; but it is, perhaps, best to give exactly what was sent in, in response to the call; neither adding to nor subtracting therefrom. It will be noticed that the largest numbers are reported for Illinois. It does not necessarily follow that Illinois has more honey than any

other State. Possibly a good year in Illinois made more bee-keepers of that State willing to send in their reports. A bad honey crop in New York probably accounts for that State being sixth on the list as to number of persons reported. New York, however, stands second on the list as to spring count reported, showing that those reported from this State own a large number of colonies as compared with other States.

The average number of colonies reported for each apiary are:—

Fall of 1881.....	20.1
Spring of 1882.....	35.5
Fall of 1882.....	35.4

The average number of pounds of honey produced by each person is:—

Comb honey.....	628
Extracted.....	616

Total..... 1244

The average number of pounds per colony:—

Comb honey.....	30.58
Extracted.....	30.00

Total..... 60.58

Thanks are due to many, whom it would be a pleasure to name did space permit, for the pains taken in sending in reports for others. As has been suggested, Illinois makes the largest reports. On page 51 of *Bee Journal*, is a table by counties for the State of Illinois of the honey crop of 1881, given at 618,947 pounds, and the total number of colonies (pre-

sumably spring count) for 1882, given at 86,633. These figures have been gathered by law by the assessors of the various townships, perhaps the only instance of official State reports of this kind ever published in the bee papers.

There are reasons for believing that these figures are below the mark, and yet the spring count for Illinois, in the present table, must be multiplied by 15 to make it equal the assessor's reports. After multiplying reports from other States by 2, 5, 10, or 20 to bring them on a level with Illinois, then multiplying again by 15 we may get at something like the truth.

C. C. MILLER,

April, 1883.

Chairman Statistical Com.

### KEEPING UP BROOD-REARING DURING A DEARTH OF HONEY.

SOME IMPORTANT FACTS IN THE MATTER.

**FRIEND ROOT:**—I have been keeping bees for the past thirteen years. The last ten it has been my principal business. I had 240 colonies last fall; lost but one in wintering, probably smothered. My crop of last season was 10,000 lbs., 7000 of which was comb honey. I am aware that this is by no means a large yield for the number of colonies; but when account is taken of the fact, that in this locality we get no clover nor basswood honey, it may be considered a fair crop.

And now I have a few thoughts to present to the readers of GLEANINGS, upon a point which I believe bee journals have not overdone. In this place, as a rule, we get no surplus honey until about the first of August. I presume the same is true of a large part of Southern Illinois, as well as in many of the recently settled localities of the West.

Our colonies get strong enough by the middle of May to swarm, at about which time our spring bloom falls, then for six weeks or more these large colonies of bees have to depend mainly on their rapidly diminishing stores. In small or moderate-sized hives they often run out of honey, and cease to raise brood, and even throw out the uncapped larvae. Not a great many colonies die of starvation; but if left to themselves they are very weak at the beginning of the honey season. By noting the time that elapses between the commencing of brood-rearing in the spring, and the gathering of the first surplus honey in August, it will be seen that a good part of their spring stores are consumed in the rearing and feeding of bees that will finally die of old age before they have had an opportunity to gather a pound of surplus.

Just how to remedy the difficulty under which we labor is therefore an important question. The most obvious and immediately helpful remedy for starving bees is generous feeding. For summer feeding I have found grape or corn sugar, placed on top of the frames, the most economical and convenient article. Another remedy, not so immediately active, but likely to be more permanently helpful, is a liberal sowing of white-clover seed in pastures and roadsides in your neighborhood. I am expecting that my house apiary will receive some benefit from this treatment the present season.

Now, friend Root, I very well know what remedy you would prescribe for the case in hand. It would be to sell the surplus bees by the pound, instead of buying sugar for them. I tried this plan last season, but my advertisement has not resulted in the sale

of a single pound of bees. So I concluded that this remedy, while very pleasant to take, can not be depended upon for general use, though I intend trying it once more.

There is another remedy for the difficulty, that suggests itself to my mind, though I have not yet fairly tested it, and it is the one of which I wish particularly to speak. It is to retard brood-rearing in the spring by confining the queen to about two frames, until near the close of our dearth of honey, and thus save the queen from unnecessary exhaustion, and the stores from being consumed in rearing and feeding of useless bees.

I believe that division-boards that will only permit bees to pass under them will be sufficient to keep the queen at her place. If not, the perforated metal plates certainly would. I expect to try this retarding process in my Clay county apiary, and to some extent in my home apiary.

Farina, Fayette Co., Ill.

T. P. ANDREWS.

Thank you, friend A. I should by all means try to avoid loss during the months you mention. And were it not for the time it takes to get clover started, I should by all means advise the clover, as clover honey stands at the head of all honeys. While waiting for the clover to grow, I should by all means feed; and for feed in the fore part of the season, under the circumstances you mention, I am inclined to think I should use the much-abused grape sugar. Where a poor quality of maple sugar can be bought for 7 or 8 cts. per lb., perhaps that might answer just as well. I presume you have not yet *built up* a trade in bees by the pound. With us this trade has assumed such proportions that we can hardly keep a pound of bees in the hive; and even on this 17th day of April, if we filled our orders we should hardly have a bee left. By all means keep them going by some means or other.

### FOUL BROOD.

ARE WE FULLY AWARE OF THE DANGER THAT  
THREATENS US ALL?

**T**HE inclosed card of Prof. Cook speaks for itself. Please publish it in your next number of GLEANINGS. I expect to be convinced of the fact, that brother Jones never had foul brood in his apiary, otherwise one of his boys would never be able (or have been able) to cure his colonies in such an easy manner. Brother Jones would have an abundance of foul brood now, which, indeed, would be equal to a calamity to the interest of bee-keepers in this country. I hope brother Jones will be spared.

But he was honest in his belief that he had foul brood. There are no two ways about it. I am sorry that Prof. Cook can not give a fair test of the matter. Unless our friends are aware of the insidious character of that disease, foul brood will keep spreading in this country, slowly but surely. Earnest and scientific men in the old country have devoted much time and labor to the matter, without being able to arrest the progress of the disease, and we who have it in our power yet to arrest the spread are indifferent, consoling ourselves with the idea that little boys can finish that job. I wish, indeed, you could name some good reliable party who could give us some facts, substantiated by his own scien-

tific tests in this matter. It might serve greatly toward putting our friends on their guard, and to arrest the spread of foul brood, which is in its infancy yet in this country. CHAS. F. MUTH.

Cincinnati, O., Apr. 13, 1883.

Below is the card alluded to:—

Dear Mr. Muth:—I must refuse to receive the foul brood. It is within 30 miles of us. Should I bring a hive here, and then foul brood should appear around us, as it may at any time, I and the College would suffer, even though I was so careful that no spread from the colony sent me was possible. Practically, it makes no difference. I can go to it.

Lansing, Mich., April 11, 1883.

A. J. COOK.

### FOUL BROOD, AGAIN.

AND SOMETHING A LITTLE MORE ENCOURAGING.

ON page 171, Vol. XI. of GLEANINGS, Mr. Muth appears to have but little faith in Mr. Jones's method of curing foul brood, and has made a wager of \$50.00 that Prof. Cook can not succeed in curing a diseased colony under Mr. J.'s instructions. Mr. Muth may as well draw his check in favor of his contestant, and become a convert to modern methods of treatment. More than 500 cases of foul brood have been cured in this vicinity within the past five years. The German remedy in the application of salicylic acid, as well as Mr. Muth's modified treatment, were given a most careful test by several of our apiarians here in 1877. But little benefit was derived, and those methods were abandoned. Our method of cure has been in substance the same as described by Mr. J. S. Harbison in GLEANINGS, p. 337, Vol. IX.; by Mr. G. M. Doolittle, same number, and by Mr. D. A. Jones, p. 535, Vol. X. I have cured about 125 cases in my own apiary. Last season not a sign of the disease was observed, and but one affected colony the year previous. Some of my neighbors have been equally successful.

Now, Mr. M. may say that we had a mild type of the disease. Well, we had cases which would have made Mr. Muth apply a clothes-pin to his nasal organ were he present; if that be mild, we want no further introduction. Mr. M. has, for several years, been an earnest advocate of the use of salicylic acid as a remedy, and in so doing has favored the spread of this infection, in the writer's opinion. Why be so incredulous when he has had the above authorities and others besides? We hope to see Mr. Muth take a new position upon this subject, after paying so dearly for his knowledge. But should he still continue skeptical we should be most happy to give him from one to five hundred dollars' worth of additional information on the same safe terms.

When there is honey in the fields, I prefer caging the queen in the infected colony in the morning, using a small wire cage. Place the caged queen between the combs of her hive. About sunset, brush the bees from the combs into a clean hive having a few empty frames. Brush them off as quickly as possible, that they may have but little opportunity to take the diseased honey with them. Suspend the cage to one of the middle frames, and leave the entrance of hive open. In four or five days transfer the bees rapidly to clean hive, using comb fdn., and release the queen. Give no empty combs for a few days, and there will be no further trouble. The

starving process is equally effective when properly conducted.

In all operations upon diseased stocks we would most strongly enjoin the greatest caution in promptly scalding hives, frames, combs, brushes, cages, knives, etc., used. Since there are so many careless bee-keepers, as well as those who are entirely unacquainted with foul brood, and others who will not believe it contagious, we think each State should afford the bee-keeper security in his property by the passage of appropriate laws. Our State legislature has recently enacted the following law:

#### AN ACT.

To authorize the Boards of Supervisors of the several counties of this State to appoint inspectors of apiaries, and provide for their compensation, and defining their duties, and for the further protection of bee culture.

The People of the State of California represented in Senate and Assembly, do enact as follows:

SECTION 1. The Board of Supervisors of any county wherein bees are kept, are hereby authorized to appoint one or more persons as Inspectors of apiaries, to hold office during pleasure of said Board.

SEC. 2. The Board of Supervisors shall fix and determine the compensation of the Inspectors of apiaries, to be paid out of the funds of the county not otherwise appropriated.

SEC. 3. Upon complaint being made to the Inspector, to the effect that in complainant's opinion, the disease known as "foul brood" exists in any apiary in that county, it shall be the duty of such Inspector to inspect such apiary as soon as practicable, and direct the person in charge thereof to destroy all hives ascertained to be so affected, together with the combs and bees therein, by burning or burying the same in the ground the following night.

SEC. 4. If the owner or person in charge of an apiary, by his own inspection or through any other source, discovers foul brood in any hive in said apiary, it shall be his duty to destroy such hive and contents in the manner provided in section three of this Act.

SEC. 5. Any person failing to comply with the provisions of the last section shall be deemed guilty of a misdemeanor, and upon conviction thereof shall be punished by a fine of not less than five dollars nor more than twenty-five dollars for the first offense, and by a fine of not more than fifty dollars for each subsequent offense.

SEC. 6. This Act shall take effect from and after its passage.

San Bernardino, Cal., Apr. 10, 1883. M. SEGARS.

### BEE-KEEPING FOR WOMEN.

OUR GOOD FRIEND MRS. HARRISON HAS SOMETHING FURTHER TO SAY ON THE MATTER.

I HAVE enjoyed the discussions that have been in GLEANINGS with reference to bee-keeping being a suitable employment for women, and have no doubt but that it will be promotive of much good. Supply dealers will put upon the market light and easily adjusted fixtures, especially adapted for persons of little strength. I claim this much for women: although they may be lacking in physical strength, they are "brainy," plenty; and as for courage and endurance, they would outrank the other sex every time. There is one side to this discussion that is overlooked by those who advocate that it is "too hard for women," and that is, what have they to give us in lieu of bee-keeping? It is like the infidel who would take away the Bible, but have nothing to give in place of it.

Something that women can do at home, which has a money value, is sought for the world over by those endeavoring to elevate the sex. We might raise silkworms, and have no trees to climb to take them down, or heavy hives to carry; but would it be any easier, to be up all night feeding worms? Honey is heavier to carry than cocoons, and so is the money for it. I know it is difficult to have colonies clustered on stumps, rail fences, and in lofty forest-trees, as the sisters Linswik have done. Others differently situated have fewer obstacles to contend against. We have a honeysuckle and wisteria that are supported by large sassafras-trees that had the tops cut off, and set in the ground like posts. When bees cluster there it is almost as much as they are

worth to hive them. Early May cherry-trees have been the most popular clustering-place for our bees, and they are low.

Persons have to be governed by their surroundings in keeping bees. If I lived in the country, I should manage quite differently than I do here in the city, where I have to guard against making them cross. I should not be writing this moment, if workingmen were not laying pavement near, for it is a warm still day, and I want to open hives. I've noticed that beer-drinkers, and those who use tobacco, are more apt to be stung than other persons.

#### HONEY VINEGAR.

Will some of the sisters "Bee" give their experience in making honey vinegar? What I've made has a peculiar taste. I can not disguise it in any shape, so that my family will not know it. "More of that honey vinegar, hey? wish you would throw it out. Plenty of apples in Illinois to make vinegar out of."

MRS. L. HARRISON.

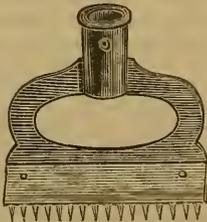

Peoria, Ill., April, 1883.

Thank you, Mrs. H. There is certainly much truth in what you say about occupations for women. I don't know about silkworms, and they may be all right; but I do know that many of our feminine friends keep bees, and make money at it; and the best part of it is, that they enjoy excellent health, and are happy in their work. Any work may be hard work; and especially is the work hard when the heart is not in it. You have given us something on honey vinegar a little on the other side, my friend. Has any one else had any such experience?

#### FASTENING FDN. INTO THE WIRED FRAMES.

STILL ANOTHER WAY.

**W**E have just had a very pleasant visit from friend McGee, of Marblehead Point, O. A little sketch of his bee-keeping is mentioned on page 259. Well, among other things that we learned from friend McGee was a plan for putting fdn. into the wired frames, which we think is going to do entirely away with the button-hook, or soldering-iron arrangement. It is simply a common carpet-stretcher, as shown in the accompanying cut.

IMPLEMENT FOR FASTENING FDN. INTO THE WIRED FRAMES.

No lamp or heating is required. The fdn. is laid on the wires, with the wax at ordinary temperature. Of course, the work should be done in a room ordinarily warm. To imbed the wires into the wax, you have only to lay the points of the carpet-stretcher on the wire, and press it down firmly, the fdn., of course, being supported on a board in the

usual way. The width of the carpet-stretcher is such that pressing down twice fastens the wire the whole length, and one who is a little accustomed to the work will do it even more rapidly than with the heated copper, as we have been doing it. A short handle on it, not shown in the cut, is used. These carpet-stretchers can be furnished for 15 cts. each, handle and all. If sent by mail, 25 cts. Many thanks to friend McGee. The wire is so thin that the pressure makes it cut its way clear down to the center of the sheet of wax. The points touch it at short intervals in such a way that few if any of the walls of the cells are injured; and friend McGee assures us that drone-cells are never built on the wires, which is sometimes the case with almost all other methods of imbedding the wires into the wax sheets. We think frames of fdn. put up in this way will ship even more safely than the way we have been doing it.

#### HOW TO MAKE A CUT-OFF SAW-TABLE.

ALSO SOMETHING IN REGARD TO THE MATTER IN GENERAL OF CUTTING OFF BOARDS.

**I**T will be remembered that in the A B C book we described minutely buzz-saws and buzz-saw tables for ripping lumber. We also told how saws were made, and filed for cutting off lumber. Now, where the bee-keeper has but little to do in the way of hive-making he may cut boards on the same table that he uses for ripping. The usual method for doing this is to place the board on the figure 4, according to A B C, and as seen on page 583 of GLEANINGS for Dec., 1882. But in order to work this way, he must have somebody to hold the end of the long boards while he cuts them up, or have some sort of a support on which they will slide over easily.

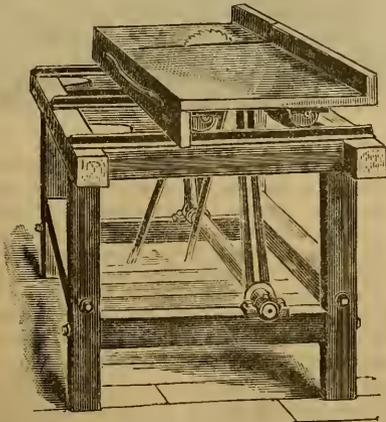

When I used to make all my own hives with a single saw-table, and my saws were run by a windmill, as some of you may remember, I used to have the further end of the board slide on a smooth rest made of a piece of hard wood. With this I could take a 16-foot board, and, without any assistance, cut it up into pieces long enough for hives or covers, and have them so exact that, when piled up, no difference in the length could be told by passing the fingers over the ends. Now, while I could do this day after day, and really enjoy the work, I could not find any one who would do it for me. If I set a couple of boys at it, the one with the other end of the board would move it too fast or too slow, or by jerks, in such a way as to have the pieces, when cut off, of unequal lengths. Then we tried cutting the board up first into pieces long enough for two or three lengths for hives; and then as these pieces were short enough to handle, it was an easy matter to cut them up into exact lengths. This, of course, took a great deal more time; and even then the boards would not be cut squarely across. The reason was, that although the edge of the board might be held closely up against the figure four, unless at least one side of the board was perfectly straight, like a straight-edge, before

being cut up, we found trouble after we got through.

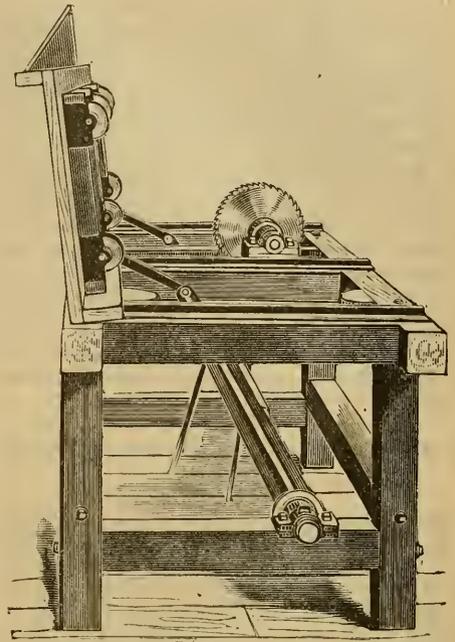

There is a way, however, in which a board can be cut up into accurate lengths, even if its sides are not straight. Fix a straight-edge of steel (nice hard wood may do) back of the saw just far enough away to get the length of board wanted. Hold it hard up against your figure 4 and cut off a board once, squarely across. When you have done this, hold the square cut hard up against the steel straight-edge. Now push the board along on the top of the table up against the saw, watching carefully to see that the end is a perfect fit against this steel straight-edge. In this way you can cut up a whole board and have the pieces exactly of the same length. But woe betide you if you are so careless as to leave a crack on either edge, even if it be not more than a hair in thickness. You see, we want the boards so accurate that where there are two stood up together on a smooth surface, neither eye nor finger can detect any difference in the length. In making frames for the hives, this is a most important matter; indeed, I have had nothing in the whole department of hive-making that has caused me so much trouble as this matter of getting hands who would cut stuff *perfectly accurate*. Many times I could have cried about it (if you will excuse a little exaggeration), had I thought it would do any good.

We are now ready to consider what may be done by the use of machinery, for enabling even unskillful hands, or, perhaps, hands who have never been shown the importance of accuracy in mechanical work, so that they may do work and be exact. When at the Exposition at Cincinnati, last fall, I saw some beautiful iron tables having a pair of saws. These saws could be adjusted at any required distance from each other; and to cut off the board it was pushed against the saws while moving on a carriage of iron. This, you will see, made it next to impossible to have boards cut either too short or too long; but the two cuts every time, made a small waste of lumber.

Below we give you some engravings of the cut-off tables we use in our own factory. I don't know whether exactly the same device has ever been used before or not.

A SAW-TABLE FOR CUTTING OFF STUFF.

THE SAME WITH TOP RAISED.

No. 1 shows the table ready for work, and No. 2 the same with top elevated, which can readily be done to take off saws, etc. It occurs to me just now that our artist has made a mistake, and drawn a rip-saw where he should have shown a cut-off or cross-cut saw, as it is sometimes called. The table is made of 4x4 seasoned maple. On the top are placed three cast-iron V-shaped tracks. The sliding top runs on these tracks on 6 cast-iron wheels having a V-shaped groove in each. This, you will observe, makes the sliding top of the table so that it moves to and fro with great ease, yet without a bit of end shake. At a first glance one would almost think this sufficient; but if you were to lay a 16-foot plank on this sliding table-top, and take hold of the end, you would find it would have a considerable twist, or "wiggle," on its center. This twist would, of course, prevent cutting off the boards accurately. Now to make the table rigid where it stands, and still bear sliding to and fro, we have what is termed a rocking-shaft. This is a cast-iron shaft about 2½ inches in diameter. Don't make it any smaller, thinking it will do. Better have it larger, if any thing. On this shaft is a pair of rigid cast-iron arms, as you see in the cut. At the top of each of these arms, short iron bars are bolted; and these bolts are attached to the movable table-top. Now, providing these bolts all work closely, we have secured our table so that no twist is possible, unless the shaft should twist. But a 2½ iron shaft can not be expected to do this very much. A handle is attached to the sliding top, as you will see in the cut, for drawing it back easily. We have two of these tables in use—one about 10 feet long, and the other about 8, and they are in use almost constant-

ly. Of course, an iron gauge which can be adjusted at any required distance from the saw is a great help for cutting different lengths of lumber. And as before, your stuff *must* be held *tight up* to this gauge. Such a table, well made, ought to cost perhaps \$45.00 for the short ones, or \$50.00 for the long ones, as described above. If made as we have directed, it should, with a mandrel of proper size, be capable of carrying a 12 or 14 inch saw, and should cut up heavy planks used for chaff-hive corners, or such as will be required for slicing up wood into separators, or any similar work. Where inch boards are to be cut, or any thing thinner, we pile them up until we get as many as the saw will reach through. By this means we cut three or four, or even more, where the lumber is thin, at one cut, and one person handles it all easily.

### FACTS AND FALLACIES IN API CULTURE.

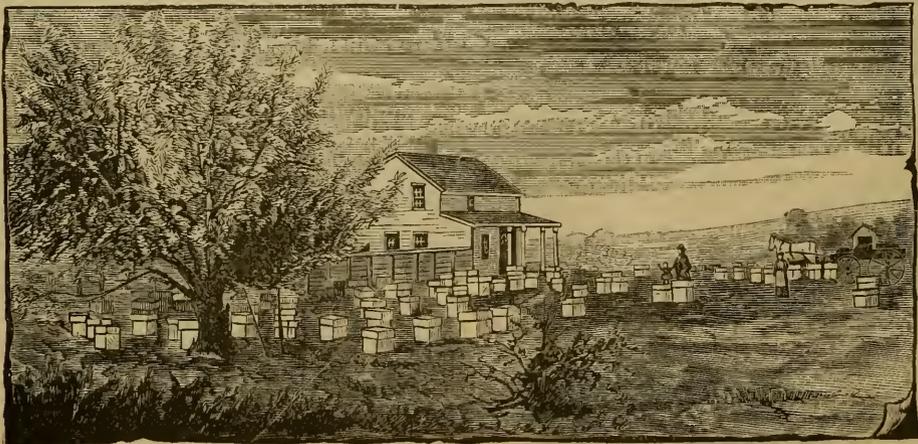

FRIEND WILTSE'S APIARY, ETC.

**T**O take the photograph, a team was driven some 20 feet back of the small apple-tree in the foreground that obstructs the view of a few of the near hives, and the artist placed himself in the wagon, facing his instrument toward the house. It was at 4 o'clock P.M., on the 26th of October. Not a breath of air was stirring. A patch of spring rape near the ravine had withstood the effects of a temperature of 24° on the morning of the 18th, and was still furnishing honey. The bees were flying briskly.

east and west, and 20 rods north and south, is inclosed with an osage-orange hedge. Eight rows of apple-trees are planted across the west end of the patch (two of the trees show in the photograph), and six rows extend along the north side some rods beyond the house. Beyond these, in the north-east corner, is a vineyard containing 600 vines. The apiary is 'on the south half of the patch; south of the center. At the north-east is the house, and on the east a dozen or more cherry-trees. A tight board fence is on the north side. In the distance, on the north-east and east, are two rows of forest-trees along two water-courses. Several other water-courses, skirted by timber, are within the bees' range of flight. The ground on which the apiary is located descends slightly to the south-west. The fence and the trees check the force of the winds from all sides but the south. No shade is provided for the bees.

### THE HONEY-PRODUCING TREES AND PLANTS OF NEBRASKA.

We can reasonably expect surplus honey from basswood, from the 5th of June to the 10th of July; from English smartweed, from the 8th of August to the 10th of September; from buckwheat, from six weeks after it is sown to the time it gets ripe. We may hope for honey in limited quantity from alsike clover, from May 15th to June 10th; from sumac (*Rhus glabra*), from June 12th to July; from sumac (*R. Capillina*), from July 15th to August. When all the conditions are right, nearly all kinds of trees and many kinds of plants furnish light flows of honey; and nearly all furnish pollen. Without one or more of the above-mentioned trees or plants in

APIARY AND RESIDENCE OF JEROME WILTSE.

We had been uniting queenless stocks of bees with those having queens, and setting the empty hives at the front, and, as a consequence, open spaces are left, and the apiary has a straggling appearance. The blue-grass, with which the ground is covered, obstructed the view of the entrances, and the bees do not show. The hives near the trees, though beyond the extreme limits of the limbs, appear to be under them. Every thing appears to be depressed in height, and extended in width. In other respects the appearance is all right.

The apiary is located three and a half miles west of the Missouri River, and five and a half north of the Kansas line. A five-acre patch of land, 40 rods

abundance, and enough other trees and plants from which honey and pollen can be expected to furnish the necessary food continuously, or nearly so, within the range of flight of the bees of an apiary, it is useless to station in this section of country. The following incomplete list of the more important trees and plants for the last three years, given in the table below, will give a correct idea of how atmospheric changes have affected the trees and plants of the country.

COMPARATIVE TIME OF BLOSSOMING, FOR THREE YEARS.  
Names of Trees and Plants, and what they Produced.  
1880.—March 3, hazel; pollen. 25, maple; honey and pollen.  
April 2, white-willow; honey and pollen. 18, apple, plum,  
June-berry, cottonwood; honey and pollen. 20, red-bud;  
honey and pollen. 27, oak; pollen.

May 6, wild-cherry; honey. 8, black-loeast; nothing. 12, red-willow; honey and pollen. 16, red, white, and alsike clover; honey. 23, wild-grape, honey. 27, dogwood; honey and pollen.

June 9, sumac; honey and pollen. 16, basswood; honey.

July 15, sumac; honey and pollen.

Aug. 8, English smartweed; honey and pollen.

1881.—Apr. 16, hazel; pollen, the first of the season. 20, white-willow, red-elm, maple; honey and pollen. 23, June-berry, cottonwood; honey and pollen.

May 15, wild-cherry and black-haw; honey and pollen. 18, black-loeast; nothing. 23, red, white, and alsike clover; honey.

June 13, sumac; honey and pollen. 15, basswood; honey.

July 13, sumac; honey and pollen.

Aug. 28, English smartweed; honey and pollen.

1882.—March 1, hazel; pollen. Maple; pollen and honey. 14, red-elm; honey and pollen. 23, white-willow; honey and pollen.

April 3, cottonwood, plum; honey and pollen. 7, apple, cherry, honey and pollen. 9, June-berry, red-bud; honey and pollen.

May 2, red-willow, gooseberry; honey and pollen. 4, oak; honey and pollen. 6, wild-cherry; honey. 19, white, red, and alsike clover; honey. 31, blackberries; honey.

June 11, rape; spring honey and pollen. 21, bees starving. 23, sumac; honey and pollen. Sweet-elder, nothing. 25, basswood; honey. 30, sweet-clover; honey.

July 17, sumac; honey and pollen.

Aug. 7, English smartweed; honey and pollen.

Having ascertained that the necessary plants are within the flight of the honey-bee, should the establishment of an apiary be determined upon, the habits of the bee should be studied closely, with a view to choosing a site where it would be encouraged to develop its habits to the fullest extent, and be protected from the cold winds.

Falls City, Neb.

JEROME WILTSE.

## Ladies' Department.

### AN A B C SCHOLAR'S LETTER.

ALSO SOME GRAINS OF WISDOM FOR VETERANS.

**M**Y bees have all wintered nicely, notwithstanding the severity of the winter. They were on summer stands, with chaff cushions on top of the frames, and solid sheets of honey at the sides in place of division-boards. Although they suffered badly from the dysentery during the latter part of the winter, yet they do not seem to be materially injured by it, as they are now strong and in fine condition. They are carrying in large quantities of pollen to-day.

#### HONEY THAT WON'T GRANULATE.

Last year's crop of honey, 1500 lbs., is all sold, and I could have sold much more if I had had it. Out of 1200 lbs. extracted, I had only about 15 lbs. that granulated, and that was basswood honey taken in July. We did not put any of our honey in barrels last year, neither did I strain any of it.

#### STRAINING HONEY.

I consider straining honey unnecessary labor. On extracting, our honey was put into large tin cans (such as are generally used for lard), and kept in a warm room for a few hours, when all impurities would arise to the top, and were easily skimmed off. The small amount of honey skimmed from the cans, and that with the cappings, was used for making vinegar. If I were going to barrel my honey, I think I should save both time and labor by skimming rather than straining it.

#### DEVELOPING THE HONEY MARKET.

With the exception of about 400 lbs., our honey was all sold in or near our own town, mostly in bulk, as the purchasers generally prefer to furnish the vessel to be filled. With the little experience that I have had in selling honey, I think the best way is to sell from samples, never handling the honey except to deliver it.

#### HANGING OUT, AND THE REMEDY.

While reading GLEANINGS I see a good many complain of their bees lying out in summer. I think this is more frequently caused by their being in need of room to store honey, than from a lack of ventilation, as many seem to think. I noticed during the past season that when a colony was found lying out (if for a single day only), on examination they were invariably found in need of more room; and by the frequent use of the extractor, and by removing the surplus boxes as soon as filled, replacing them with empty ones, our bees were kept busily at work during the entire season, regardless of the heat, notwithstanding a part of them were very poorly shaded.

#### RAISING HONEY-PLANTS, AND THE SATISFACTION IT GIVES.

I think with a very little care and attention any person can greatly improve the natural resources of honey in his own neighborhood. Three years ago I had to go a mile from home to find a few Simpson plants, which I transplanted to my garden, and from which I have saved seed and scattered by the roadsides and waste places, until now you can scarcely go ten rods from the house in any direction without finding an abundance of them. And not only the Simpson plant, but catnip, motherwort, etc. And now, friend Root, you can realize what a joy it is to me; how it fills my heart with gladness, to see my pets sipping the nectar from the flowers that have sprung from the seed that I have sown. If any of our friends want to see swarms of all the honey-loving insects in Christendom, just let them plant a patch of Spider plants, and I think they will be satisfied with the result of their labor.

SARAH E. DUNCAN.

Lineville, Iowa, April 7, 1883.

I am much pleased, my friend, with your closing remarks. I agree with you, that even if honey-plants do not pay in dollars and cents, they pay in the satisfaction one receives seeing the honey secreted, and the way in which the bees take it. It seems to me it would pay bee-keepers to have at least a few plants of the figwort and spider plants; then if they want to raise them by the acre, they will know all about how to do it.

#### MRS. AXTELL'S DISCLAIMER.

I was very sorry that I made myself so prominent that you thought I was manager of this business, in so much that you headed the articles, "The Results of One Woman's Bee-keeping." I fear our neighbors will smile a little. I do much of our writing, and most of the "blowing;" but Mr. Axtell is manager of our apiaries, farm, business, and all, and I am very glad we have got a head, for I am sure I could not carry it alone. As his health is not good, I try to help him in every way I can, as he has other duties to look after besides his own. Indeed, I do not see how a man can be a prosperous bee-keeper, if his wife doesn't take hold too, and do her share of the work; for it seems to me the work is just as well adapted to women as men.

SARAH J. W. AXTELL.

Roseville, Ill., March 5, 1883.

#### MAPLE SUGAR FOR BEES.

In the March No. of GLEANINGS, page 133, under heading of "Maple Sugar for Feeding," I beg leave to make a few corrections. I did not expect my report to be published, and I either did not give all the particulars about feeding, or the reporter failed

to get it. That article, I judge, gives the impression that 1½ lbs. of maple sugar was all I fed, which is not true; and for fear it might mislead some A B C scholar, I wish it corrected. In February I gave each colony 2 frames of capped honey, Langstroth size; and when the frost killed the fruit-bloom, for fear brood-rearing would stop I commenced feeding each colony half a pint of syrup made of granulated sugar, daily. I continued that about a week, when my bee journal came and I saw in that a little article recommending maple sugar for feeding. I got right into the buggy, went to the city, procured 45 lbs. in cakes, gave each colony from 1½ to 2 lbs. each, which carried them through to the clover-yield of honey. I had on hand frames enough filled with comb to keep the bees busy gathering honey, and they did not have to waste any time building comb; also enough to give each new swarm a full supply; hence my success.

JENNIE CULP.

Hilliard, O., April 11, 1883.

No wonder you succeeded, my friend, if you kept your bees going in that way. To be sure, it will pay to keep brood-rearing going. It always does.

We commenced our bee-keeping six years ago with one hive; but, thanks to the A B C book, we transferred them 3 years ago. In the summer of 1881 we got over 1000 lbs. from 8 hives, spring count; last year we got only about 850 lbs. from 13; had to feed 150 back; also 70 lbs. sugar. I have 21 hives now fixed up as snug as we could make them.

Mrs. THOS. BLACK.

Heathcote, Ont., Can., Feb. 3, 1883.

### THE COMING BEE.

ALSO A FEW "REMARKS" IN REGARD TO REMOVING BEES FROM CELLARS.

**T**HIS subject has been discussed so many times that I should not touch it, were it not from the fact that I have seen it. I saw it yesterday. In fact, I saw several of them. They saw me, too — I mean some of them did, and the rest felt for me, and they found me. I felt them without feeling for them either. My feeling so pleased them that they called in their sisters, cousins, and aunts, to feel of me also. They came, they saw, they felt. I felt, too — in fact, I feel yet.

This is how I came to see,  
And feel the points of the coming bee.

They were in the cellar, where they had been for only the short period of 157 days and nights, amiable, gentle Italians, as I supposed when I tucked them in their little beds in the fall. My cellar was dark. They could not see; so I suppose they had got accustomed to feeling. May be that accounts for the fellow-feeling they manifested for me. I carried out colony No. 1, sans hat, sans coat, sans gloves. The "coming bee" at once dawned upon my vision. She felt of my hands, felt of neck, felt of my hair, and felt of my whiskers. She sang a song in bee-sharp which attracted all her female acquaintances. They improvised a jubilee concert on the spot. I was the only interested auditor; and as soon as I could "unload my stock" I "clapped." They appreciated the cheering, and sang louder. They called in some of their finest Italian opera-singers and performers. That music is not usually understood in this country. The clapping is generally done because it is fashionable to applaud every thing that is foreign. But I understood every demi-semi-quaver. I clapped with the spirit and with the understanding

also. But I felt that they were expending too much talent on such a small audience, so I retired as gracefully as the overwhelming attentions being paid me would allow.

*Intermission of 15 minutes. Curtain drops.*

It is usually customary for the actors to change costumes while the curtain is down. In this instance, however, the audience changed dress. The next act begins when I carry the second colony out of the cellar. This time I am prepared for the coming bee. Armed with straw hat, bee-veil, and gauntlet gloves, I look like a cross between a knight-errant, a sister of charity, and an honest granger. With my gauntlets drawn snugly around the arms with rubber cord, and the veil ditto around the neck, now let 'em sing, sang I. They sang again; and as the wind gently pressed the tarlatan against my nose, one of the foremost of the Italian singers sat down to rest on the ornamental part of my face. As I had no one to help me let go of the hive I was carrying, and as I was in somewhat of a hurry, I allowed the Italian miss to keep her seat. All at once she doubled up like a boy who has eaten too many green cucumbers; and as if afraid of falling off, she drilled my proboscis with her little gimlet. Others of her companions, hearing of her distress, came to see what was the matter, and sat down also. And as there was not sitting room on my front porch for all the sympathizing friends, some of them crowded between my veil and the place where my shirt collar ought to have been, and came up on the inside for a closer interview. By the time I had reached the yard, my neck felt as if I had undergone treatment for sore throat with counter-irritants. Then if you ever saw a cat trying to pull a mitten off its head with its fore paws, you can imagine how dignified I looked. Instead of being the audience, I was now one of the chief performers, while my wife, sitting in the bay-window, was the interested and amused spectator, enjoying the show as much as our boys did Barnum's Hippodrome. I created as much interest as a whole menagerie, when the animals had just been "stirred up." The performance lasted only about an hour, and closed amid the wildest enthusiasm.

Don't talk to me about the *Apis dorsata*. If their *gimlets* are any longer than the ones I felt, I'll be excused from buying any. Tell Jones he had better call Frank Benton home. I have lost all interest in the "coming bee."

EUGENE SECOR.

Forest City, Ia., April 17, 1883.

Now, friend S., that is really too bad, for it awakens in my recollection unpleasant reminiscences, and that, too, just at an unlucky time, for you know I have been thinking much of late of having at least some of my bees in a cellar next winter. You almost make me decide to stick to chaff hives, and stronger colonies.

## The "Smilery."

**D**ON'T you think we had better speak for one corner of the "Smilery"? We can say smilingly that we have succeeded in wintering our 100 swarms of Italians without the loss of a single colony? We set them out of the cellar Apr. 3 (in the evening). None are queenless.

D. E. L'HOMMEDIEU & BRO.

Colo, Story Co., Iowa, April 7, 1883.

### OUR OLD FRIEND I. R. GOOD.

WHAT HAPPENED, WHAT HE DID, AND WHERE HE IS NOW.

CHATTANOOGA, TENN., MARCH 15, 1883.

**W**ELL, I have been to see J. H. Thornburg's apiary. It is about half way up Lookout Mountain; found him at home among the bees. He is getting ready for queen-rearing. There is considerable new honey in his hives, and drones are flying as in mid-summer. Friend T.'s apiary is on the battle-field of Lookout Mountain. He has found many relics of the war, in the shape of shells and cannon-balls. Friend T. thinks his health has improved very much since he moved to where he now is. He is consumptive. We are going to Alabama from here.

TULLAHOMA, TENN., MARCH 21, 1883.

This is a thriving town of three or four thousand inhabitants; quite a manufacturing town; from general appearance I believe it to be a good place to establish an apiary. I am thinking very strongly of locating here. I have been out to see T. A. Gunn. He lives three miles from Tullahoma; found him at home in his shop, getting ready to commence making hives and sections. He is a gentleman whom it is a pleasure to meet — full of bee talk. He keeps but few bees at present, as his time is much taken up in his shop. He thinks this is the best place for bees in the State. He has taken 100 lbs. of aster honey to the colony — comb at that.

INDIANAPOLIS, IND., MARCH 23, 1883.

Stopped to-day seven hours with our friend J. M. Brooks, Columbus, Ind. Friend B. has had splendid success wintering his bees this winter. I believe he has not lost a single colony this winter. He has been in the habit of wintering in the cellar until this winter. He thinks bees wintered in the cellar year after year are not as hardy, and will not work as well as those wintered on their summer stands. He also thinks that those beautiful light-colored Italian bees are not as good workers as the dark or leather-colored ones. He says he is not going to breed for "yaller stripes," as Judge Andrews says, any longer; but from this on is going to breed for business.

THE HOLY-LANDS FOR WINTERING.

I think I have told you before that I put about one-half, or about 115 colonies of bees in my cellar last fall, the other 110 colonies in chaff hives. In taking my bees out of the cellar a few days ago I found live bees in about 30 hives. The rest were dead, and the combs moldy and in bad shape. Out of the 225 prepared for winter in the fall, I have now remaining about 80 colonies, good, bad, and indifferent. You need not ask me what I think was the cause of the bees' dying, because, candidly, I do not know, unless it was on account of moving them last fall after cold weather.

Again the Holy-Land bees have proven themselves to be the most hardy, as the Italians are all dead except a few very weak colonies. I had about 80 colonies of Italians last fall. I have a brother who has a Holy-Land apiary of 30 colonies only 40 rods from my own apiary. He wintered his bees on their summer stands, and lost but one out of the thirty. The rest are nearly all in good condition, and very strong also.

In a letter from friend H. Alley, March 30, he says: "Have not the Holy-Land bees wintered best with you? They have with me. The Italians are the

poorest race to winter we have, and I am going into Cyprian and Holy-Land bees largely." At another place he says: "I tell you, the new races will sweep the board sooner or later."

I shall not breed any Italian queens for sale this year, as I have lost all my Italian bees. If nothing happens, I think I shall be able by next spring to help furnish you early queens. We are having snow, frost, and ice here yet. Our bees have not had a smell of pollen this spring. I. R. GOOD.

Nappanee, Ind., April 9, 1883.

### IS IT PROBABLE THAT BEES EVER FLY 18 MILES TO FIND A NEW HOME?

SOME CURIOUS FACTS ABOUT RUNAWAY SWARMS.

**I** THINK not, nor half that distance. Bees often locate in queer places. I have found them in chimneys of old forsaken houses, and even in chimneys that were used in winter; in the attic of an old building, beneath the floor; in a hollow log lying on the ground. I once followed the "bee-line" about two miles to find the swarm building comb under a rather small tree that had fallen into the crotch of another, at an angle of about 45 degrees. It had no protection, and yet had been there for months, I judge, from the amount of comb they had. One swarm was lined by a number of bee-hunters to a swamp of brushes, where there were no large trees or old logs in which the bees could find a home, and sought for in vain, till the idea popped into my brain that something had been left on the ground which furnished them a retreat. With this thought as a guide I took the trail and found them in a large rabbit-trap, or box, which some boy had set there years before and forgotten. As it was entirely filled with old comb it must have been there two or more years, sending out its new swarms.

I do not think I ever lined bees more than about three miles from their home. I once went upon a hill and caught quite a number of bees and set them at work upon the bait, and from that one spot lined five colonies to their hiding-places. But one of the five was over two miles away, and most of them were within one mile of this hill.

HOW TO TELL HOW FAR OFF YOUR BEE-TREE IS.

It is easy to determine the distance of any swarm, when you once get the bees well at work. Take some bees from near a hive, and carry them a mile away from their home. Set them at work upon their bait; and when they get well settled down to their business, take a bit of chalk and scrape a bit into your hand; moisten it, take a minute globule on the end of a small straw, or bit of grass, and touch a bee on his back, and it will stay there for days. When he starts for home, take out your watch and put down the exact time he left. When he comes back into your box, note the time of absence. Test this a number of times, and you will be surprised to see how slight a variation there is. Then strike an average, and you will get very nearly the time it takes bees to go a mile, unload, and return. You will soon learn how far away, or nearly, your swarm is. Of course they will not be twice as long in going two miles as in going one, for it takes no more time to unload in the one case than in the other, and will fly two miles while he is crawling into his tree and depositing his honey.

I have no doubt many colonies exist in these out-

of-the-way places, and are overlooked because most persons look for a large hollow tree as the home of the hunted swarm, and this accounts for the fact that so many Italian queens are fertilized by black drones, when it is supposed all the colonies within two or three miles are Italianized.

Andover, Mass.

L. H. SHELDON.

Many thanks for your last item, friend S. I have often guessed about how far the bees had to go in the way you indicate, but you have almost reduced it to a science.

### A CIDER-MILL BUZZ-SAW.

DO WE WANT A BELT ON A HAND-POWER BUZZ SAW?

**I** SEE in March GLEANINGS, page 142, that H. H. Lay wants a hand-ripper. Well, I have one, only it is a cider-mill buzz-saw instead of a corn-sheller; that is, I have the wheels of an old cider-mill. I got a rod to fit the hole in the small cog-wheel and the fly-wheel, and had two journals turned in it to suit a boxing I had. I then had a screw cut on one end. I screwed one nut on, and turned it true with a file; put on the saw, and another nut against it. I have it so that, when turning with my right hand, the saw turns toward me. The small wheel turns three times to the large one once; fly-wheel weighs 25 lbs. It is 13 inches between the saw and fly-wheel, which does very well for ripping, but would have to be further for a cross-cut. I have a 12-inch saw, but think a 10-inch would do much better. I can saw my own separators, and flatter myself that they are nearly as good as yours. The saw will cut  $3\frac{1}{4}$  inches. A friend gave me the old cider-mill, and the shaft that the saw is fastened to cost me 95 cents — a good deal less than \$50.00, and I think it will do half as much work as a \$50.00 ripper.

Tell friend Kingsley to throw his belt away and fasten the saw to the shaft that the fly-wheel is on. I have tried both ways. I make all my hives, sections, frames, and separators, and enjoy the work.

J. W. BRADLEY.

Columbia, Mo., March 24, 1883.

### USING PARAFFINE WITH WAX, IN MAKING FOUNDATION.

CAN IT BE USED WITH WIRED FRAMES?

**I**N looking over GLEANINGS for 1882, in the June and July numbers I notice what is said about paraffine being used in wax. I know of a party who made fdn. to sell last season, who began by putting 5 per cent of paraffine with the wax; and before the season was over, he was putting in 20 per cent, and I used over 60 lbs. of the fdn. in my own apiary, and the bees worked out that with the most paraffine in more readily than the other. I was not troubled with sagging, but my frames are all wired, 6 wires to a Langstroth frame. I don't see why — and others should "get their backs up" because paraffine is used: it is certainly cleaner than wax, and what difference does it make what we use for fdn., if it works just as well as wax? What I knew of being used last year was not used to save money, but because it made the wax work much nicer, and the paraffine cost the same as wax.

If you want to use the above in GLEANINGS, leave out the postoffice and my name; not on my account, but it might possibly injure the manufacturer I speak of, the same as was the tendency when you

spoke of its use. It is not three years yet, I believe, since I was told that a large manufacturer of fdn., "not more than a thousand miles from Medina, O.," bought a large quantity of paraffine in Toledo, perhaps to be used in coating honey-barrels. I believe you will come out ahead, if you stick to paraffine.

As a general thing I dislike to publish any thing without a full name and postoffice address appended thereto; but for reasons given above, I have decided to use this. If I am correct, there is quite a difference in the melting temperature in different brands of paraffine. Some of it will almost melt by the heat of the summer sun, while other lots have the melting temperature almost as high as wax. I can readily believe that this latter could be added to beeswax in a quantity a great as 20 per cent, and even more, without detriment, for wired frames. We purchased about a ton of paraffine several years ago, but not a pound of it (aside from my first experiments, which I have reported), has ever been used for making fdn. We use it for waxing barrels, and sell it to bee-men for the same purpose. As wax is now 35 c. or more, and paraffine as low as 20 c. in the quantity, it begins to be quite an object to have some decisive experiments in regard to the matter. Fdn. made with a small per cent of paraffine is certainly worked by the bees faster than that of pure wax.

### DOES A SWARM EVER ISSUE AND GO OFF WITHOUT CLUSTERING?

AN "OLD FOGY'S" NOTION ON THE SUBJECT.

**I** SEE in your March No., p. 116, that Dr. S. S. Butler says he learned years ago that if the bees had room so that the whole of them could rush out they would sometimes start for parts unknown without clustering; and you, yes, you, friend R., in response to that, say, "I now recall to mind a swarm that went right out and off," etc. Now that beats me; are you sure it was a natural swarm, and did you actually see them go right out of the parent hive, and off without ever clustering, or even saying by your leave?

Now, friend R., you must excuse my skepticism on this point, for I have been acquainted with bees all my life (and I'm not a chicken by any means), and my father was a bee-keeper before me, under the old brimstone dispensation, and I have never yet in all my life seen a natural swarm come right out of the parent hive and go off without clustering; neither have I seen a man or woman who would say for certain that he or she had ever seen any thing of the kind. I have often heard people say they had seen swarms go off without "settling;" but when pinned down to the facts in the case, they invariably admitted that they didn't see them come out of the "gum;" but they were in the air when they first saw them. I, too, can "recall to mind" a swarm some 45 or 50 years ago that went right out and off, and the gum didn't have a very big entrance either; but they had swarmed, and we had bived them three or four times in as many different hives, and they would come out again and settle on a tree; but this time they went right out and off, and they didn't have their "new home" picked out either, for we followed them about a mile, and they alighted on the body of a tree that had no hole in it. We didn't

make any racket to bring them down or make them settle either; but we hived them again after they had clustered, and this time they stayed and did well.

I know there are still some "old-fogy" bee-keepers (?) in the country who think they have to make a "whale" of a noise to settle their bees when they swarm; but their number is growing beautifully less every year. I am aware that there are quite a number of progressive (?) bee-beepers who think it necessary to mutilate the queen by "clipping" her wing in order to save the swarm; but experience has taught me that it is unnecessary, and therefore a barbarous practice. In my experience of 35 years or more keeping bees, both on the old and new system, I have never, to my recollection, lost a swarm by absconding; but you say others have. Yes, I know it, and I have a neighbor who clips his queens' wings, and he loses two swarms and four queens to my "nary un."

Now let us read from I. Chron. 19:4. "Therefore Hanun took David's servants, and shaved them, and cut off their garments in the midst, hard by their buttocks, and sent them away." How does that strike you? OLD FOGY.

Allendale, Ill., April, 1883.

Friend F., I am sorry to say that I shall have to own up that I did not see a swarm come out and go off. The women folks saw it, or, at least, the circumstances are so direct that it seems a clear case. Now, if I am not very much mistaken, we have a score or more among our readers who have seen the first swarm come out and go off. Will such please stand up and testify? I should be very glad indeed if we could dispense with mutilating queens' wings. Friend F., did you read what our friend Cyula had to say on the subject of clipping the queens' wings, in our last number? Are you not a little uncharitable? And is not your proof a sort of negative proof? We grant that in all of your experience you never saw a swarm go off without clustering; but is such proof sufficient to maintain the strong position you take? At any rate, we should be glad to have the truth brought out again, even though the subject was discussed and dropped as settled, years ago.

### WINTERING REPORT.

ARE THE CONDITIONS WE HAVE BEEN URGING, REALLY SO IMPORTANT, AFTER ALL?

**I** FINISHED looking over my bees last week, and am very well satisfied with the results. I have lost only two out of 150; and of the remainder, all but three are good strong swarms, many having four good frames of brood (Mar. 19). One of the swarms lost was sacrificed "in the interests of science." It was a very large swarm in the house apiary — the only one — and late in the fall left their combs and built new ones on a shelf just above their hive, right out in the open air as much as they could be when indoors. They certainly had plenty of ventilation, and I thought it a good chance to test the ventilation theory. Perhaps they would have died anyhow; but the immediate cause of their death was starvation, as they had not carried up enough honey, and it was impossible to feed them where they were, during the cold weather.

The rest were prepared for winter in a variety of ways. Fifty were in single-walled hives; 26 in chaff hives, and the rest in tenement chaff hives. Some were crowded down on seven combs by means of division-boards, and carefully packed in chaff, while some had the run of 24 L. frames, with no more protection than a chaff hive affords. Some were covered with porous coverings, though the most had enameled-cloth covers. Many had sticks or corn-cobs over the frames, as a substitute for Hill's device.

At the present time there does not seem to be any more difference in the results than was to be expected had all been prepared precisely alike. In some points, however, all were alike. All had plenty of bees and honey; all had winter-passages through or over the combs, with entrances full size, or some swarms having entrances at each end of the hive its full width ( $\frac{3}{8} \times 15$ ).

We have had a very severe winter here, the mercury frequently going down to 20° below zero, and remaining in the neighborhood of zero for weeks at a time. The fact that there was so little difference in the results seems to show that some of the conditions insisted on by many as essential to safe wintering are not at all important. If any difference appears before warm weather comes, I will report it. J. A. GREEN, 148.

Dayton, Ill., Mar. 26, 1883.

### HONEY VINEGAR.

HOW TO MAKE IT.

**I**N response to calls for making honey vinegar last month, we have received the following letters:

R. J. Fox, in April No., asks for a recipe for making honey vinegar. Vinegar can be made from any thing that has sweet enough in it to go through the fermenting process, as cider does in changing from sweet to sour. The sweeter you make the water, the stronger will be the vinegar, if not too sweet to ferment. No yeast is required. The more it is exposed to the air, the quicker the change. A cask with the head out is the best on that account, but must be kept covered to keep out insects. If a tight barrel is used, leave the bung-hole open, and draw out a few quarts once a day, and turn it back into the barrel, remembering that the more it is exposed to the air, the sooner the change. Never allow what is called "mother" to accumulate in the barrel, as it is a growth that lives on the strength of the vinegar. Every bee-keeper who uses the extractor should have a cask to wash the cappings, and work the sweet into vinegar.

L. C. WHITING.

East Saginaw, Mich., April 3, 1883.

I notice on page 192, April No., R. J. Fox wants a recipe for making honey vinegar. I have no recipe, but will tell how I have supplied my family with the very best vinegar. Four years ago I put one gallon of the best cider vinegar in a ten-gallon keg (that was during time I was extracting honey), and washed all the cappings and utensils that were used for honey, and strained into the keg, and have kept it filled up about as we used it out, since. I have not bought any vinegar for four years, and have had the very best and sharpest for use since. Keep the keg by the kitchen stove.

A. S. DAVISON.

Aullville, Lafayette Co., Mo., April 5, 1883.

R. J. Fox, in April No., asks for a recipe for making honey vinegar. Here is how I make it: I sweeten water by rinsing all articles that get any honey on them, including the comb and cappings, that I intend to render into wax, and I use all honey in this way that I consider unsalable, making the water as sweet as I would if using molasses (I can not tell exactly how much honey I use to a gallon, perhaps one gallon of honey to 4 of water). I make it quite sweet, and then add mother from other vinegar-barrels, which I always have on hand. When I rack off the vinegar to sell, I save the mother in the bottom of the barrel for this purpose; and the more I put in, the better — never less than a gallon of mother to a barrel of sweetened water. Set in a warm place.

By the way, my bees (131 swarms and 2 nuclei) are all in very fine condition, only two showing any uneasiness, and they with the nuclei set too near the end of my ingress air-pipe, and they got too cold, so that their breath condensed on the honey, which soured some of it, and gave them a little touch of the dysentery, but I have cured them. I shall not take them out of cellar until maple blooms.

Mauston, Wis., April 7, 1883. H. V. TRAIN.

Let in your pure air through a sub-earth pipe, friend T., and then it won't chill those near it.

### THE RESULTS OF ONE WOMAN'S BEE-KEEPING.

(Continued from last month.)

#### A SUBSTITUTE FOR GLOVES.

**T**HE best protection for the hands I have tried is thin cloth wrapped around several times. I use one of the thin cloth flour-sacks; cut a hole for the thumb, then wrap round and round, covering the hand and wrist entirely, so that only one-half of the fingers and thumb is exposed; then pin securely, and once between first and second finger; let the pin be on top of hand. As the cloth is white and clean, bees are not angered with it; and if they try to sting through, they can not; neither is it cumbersome to the hand, and keeps the bees from getting up the sleeves.

#### BEE-HATS, ETC.

For a bee-hat I use for myself and girls a five-cent boy's hat, with green wire screen sewed in front, with calico curtain sewed around back and sides, and below wire cloth. I like the cloth for sides, first, because the sun in the morning and evening, shining in through the side, prevents my seeing without difficulty, sometimes; and secondly, one does not get so taunted up. For "company" hats I make the curtain long enough to come down below the waist, so as to protect the hands, then make several plaits or folds, in the back and sides, at bottom of curtain, so as to give room for arms and shoulders.

#### A NOVEL WAY OF MAKING ARTIFICIAL SWARMS.

Out of all three of our honey-ouses, at the close of the bee work, we had to take a swarm. We knew that it seemed impossible to get the bees all out of our Timber Honey-house; but not until large sheets of nice white comb began to appear did we suspect a queen; and, indeed, I had not noticed the large cluster up in the cone of the building until it was very large, although our hand said he had. So we, Charley and I, set a hive, without bottom-board, on

top of the house; fastened it there by a board, one end of which was against the hive, and the other end nailed to a post at side of house, then Charley bored two auger-holes down into the cluster below; then standing on a barrel inside, I smoked them up into the hive that had combs to receive them; cut down the combs, and saved them also. But Mr. A. had to finish the rest, which was a little more than Swede Charley and I could do, to take an enormous swarm in a bottomless hive off the top of a house.

Our honey and storage houses at home were almost solid full of honey, and we had to wait until honey was removed before we attempted the swarms in them; but by the time we got to it they had nice sheets of new comb built between the shelves, and had lengthened out the cells of honey, injuring the looks of a few sections (not many); but the way we got them out was by brushing the clusters into a pan of warm water, and skimming them out into a nucleus sitting near the door that had received bees before, and was queenless. The bees that stuck to the sections, we carried to the door and brushed off. We soon had all out, and not very many died from being wet. The queen was all right, and it is now one of our best colonies.

The honey the bees had put into the new combs built was the nicest I ever ate, so thick and waxy; the bees had not injured the sections by uncapping, but had taken out the unsealed honey; but as they found plenty of that, no harm was done. The queen was probably taken in the last-named house when we took off the racks for winter, and also the one in the storage-house, and then all the bees that came in united with her. Although we brushed out multitudes of bees, yet each day we brought in more until they were contented to stay there, and would not cluster on the screen door. At the close of the honey harvest we could not leave the wooden door open very long, as the bees outside smelled and saw the honey inside.

#### REMOVING THE BEES FROM THE CELLAR.

We think it pays best in our locality to keep bees in the cellar as long as we can keep them quiet in the spring, and have discarded feeding for pollen. Last spring we kept them in a few days too long, as one Saturday night they seemed very warm and uneasy, although doors and windows were open. The sun rose warm and bright, but we dared not close the doors, as they were buzzing loudly; still, we threw several pails of water around in the cellar, then got large blocks of ice and placed all around, which cooled them off somewhat by morning, so that they could be carried out. Mr. A. and hand were up by 3 o'clock, carrying out hives. Our bees seem not to mind sitting on a new stand; but we set them where we want them. A man from Iowa said that when he set out his 40 colonies in the spring, they all flew out and became one huge swarm, but settled. He put his hand in the cluster and saved 19 queens, I think, and the rest of the bees he put with them.

#### HOW TO DISPOSE OF BROKEN HONEY.

I am sorry to have written such a long letter, and am afraid you won't know how to take time to read it. A word more, and I will close. As soon as we could get time, Mr. Axtell and a hand took pans of cut-out honey, some rough and unsealed, but good honey, one afternoon, and went down to the coal bank, sold what he had for his two loads of coal, and engaged enough more to the amount of \$20.00 worth, 15 and 16 cts. per lb. for the honey, and next day two

other men sent word that they each wanted to sell a load of coal for honey. Our home market has greatly increased since we began keeping bees; nearly every family wants honey. We had an order for a carload, or all we had, at 14 cts. per lb. on board cars at Roseville, but we had already disposed of the bulk of it. It used to be a great study how to get rid of our honey; but now that trouble has nearly vanished, and a market is also growing for our extracted honey. Swedish people seldom use other than crushed and strained honey in Sweden.

#### DRONE COMES FOR EXTRACTING.

If you are not too tired of reading this long letter, I should like to tell you how we manage the drone-combs in our extracting-hives. We have about 20 ten-comb hives which we use for extracting. We put on top 3 drone-combs, and on each side and the center fill up with worker-combs. The queens will nearly always go above, and fill the 4 worker-combs. When I want brood in a hurry, that is just the place to get it. Smoke all the bees down, and the queen will stay below long enough to fill up, and then ascend and fill the combs above; no swarming in those hives, and I can have brood all summer, and nearly always in the fall. They are not so apt to lay in them when driven down and let fill up for extracting or spring feeding.

#### WAX-EXTRACTING.

My work to-day has been trying out beeswax by the old process. I have been wishing I had one of the very best wax-extractors that could be made. I have always thought that I could get more and nicer wax than with an extractor, judging from the color of fdu. as compared with what I make by melting in my wash-boiler; but I nearly spoiled my new cloth shoes with wax, as the water struck a boil before I got them changed. I think it injures wax to boil; as soon as it strikes a boil I dip it out into a strainer made of a coarse towel cloth. I get the nicest of wax from the scrapings of sections, scrapings from top of brood-frames, etc., before the racks are put on in the spring. The wax rises to the top, but propolis goes to the bottom of the boiler.

#### THE PLASTER PLATES.

We use pressing-plates made by a man in Iowa — I forget his name. Mr. Axtell attached them to a press of his own make, so the work is done rapidly, and very thin and even foundation is made; thinner than any sample sent us by manufacturers.

#### ENTRANCES CLOGGED WITH ICE.

To-day Mr. A. went over to his Timber Apiary to see if things were all right; found two hives clogged with ice, probably caused by melted frost inside. We have a boy over there, engaged to keep the snow from the entrances. Since the winter that we lost 80 colonies we have been careful to remove the snow before it gets melted near the entrance, which I believe should always be kept open.

We have just weighed our beeswax, and find we have just 102 lbs., all nice bright yellow wax, and about 25 gallons of vinegar, the washings from cappings, etc., of the 4½ barrels of extracted honey. We fed the bees more scraps, and the honey in cappings, etc., than ever a season before, for we had so much honey it seemed impossible to keep it away from them, so they got used to their daily feed, and they were not cross either. When cool weather began we had to scrape sections and pack in the house; some days we had a small swarm in the house, but they seldom stung us.

Our honey-houses were not large enough to hold all our honey. We had to put most of the large brood-combs up stairs, about 2000 lbs. in all, for next spring's feeding. Through haste and carelessness we got it to leaking — so much so it leaked through the plaster into the parlor bedroom. It was a task to remove the honey, and then we had no other place where we could well keep it from the bees (we had honey in every common room in the house), so we opened up the windows and let the bees help themselves, and they did help themselves. The most bees I ever saw in one body were in there, and the loss was but few. They cleaned up the floors nicely, and took out the unsealed cells before uncapping a great deal; but they hung around those upper windows every day they could fly afterward.

And now as I have finished my jubilee number (50 pages) I will close, bidding you good-by, and will not come again for a while. SARAH J. W. AXTELL.

Roseville, Ill., Jan., 1883.

I am very much interested, my good friend, in your account of the clustering of bees in your honey-houses. If I get the right understanding of the matter, you have demonstrated that bees will live and build comb in confinement, even during the warm weather; for, if I mistake not, these bees did not fly outdoors at all, or did they get through the openings in the roof? It seems to me this could not be; because if they did, robbers would come in through these openings. I am very anxious indeed to know if there was brood in these combs. You say they had a queen, and you say they brought honey from the unsealed sections. From this remark I inferred that they worked simply from sections up to the cluster, not getting out of doors at all. Now, if they raised brood, where did they get the pollen? or did they carry the pollen also from the combs? — The pressing-plates you mention were, we suppose, made by our friend Oliver Foster, Mt. Vernon, Iowa. I am glad to know you succeeded so well with them. You say Mr. A. made the press; do you press sheets, or are we to understand you simply pour melted wax on the plates?

Had your hives been properly ventilated from above, it hardly seems to me that the clogging of the entrances with ice could have hurt the bees. Our chaff hives are so made that the entrances may be sealed up hermetically, without any danger to the bees from want of ventilation.

No doubt you did have honey without stint, and it seems to me a kind Providence has thrown it into careful hands. And we highly commend the way in which you took so much pains to save and dispose of all the odds and ends. Most of us with such a quantity of broken honey as you mention would have felt the task almost a hopeless one of disposing of so much. I hardly think I should want to recommend your plan of cleaning honey off from the floors and the parlor bedroom. I dare say you had bees there. The reason you got along with them so peacefully was, I presume, because the bees had so large a quantity to work on, or every bee was gorged with honey, and there was but little inducement to quarrel. In fact, they were much in the same condition as when gathering natural stores from a boun-

tiful basswood flow. May God's blessing continue to be with you and your bees, and those you employ. I feel especially like adding emphasis to this latter matter. When blessings like these are showered down upon us, let us accept them and use them as a means of doing good, and helping those by us who need help; and in no way in the world can you help so effectively as to give employment to those who need it. Your 50 pages were none too long, my friend; and indeed we should be glad of 50 more, could you combine so much valuable instruction as you have in this article. We hope you will "come again" soon.

### HOW HE DID IT.

MR. HOUSE TELLS FRIEND DICKERSON HOW HE GOT 3000 LBS. OF HONEY FROM 14 COLONIES, ETC.

**M**R. ROOT:—I have just read in April GLEANINGS the article on page 166, and am glad to hear you have employed one who is able to answer the many questions coming from all quarters. You will confer a great favor if you will get Mr. House to answer one or a dozen questions for me, as the case may be. The question is, How did Mr. House manage his bees to get 3000 lbs. of honey from 12 or 14 swarms, and more than one new swarm from each of the old? Did he tier up for surplus? If so, how high? Did he use fdn. for surplus? If so, were they full sheets or starters? In other words, please give his management, and make it so plain that a 14-year-old boy may understand him. I am 46 years old, but a mere boy so far as a knowledge of apiculture is concerned. If you can not fix it ready for your May issue, please write direct to me on receipt of this; for if tiering up is the order of the day, I want to change my hives, as they are but 1½ story high.

WILLET DICKERSON.

Ladoga, Ind., April 11, 1883.

#### MR. HOUSE'S REPLY.

Now really, Mr. Dickerson, you are trying to get from me something that may be hard to tell; for since the world began it has been easier by far to tell or to boast of what *has* been done than to tell just *how* 'twas done; while to tell how the same thing may be repeated would be harder still. But Mr. Root told us the other day in our noon service that we were expected to do nothing more than the best we could, so I venture.

Two years ago at Saugatuck, Mich., I lost about 50 swarms, having but four weak stocks in the spring. During the season these increased to 14 swarms; and besides furnishing enough honey for a year's supply in a large family there was thirty dollars' worth of comb honey sold. But much help was derived by the use of old combs. These 14 swarms all lived through the winter of 1881-'82; but two of them were very weak, as per page 166, April GLEANINGS. These two weak colonies were set to queen-rearing for my own use; and in raising queens I have always paid much more attention to the honey-record and non-swarming propensities of the progenitors than to their record of purity, though I had a few very fine pure queens. For the 12 strong swarms I began early, and followed a system something like that which friend Doolittle described a few years ago—keeping the bees confined by a division-board to just such space as they would fill, and added more room by placing empty combs in center of brood-nest.

As my queens came on I made enough nuclei to keep them, so as never to be in want of a queen when one was needed. My method of controlling swarms was a rather picked-up affair. The first and only object was to keep every honey-swarm just as strong as possible; hence I got them to working in surplus just as early as there was any chance; and when it seemed as though they could not contain themselves longer without swarming, a frame of brood was exchanged for empty comb or fdn., these frames of brood being placed in a weaker honey-swarm, if there was any such place; if not, they were put in some of the nuclei. I did not try so hard as I sometimes have, to prevent natural swarming; but rather than risk any slacking of their efforts on comb honey let them swarm, and here was a point I quite delighted in: it was to have a new swarm that came out in the forenoon be faithfully at work in upper story in the afternoon. The method was to let them have, not only the satisfaction of issuing as a new swarm, but of going into a new hive and occupying a new site. But remember this: that all but two or three of the frames of brood went from the old hive into the new one with them; generally leaving about two of the finest frames of hatching brood on the old stand for a nucleus, taking all the bees I could from old stock for the new. The result was, they not only had the fun of swarming, but they were such a *big* swarm they had to go into surplus. I believe that most of these swarms sent out another swarm in course of the season; but all were treated alike, and the increase was made entirely by the gradual growth of the nuclei; and when there was any surplus to be had, *there was not a swarm*, except among the nuclei, that had any excuse for *not* putting it up in good shape.

Now as to surplus: I did not use two tiers of sections, as is now becoming so common, but I used a case more like the one pictured on p. 20 of Mr. Root's price list. I don't know why I might not have used the usual method of two tiers with as much success, but I never have, and perhaps never shall. Neither did I, in any single instance, "tier up." The fact is, I did not see the time when it seemed as though I could, with profit. As fast as any thing was ready to come off I put it up in crates ready for home market or shipping. But let me say, that I think if I had been badly crowded I might have tiered up with profit.

#### STARTING BEES IN SECTIONS.

Perhaps I did have one point on starters. I took whole sheets of fdn. and tacked them between two thin strips as long as top-bar of frames; and during a free flow of honey would open my nuclei and drop from one to three of them into their hives, and as I kept every nucleus as strong in proportion as the honey-swarms, they could and *did* work on these sheets of fdn. most delightfully; and one of the greatest pleasures I had was to go through the apiary in the morning, and take out these sheets that were then beautiful white combs, clean and new, and drop other sheets of fdn. in their places. It was really marvelous to see how these little swarms would work out those sheets, and I was as delighted over the idea of having them help me in the way they did, as Robinson Crusoe was over some of his new plans and discoveries.

I very much prefer tacking the sheets of fdn. between two thin strips just as long as top-bar of frame, in preference to putting them in frames, be-

cause I could do it so much faster; and as these strips were lightly nailed with short brads they would come apart very easily, and leave the *fdn.* in good shape, with no waste. Of course, this top edge would not be worked out, but I placed the starters so that this edge would be at the bottom of the section. Then with these strips I could draw the frames nearer to the *fdn.* when it seemed best to economize room and save the heat of a nucleus.

These sheets of new comb I cut just as large as I could manage and get it in the section, always cutting them square, so that by dipping two sides in hot wax and rosin I could make them stick in a corner, and hardly ever had one fall. Now, if there is any thing that will induce bees to work in surplus boxes it is *new* comb; and I have never before been able to get more than a few pieces of fresh comb to use, and that was generally drone, and often contained eggs. But this was perfect; and I had an idea, too, that the "fishbone" was worked down thinner than it would have been in sections. The *fdn.* I used was made for use in brood-chamber; but a much thinner grade is now being made for starters in sections. I tried to have no more surplus room on a hive than was fully occupied, and often changed the positions of boxes from outside to the center, where bees were working strongest.

My honey season was a *poor* one. There was but a very light flow of clover, and I never have any basswood. There was *only* about two weeks of good honey-yield, and that was during goldenrod. But I do think, Mr. Dickerson, that there was a secret underlying it all that helped more than any other one thing to give me the 3000 lbs., nearly all of which was comb honey, and the 18 new swarms; and that was, that the pasture was not overstocked, there being scarcely another swarm to interfere with them. I think I am correct in this; for frequently with fifty swarms, in good honey seasons, where there were many other bees in the neighborhood, I have been unable to obtain more honey than I did from these twelve.

Now I think I have mentioned the principal items that led to any degree of success, unless it is that I have omitted to speak of the use of the extractor in the brood-chamber, a matter that should never be neglected. Whether I have made it plain enough for a 14-year-old boy, I don't know, though I guess that you can understand it. But do not fall into the error of thinking you can definitely follow the plan of some one else entirely. I believe every successful honey-raiser has a great deal of *individuality* in his method, and is obliged to have, for their circumstances are so various. Almost every action in an apiary is an *emergency*, and one must be prepared for them as a surgeon would be for "surgical emergencies."

One finds a great deal of individuality among beekeepers that is quite astonishing in such a position as Mr. Root has given me. It's really amusing. Before me now lies a letter from Missouri from a man who wants all his frames and 500 sections *made up* and shipped to him, and wants a tin separator, bent down at each end for *each individual section*. He was written to last week, and advised of what an enormous freight bill he would have to pay, and how impractical it was to have such separators. But he says he'll risk the freight; and as to the separators he knows what he wants. But this is only one of a dozen such that come up every day. Some are

willing to listen to advice; but most of them bow before the shrine of their pet idea. Josh Billings never came nearer the truth than when he said, "Eggs-periens iz a gud skule, but the tooishun is veri hi."

Your friend,— WALTER B. HOUSE.

Medina, O., April 17, 1883.

There are two points in the above I would strongly commend: First, letting the bees swarm, then moving the main part of the brood to the new colony for getting box honey. Secondly, filling the sections with large starters or freshly made comb partly worked out.

## WINTERING BEES.

THE WHOLE OF IT IN A NUT-SHELL.

**W**ELL, well! what's the use running after new ideas and improved methods in wintering if they only lead in a circle? Just stand still, and you will be right part of the time at least. Only hear the confused advocacy of clamps, 'baff hives, a dry cellar, a root house, a bank vault, b. y them in the ground in the snow, in a strawstack, upward ventilation, downward ventilation, no ventilation, no bottom-board, no honey-board, no cover, no enamel cloth, no pollen, no honey, pure sugar, no noise, no light, no dampness, plenty of water, running water, snow shoveled in to produce dampness, sawdust, absorbing material, old duds, corn-cobs, wooden spiders, division-boards, mattresses, quilts, cushions, counterpanes, pillows, etc., *ad infinitum*.

Well, what is the result? Why, the blessed bees wax fat and thrive, and the "blasted" bees languish and die under almost every kind of treatment.

ENAMELED CLOTH AND WATER IN WINTER.

What treatment do I advocate, did you say? Oh! that's not the point; I was trying to express my surprise to find that my shi tless and blundering method has been hit upon and almost commended by one of our highest authorities — Mr. Doolittle. I refer to the water collected b the enameled cloth (page 172).

I have only thirty swarm. I put 28 of them in the cellar just as they were in the open air — covers, enameled cloth, and all, face to the wall, all in one tier, four hives high and seven long. The bee-cellar is partitioned off by itself; is entirely dark, and has a chimney used for ventilation whenever I judge it to be necessary. Every hive came out in good order, yet dripping with water when moved from a level position. Another time I would give them a little slant, to facilitate drainage.

JOEL A. BARBER.

Lancaster, Wis., April 6, 1883.

Friend B., my wife said jestingly, a few days ago, that it didn't trouble her nearly so much when people told things that were not true as it did when they told things about her that *were* true. Perhaps this philosophy will account for a tendency of mine to feel a little irritated at your numeration of our wintering troubles and devices. It is laughable, anyhow; and if it is not *all* true, there is at least a pretty big grain of truth in it. I am glad to find out that you know how to winter your bees. Now just keep right on doing it, year after year, and pretty soon we shall *all* know how, won't we?

**WIRING FRAMES FOR FDN.**

ANOTHER STEP IN THE MATTER.

I SUPPOSE that you are crowded almost to death with business and bees-ness. But listen one moment, and then chatter away before that short-hand fellow—or, rather, lady. In wiring my frames I have no holes to make nor wire to trifle or bother with; and the frames when full look just as though they were nailed into the frames.

I think they work "boss." Fasten a piece of  $\frac{3}{8}$  board to the side of the work-bench, about 4 inches wide, and the length of the frame on the inside. Now make holes at every interval where you want a wire. Hang the frame on this block, and drive  $\frac{3}{8}$  wire nails into the frame over the holes. Turn over, and hang the other side on and treat in the same manner. When the nails are all driven in, take a pair of round-nose pliers and turn the point down in the form of a loop, or staple, and they will never pull out. You need nothing to hold the wire when starting, but thread it through the middle one at the bottom and give it a turn or two around, making a kind of twist; then go on around the frame.

I think it will be all plain to you; but for fear that it won't, I will send a piece with two places fixed. I use  $\frac{3}{8}$  nails, but think  $\frac{1}{2}$  will be as good, and perhaps better. It takes, I think, a little longer to make them, but they are so much nicer it more than pays for the trouble.

BOTTOM-BAR, WITH WIRE-NAIL STAPLES IN IT.

If you like this plan, use it and welcome: but if not, you don't "have to." You can make the loop go across the grain, if you choose, but I turn them this way because it is so much handier, and they work just as well.

Bees are not wintering very well in this part.

Galesville, Wis., March 22, 1883. G. E. DUTTON.

Thank you, friend D.; and although it seems to me some one else has suggested the same, or something similar, you have improved on the manner in putting in the nails and bending them, until I shouldn't wonder if it would be really cheaper for the majority of the friends, than drilling holes and weaving the wire through. The thin nail-heads on the wire nails can be easily sunken in level with the wood of the top-bar, and will not be in the way through any scraping of the top-bars; nor will they give the top of the frames an untidy look, as the wiring often does. If the wire could be put in more easily with the hooks turned at right angles, they could be easily twisted a quarter-turn after the frame is wired. And this suggests another idea that I am going to claim as my own invention: Should the wires be a little too loose, just twist the staples around until they have their requisite tension. There, now, boys, isn't this "brilliant"? Our 25-ct. round-nose pliers are just the tool for bending the points of wire nails into a hook. To do this rapidly, we want the wire nails made rather slender. Those we sell are made expressly to our order of a smaller-sized wire than those made first. In regard to your board for spacing the nails, I would suggest that the wood be cut out on the side next

the operator, so that, in turning them, they can see the points as they come through. Friend D., I rather think we owe you a vote of thanks—quite a number of us.

**HALF-POUND SECTIONS OF COMB HONEY.**

ANOTHER SCHEME SUGGESTED.

I THINK the best way to supply the demand for  $\frac{1}{2}$ -lb. sections would be to have the honey made in large frames, and then have it cut with a cutter into pieces about  $2\frac{1}{2}$  inches square (which,  $1\frac{1}{2}$  inches thick, would be about  $\frac{1}{2}$  lb.), and the pieces placed in square tin boxes just a little larger, so that they would slip in easily; then pack these in a large box, with a thick paper between the layers (or paste-board), and when the case is full, press down the cover and fasten tight. The cases should then be kept right side up; but I do not think they would leak if they got turned wrong side up.

Perhaps the boxes could have covers, and be sealed as you seal the extracted honey in small pails. They would be nice for picnics or fairs, as they could be eaten right out of the box (I guess we should want  $\frac{1}{4}$ -lb. boxes for such places);  $\frac{1}{2}$ -lb. boxes ought to be furnished for 2 cents each in large quantities, and perhaps less. I intend to try them the coming season, if I can get the boxes made.

H. S. KINGSBURY.

Cavendish, Vt., March 23, 1883.

Friend K., I should not be surprised if your idea bore fruit, after all! Why not use our glass jelly-tumblers, and fill around the piece of comb with liquid honey, and then none will be lost by the drip and leakage. We can make you round tin boxes for two cents, easily enough.

**WILLOW AS A HONEY-PLANT.**

A HONEY-BEARING HEDGE.

BY this mail I send you a few cuttings from a willow that grows in a neighbor's yard, across the street from me. It sprouted up from the root of a Scotch drooping-willow that died above the roots. It is now three years old. I measured it this morning, and found it to be 18 feet high. The top is pyramidal, with long slender branches, making a most beautiful shade-tree. It blooms the first of April here, and is one of the best bloomers that I know any thing about. The catkins are very large, and yield yellow pollen, and honey in great quantities. When in full bloom it presents a very beautiful appearance. Bees work on it all day long, gathering a bright yellow pollen from it. It will grow readily in any soil, I think. I put out a few cuttings last spring along the fence, sticking them into the hard ground, and every one grew, some of them making a growth of 5 feet, and all are full of bloom this spring. Those cuttings I send you will bloom in a few days, if you stick them into the ground. It is very easily propagated by putting the cuttings into loose moist soil. It does not throw up runners or sprouts. I think it will make a valuable spring bloomer, and a pretty shade-tree. What variety of the willow is it? I think that bee-keepers would enhance their interests very much by planting such shade-trees as bloom in the spring.

There are different trees that bloom early when

our bees need pollen and honey, that make beautiful shades. Among the best, I think, is the box-elder. Here it blooms just after the soft-maple and elm. It is hardier than any other shade-tree we have, is not liable to be preyed on by insects, nor burnt and blistered by the hot sun in summer, as so many of our shades are. It is true, the bloom does not last long; but it yields a large quantity of bee feed while it does last. It serves the double purpose of a shade-tree, and furnishes bee food. Bee-keepers in all of our towns and villages might, with judicious effort, line the streets and avenues with these honey-producing trees that would be of great assistance in building up their stock in the early part of the year, and aid in beautifying their homes.

WILLIAM LITTLE.

Marissa, St. Clair Co., Ill., March 13, 1883.

The willow you mention, friend L., has been spoken of several times before in our back volumes. I don't now recall the name of it, but it is the one generally used by nurserymen as stock for budding on to the kilmorark, or weeping-willow. This plant is thoroughly disseminated over the country, where these ornamental tops die, and leave the natural root to sprout up. I think they have been sold especially for honey-plants. We have one in our grounds in bloom now, this 16th day of April. We have put out the cuttings, and will test them to see if they are the same as those we have already. We have never seen the box-elder in bloom. Can this willow be used for a hedge? Who will tell us?

## “Forgettery.”

Or Department for those who don't Sign  
Their Names, etc.

THE following illustrates how a supply dealer may be innocent, when circumstances seem very decidedly against him:—

Inclosed you will find one dollar, for which you will please send me a copy of your A B C; or if you have any thing later that you think will suit a man who doesn't know any thing about bees, please send that. I think A B C will suit me. Also send me a late copy of GLEANINGS. Please send as soon as you can, and you will very much oblige me.

Asbury, Mar. 14, 1883.

J. M. ANDREWS.

In the above letter you will notice that no State is given. As the Postal Guide gives nine “Asburys” in the United States, we had either to write a postal card to every one of so many different States, or wait until our friend wrote again. It seems he waited two weeks before he wrote again, and here is his card:—

Some time ago I sent you an order for your A B C book. I sent registered letter; received return card, but have not heard from the book yet. Will you be so kind as to send it as soon as possible, for I should like to have it?

J. M. ANDREWS.

Asbury, Warren Co., N. J., Mar. 29, 1883.

You will notice that he seems to have positive proof that we received his money, and also that we knew his address. He is right in saying that he did get a return card, but

this return card is simply a card furnished by the P. O. department, acknowledging the receipt of the registered letter. The clerk who goes to the postoffice, and signs these register cards, of course does not know whether all the addresses are inside of the letters or not; so that, when the letter came to be opened, we had no possible clew as to where our friend lived, who wanted the A B C book.

## FRIEND TRAIN'S IMPROVED BEES.

THE COMING BEE.

I COMMENCED bee-keeping in the spring of 1864. I bought, in February, 1864, 2 swarms of large brown bees, called at the time the “Kickapoo” bees. They had descended directly from wild bees found in the Kickapoo woods. I kept them in the old way with varying success, making a great many experiments in management, winter and summer. I bought and tried a great many patent hives, but did the best in hives of my own devising, until the winter of 1878, when I consulted you, and took your paper and read your A B C as fast as published. However, I had used two styles of frame hives before that, both patent, and neither as good as a large double box hive devised by myself, which was a moderate-sized family room, surrounded by a hollow wall of dead air, and a large chamber above for using surplus boxes. I had never aimed to increase to more than 25 or 30 swarms to winter, killing all that I did not want to keep and couldn't sell. I always worked on the plan of the survival of the fittest until 1876 or 1877. I then let them increase to nearly a hundred swarms, when I began to make some more inquiry and study, looking to more profits; and since 1878 it has taken nearly all my time and attention; and it is more and more interesting, and it has been fairly profitable.

I have not experimented much in the different races of bees, but I have been an interested spectator of the experiments of others. I read all that is said, pro or con, in GLEANINGS and A. B. J., and in many books, among which A B C is about A No. 1, though Quinby, by Root, and Cook's Manual have been not read only, but carefully studied; and I have carefully noted the work and habits of the races in different apiaries, and I am now determined to stick to and develop a cross between the yellow and brown bees in the manner proposed. And as I am a small man of small means, I am not going to try to do every thing I can hear or think of; but this one thing I mean to do, if I live long enough. And now let every man follow out his own ideas with his own plans, and we shall see what the “coming bee” will be.

So far, I find this cross (all would say hybrid, but a cross between two races of bees can not properly be called a hybrid) to be active, hardy, and very, very energetic in finding honey, if there is any within their reach. And they do fly from 6 to 8 miles every year that basswood yields honey, and bring me a large surplus, from 500 to 2000 lbs., and the young swarms that issue at or about the commencement of basswood bloom always fill their brood-chamber with basswood honey; and they work on red clover just as freely as on white or alsike; and they are as docile as I care to have them. I can do any thing with them that I can do with full-blood Italians, and

with no more smoke. They have one trait that I value highly, and which some, if not most, Italians lack. While they will stay on the combs in handling well enough for all my purposes, they will drive before smoke very readily, and will not hang to and mar the honey when you are trying to drive them off; and I believe I can take nearly twice as much comb honey from them in a given time as I could from full-blood Italians; and this is no small item with me, especially in such a year as 1881, when I took over 11,000 lbs. of comb and 3000 lbs. extracted from 125, spring count.

H. V. TRAIN.

Mauston, Wis., Dec. 8, 1882.

### VARIOUS ITEMS FROM FRIEND DOOLITTLE.

"BEES WON'T STING SOME PEOPLE."

I WAS much interested and amused in reading R. C. Taylor's account on page 179 of the man who thought he could handle bees without getting stung. Many similar cases had come under my notice, all of which resulted as friend Taylor's did; i. e., the persons claiming bees never stung them were soon put to flight, receiving more or less stings, till one day an elderly man came to the bee-yard. I cautioned him not to come too near (as my custom is), but he did not heed it, saying, as he came close up to the hive I had open, "Bees never sting me." As this was in May, the bees were not so inclined to sting as they are later in the season; and although I wore a veil, still few bees offered to sting, so of course he was not stung. Later in the season, after the honey-flow had ceased, as myself and a friend of mine were taking off nearly the last section honey, this same man came walking into the apiary. The friend was about to caution him about coming too near, as the bees were quite cross, when I told him in a whisper that the bees never stung that man, so there was no need of caution. As he came where we were I laid aside the smoker; and when handling the cases of sections I managed to jar the hive and crush some of the bees, which were cross hybrids. The air was soon filled with angry bees which were flying in rage about the heads of my friend and myself, stinging through pants and shirt, and even crawling into our pants pockets, and stinging there. *Very much* to my surprise, not a bee flew angrily about this man; and to test the matter still further I asked him to take some of the side cases out of the hive, so as to help me while I held others. He did as I requested, while I carelessly let a case of partly filled sections drop upon the top-bars of the frames which were covered with bees, killing a dozen or two. This brought a cloud of bees at the heads of my friend and myself, like so many hailstones, while the air was fairly perfumed with poison from the enraged bees; still not one offered to touch this man. I closed the hive; and as we walked toward the house, my flesh fairly crawled at the hissing of the bees on my hat and clothing, with now and then a sting penetrating through; still this man was not stung, nor did I see a single bee offer to sting him. Afterward he told me he had kept bees for years, and never was stung by a honey-bee in his life. I told him I would give considerable money if I could have the same freedom from stings he enjoyed. Has any one met with a similar case, and how can it be accounted for?

### ENAMELED CLOTH, ONCE MORE.

Upon setting about a third of my bees out of the cellar I find that those which were full swarms having enameled cloth over the frames have wintered well, while the weaker ones (I had a few nuclei last fall I put in cellar by way of experiment) with said cloths over them are in poor shape. The bees are nearly all dead, and the combs are dripping with moisture. The honey had soured, and the bottoms of the combs are quite moldy. The nuclei having quilts over them are in much the best shape, while the strong swarms with quilts are not nearly as good as those with the enameled cloth. This would seem to show that the strong swarm maintained warmth enough to drive the excess of moisture out at the entrance of the hive, except enough to supply their need of water; while the weak ones, not having that warmth, allowed the moisture to condense on the cloth in such quantities that it ruined them. On the other hand, the dry warm quilt benefited the weak, while it retained no moisture for the strong swarm to slake their thirst.

### SETTING BEES FROM THE CELLAR.

I find that most parties wintering bees in the cellar are in the habit of setting all out on one day. When this is done the bees will mix, more or less, if no precaution is taken to set them on the stand they occupied the season previous, so some stocks will have more than their proportion of bees, and others be weak. Of late years I have adopted this plan, and find I can set out the bees with no mixing, without setting any on their old stands, it making no difference where they are placed. On warm days, at about the time the first pollen appears, I commence about 4 o'clock P. M., and set out, say 10 swarms, scattering them over the bee-yard as far apart as possible, which prevents their mixing. By this time of day the bees which have been out previously, have ceased to fly pretty much, so there is no danger of their robbing those just set out, which is often the case where bees are set out in the middle of a warm day; as those newly out are so anxious to fly they pay little or no attention to robbers. If the next morning is fine, ten more are set out before the others commence to fly, so they have their flight and get prepared for robbers by the time those out before get on the wing. These last ten are scattered over the apiary as the first was, so as to be as far from each other as possible, paying no attention to how close they come to those already out. Thus I set out morning and evening every pleasant day, till all are out. Having set out ten this afternoon, caused me to speak of it, as this way pleases me so much better than the old one did. First pollen today.

G. M. DOOLITTLE.

Borodino, N. Y., April 14, 1883.

I too, friend D., have heard people say bees would not sting them, and I have heard many more say that bees stung them at every opportunity, and that they would even go several rods from their hive on purpose to sting them if they came anywhere near. Now, my position in all this as you know, perhaps, has been that bees are no respecters of persons; that it is the behavior of the individual and not the individual himself. In all my experience I have never had any *good* reason to think otherwise. The case you give is a little surprise to me; and if I were you I would not drop the matter there. Get this man to work again, and work among

the bees day after day; and if it really turns out that he never gets stung, he will be a novelty, to the bee-keeping world at least. Even though the facts you present seem positive and conclusive, yet I can not help thinking it was somewhat accidental. I have often been among enraged bees when, although they were stinging others right and left, they seemed to pass me by; but I have always thought it was more the way I behaved than any thing else. Another point occurs to me here: While others are complaining bitterly, and being bitten by mosquitoes, I never get bit at all. This has been verified dozens of times. I always explain it to my friends in a joking way, by telling them that the mosquitoes don't consider me "good to eat." I agree with you, that if I could be insured to be free from bee-stings without veil or smoke, I would give quite a little sum of money to be taught how. Can any of the brethren give any further facts in regard to the matter? By the way, friend D., were you not a little wicked when you killed the bees and bumped the sections in order to get our friend stung?

In regard to the enameled sheets: Other reports agree with what you mention, that powerful colonies seem to do better for having the thin impervious coverings over them; while with weak ones it seems to keep them too damp. Very likely this will account for many different experiences having been reported from enameled sheets for winter covering.

I am inclined to think your suggestions in regard to setting out bees are very valuable. I am the more interested in it because we have determined to winter at least a part of our bees next winter in the nice cellar underneath our new brick house I have been telling you about. One of the principal objections I have about cellar wintering is the difficulty in getting the bees out and getting them started to fly all right. The more experience I have with spring dwindling, the stronger I approve of your idea, that bees should remain in their winter repositories until the first pollen begins to come. If I raised only comb honey, and didn't rear queens for the market, perhaps I would still stick to the chaff hives. In fact, reports seem to be so very favorable with chaff hives, even during the past severe winter, I should hardly think of using the cellar instead of them, were it not for the fact of our rearing queens for sale as above mentioned.

### ◆◆◆◆◆ THAT HONEY-HOUSE, AGAIN.

ALSO SOMETHING ABOUT MARKETING HONEY.

I HAVE been rather anxiously watching to see some plan for a honey-house something like the one Mr. Flanagan, of Belleville, Ill. spoke of in last Dec. GLEANINGS. I want to build one this spring with shop under the same roof, in which to make hives and put sections together; in fact, every kind of work pertaining to an apiary — one suitable for storing, extracting, and preparing for market the honey from 75 to 100 colonies of bees. I should like one not too expensive. I think a house so constructed as to allow a good cellar under it for wintering, in case a person wished, would be a good

idea. It is certainly not best to put bees in a cellar under a living-room, or one used for storing vegetables.

In writing to the bee-papers it would add to the value of the reports if correspondents were to give the prices they were selling their honey for. It would enable us to get something like uniformity. I had quite an experience the past season in that respect, owing to our large yield of honey. I was forced to seek a market outside of the towns in which I had usually sold my crop. In doing so I went to a city some 35 miles off, containing about 40,000 inhabitants. There I of course met with more competition than I had been used to, but I succeeded in selling with but little trouble. Considering that I was a stranger, my honey did more to recommend itself than any thing I could say. I learned something of the way other producers placed their crop on the market. Among other things I was led to think that some of them sold at a much less price than they could have received, simply because they had large amounts of it, and were not posted in general in regard to its worth. Such persons are the means of injuring the market greatly for the product of those who are fully posted, and have taken pains to put their honey on the market in good shape and popular-sized packages. Another thing I observed was, that the 4½x4½ sections holding 1 lb. were more in demand than any other size. Box-hive men do a great deal toward depressing prices. Thanks to the improved system of bee-keeping, their numbers are growing "beautifully less." I also found quite a prejudice existing against extracted honey. I took only a small quantity with me, for fear I should not close it out readily. I had it well ripened in Mason quart fruit-jars, with some of those nice blue and bronze labels purchased of you. The first grocer I showed a sample to bought the whole lot "without a word." I have found the above package to be the most popular for extracted of any thing I have tried so far. My comb honey was in sections holding 1¼ lbs., 4½x5. I received \$6.00 per dozen for the extracted, and 17 cts. per lb. for the comb.

I do not wish to be understood as dictating; but with the rapidly increasing interest in bee-keeping I should like to see GLEANINGS semi-monthly, allowing the matter in JUVENILE to be put in the regular issues of GLEANINGS.

Why can't our bee-men who are writing and revising "bee books" insert some good plans for a building suitable for honey and the apiary?

Duncan, Ill., April, 1883.

W. H. GRAVES, 38.

Thank you, friend G., for your ideas in regard to a honey-house. I know it ought to be in the A B C book; but with the present stress of business, I hardly see how I can undertake it just yet. Besides, there are many points, it seems to me, as yet rather undecided. It is growing, and will be soon fully grown, I trust.—I heartily agree with you in regard to marketing honey. If you will take notice, most of those giving reports, or at least many of them, do tell what they receive for their honey. And I hereby ask the friends, when sending in the reports, to be sure to state what their honey sold for.—We are considering the matter of making the JUVENILE full size; but how about the price, friend G.? An even dollar seems to be so handy, we have hesitated to make any change in the price. May be we can soon make GLEANINGS semi-monthly at an even dollar. We shall see.

## Heads of Grain, From Different Fields.

### SOFTENING CANDIED HONEY BY STEAM.

**F**OR several years I have been experimenting on the best way to get candied honey out of the combs in the spring. I think I have experimented away fifty dollars. My last invention, although very simple, is a grand success. The boiler for dissolving the candied honey in the frames, ready for extracting, is made thus: Make it  $\frac{3}{8}$  of an inch longer than the top-bar of the longest frame you use, and  $\frac{3}{8}$  of an inch wider than the top-bar of the shortest frame you use. This will let your longest frames in lengthwise, and your shortest frames crosswise. Now if you have an intermediate frame, all you want is a cross-piece to lay across your boiler. You want your boiler 4 or 5 inches deeper than your deepest frame. Next take a strip of the same material of which your boiler is made (which should be of galvanized iron for several reasons), 2 in. wide, and as long as will go around your boiler inside. Double this in the shape of a V, and solder the two edges inside  $\frac{3}{4}$  in. from the top of your boiler. For ends of frames to rest on, this strengthens your boiler; so if you should not want to store honey in it, you can handle it without injury. It also lets your frames down so you can store it full of frames; and as I use mine for carrying frames back and forth for extracting, I can cover it up so that bees and flies are shut out.

### HOW TO USE THE BOILER.

Set your boiler on the stove, with 2 inches of water in it; make up a good fire; commence to uncap, and set frames into your boiler as fast as you get uncapped. When your boiler is full, begin to extract with the first frame you put in. The steam will dissolve the honey, and warm the comb so it will not break. If any should be so cold or so old as not to be all dissolved, put it back for a few minutes.

### COOKING FOOD FOR STOCK, BY STEAM.

I use my boiler in winter, having quite a number of hogs on my hands; and corn being high, I thought I would try cooking feed. I appraised my hogs at the time I began to fatten; have weighed all the corn fed; after deducting feed and value of hogs at the time I began to fatten, I have eleven dollars apiece for labor, besides the manure, which fully pays all labor. One of my neighbors has fattened 5 hogs on raw corn, and he says the corn is worth more than the hogs will bring; so you see here is quite an item.

W. H. BALCH.

Oran, N. Y., March 16, 1883.

Your plan for softening honey by steam is hardly new, friend B. Does not the water from the condensation of the steam dilute the honey so much as to render it unsalable? It is true, it would be just as good for feeding bees; but if you want it to feed, why not hang the frames directly in the hives? We have never had any candied honey that we could not feed out in this way, especially if we give it to them during warm weather when they could get water.—Your idea of cooking food is good, and I believe it has been well demonstrated that it pays a good interest on time and money invested for feeding any kind of stock.

### ANOTHER PLAN FOR WATERING BEES.

You no doubt remember, friend Root, that I am a strong advocate of water for bees, and of having it plenty and convenient for them, as they will take water the nearer the better, while they often pass over flowers containing honey, and fly half a mile or more before they attempt to load up. I have read of and seen a great many devices for watering bees, and I will now give you mine, and ask you to try it, and see if the bees don't take it sooner than any thing you have seen. Take a board 12 in. wide, or wider, and from 10 to 16 ft. long, suited to the number of colonies; now nail strips 2 in. wide all around the edges, water-tight; in short, make a trough one inch deep. Place it in or near your pump or spring, one end from 10 to 12 in. higher than the other; fill and round up the trough with sawdust, leaving the top uneven. Now place a salt-barrel, or some other kind, on the upper end of the board; make a small hole in the bottom, so that the water will trickle out, and fill it up and cover tight, to avoid drowning bees. When the sawdust is once saturated it will take but a small drip to keep it so. Basswood sawdust seems to do best. Once a week put a handful of salt in the barrel. Bees seem to like to take water from sawdust, better than any thing else, and no danger of drowning.

JAS. A. SIMPSON.

Alexis, Warren Co., Ill., April 9, 1883.

### A WORD ABOUT QUININE.

Why do you say our first physicians pronounce against the use of quinine? I supposed—and I mean to keep informed in such matters—that our greatest doctors regarded this alkaloid as one of the safest and very best of tonics—an invaluable medicine.

A. J. COOK.

Agricultural College, Lansing, Mich., Mar. 8, 1883.

Thank you, friend Cook. I got my information in regard to quinine from a homeopathic doctor, if I remember correctly; and as quinine is in such common use, I am very glad indeed to be told that it is not among the remedies to be avoided. Very likely you are right, and I am glad to know it, because it would be a sad thing for so many of our competent physicians to make a mistake in such a matter.

### GOOD CANDY, ETC.

I am losing some of my bees. Those that had sealed honey some time ago are out now, and I must feed or lose them. I can not make the Good candy so but that the bees will suck out the liquid, and the grains of sugar will fall to the bottom of the hive like sand, and be wasted. I think of trying to melt honey and sugar together, and pour into a comb and hang in the hive. If I lose all the bees I have, I shall save combs and get some more bees to fill up again.

WM. FULLER.

Woodville, Wis., Mar. 27, 1883.

I know, friend F., that we have this trouble with the Good candy. If some way could be devised so it would entirely break the grain, so that the bees may consume it all with the honey, it would be ahead of any bee-candy yet invented. Maple-sugar cakes soaked in honey would probably answer all purposes; but, unfortunately, maple sugar is more expensive than our granulated sugar of commerce. While granulated sugar is sold at 10 cts. per lb., we have to pay 12 cts. for the best quality of maple sugar; and

even then maple sugar contains much more foreign matter, besides the larger quantity of water, than the perfectly dry granulated sugar. I am inclined to object to melting the sugar, or using heat in any way, if we can possibly avoid it. If some kind of a mill could be used that would grind up the granulated sugar and honey together, so as to completely break the grain of the sugar, perhaps it might answer our purpose. The honey and powdered sugar could then be molded into little cakes which would probably dry sufficiently on the outside so they could be handled easily, while the interior is in a moist state, just about as the bees would want it.

#### A YOUNG QUEEN LEADING OUT THE FIRST SWARM.

I wish to relate something I do not see mentioned in the excellent manuals or bee journals. In early spring of 1880 I clipped the wing of a nice young queen, and in 1881 (May 29) a swarm issued with a young queen, and did well. In 1882 (June 21) the same was repeated again, leaving the old queen, and this winter the first-named colony dwindled until March 17; the last bee and the queen that was clipped died; now, was it not strange that young queens should leave each time?

#### DOES THE LOSS OF A LEG IMPAIR THE USE OF A QUEEN?

From the most prolific queen I now have I cut a leg off in clipping, in 1881. I think it strange it did not injure her usefulness, but she now has brood in all stages. JOS. K. HARVEY.

Scranton, Pa., March 29, 1883.

Friend H., there are exceptions to almost every rule in bee culture. The case you mention is a marked exception. It is possible that the clipping of the queen may have had something to do with this. In all cases heretofore coming under my observation, where a young queen led out the first swarm, we have invariably found the old queen missing in some way, decrepit or crippled.—I am inclined to think the case you mention, where you clipped the leg of the queen, that she produced less brood than a perfect queen would have done. We have had experience with many such crippled queens; but on careful observation concluded the loss of the leg usually impaired their ability to lay rapidly.

#### A SELF-MADE BEE-MAN.

My bees are all in splendid condition in cellars. I hope they will get through all right. I have but 21 colonies, but they are all Italians, and in Simplicity hives. I have all the necessary implements and machines for making hives that I run by a one-horse power except a machine for making one-piece sections and a foundation mill; but I am thinking of getting some before long. I raised my queens myself last summer, and succeeded well. I have a lamp nursery. I make my foundation with plaster molds that I made myself on the Farls plan, with some alterations. It works well, but I am thinking of getting a Given press. I made my saw-table, and got every thing all up for making hives myself in my spare hours. I never learned any trade, but I have done it by the instructions found in the A B C book, with the changes I thought would suit my case best. Every carpenter who has seen them says I have learned the trade. Perhaps I think more of

them than I would if they belonged to somebody else; but any way, I make my hives very well and quickly with them. I shall not advertise at present; I can sell all the hives I can make without advertising, as I work only in my spare hours; but next summer I think I shall have more time to devote to it, as I shall have more help.

J. V. BELLEFLOWER.

Montreal, P. Q., Can., March 1, 1883.

#### A GOOD REPORT FROM THE ASTER.

I have taken 100 lbs. of comb honey from a single colony of bees, gathered from the aster, in the month of October. It begins to bloom Sept. 15; it blooms until frost, which generally comes about the 1st of Nov. I have seen its fresh blooms in December. I have no idea how much honey this country could produce; but I suppose the pounds would be increased 100 fold if the people would equip themselves with bees and other facilities.

I. R. Good, of Nappance, Ind., passed through this country a few days ago, on the lookout for a suitable place for queen-raising. I think he will do well here, as he has already created, by his flying trip through this part, a great excitement about queens and pure bees. Everybody is anxious for him to settle here.

Tullahoma, Tenn., April, 1883.

T. A. GUNN.

#### SAWDUST IN LIEU OF CHAFF.

Last fall I packed in Novice's chaff hives 60 colonies; in single-walled hives with store box set over, and intervening space filled with sawdust, 6 colonies; also six nuclei in chaff hives. The hives were all placed on the ground, and sawdust heaped up all around, except at the entrance, from 6 to 10 inches. The bees were confined on from two to ten frames, according to size of colony and amount of honey in combs, by the use of sawdust division-boards, the space between division-boards and hive being filled in some with sawdust. Where space would permit, the frames were separated from  $\frac{3}{4}$  inch to one inch. On top of frames were placed three or four  $\frac{3}{8}$ -inch strips crosswise; and over these, lengthwise, several 1-16-inch strips, comb-guides broken in two. Over this arrangement was a clean burlap, and over all a ten-inch chaff cushion. I forgot to say, by the way, that a good part of my hives are stuffed with sawdust, and I am of the opinion that good sawdust, from facts seen in connection with my case of bees, is superior to chaff, the only objection being its weight.

On Monday, the 9th, I examined every hive, removing sticks, and pushing frames up to the proper distance apart, took off burlaps to keep clean for next winter, putting on enameled sheets instead. After getting through, I felt like giving a "hurrah" for the chaff hive and the L. frame, for I found every colony alive; two were queenless, and one lady the ruler of a nucleus, who had not yet learned spring had come. But a section of honey placed over the frames brought her around, and to-day she is laying. Excepting these three, my bees are as strong to-day as they were last fall when put away, and some a good deal stronger.

GEO. F. WILLIAMS.

New Philadelphia, O., April 11, 1883.

The queen I got of you last June proves to be a beautiful one, and her little "bairns" are wonderful workers. Though she is not a very prolific queen, she has a fine large swarm in the hive, which are working finely now, with several frames of capped

brood. The bees last fall had crowded her on 2½ frames, and filled the rest of the frames with honey, instead of making them "stand back and give room." But I must not forget the report of my neighbor.

FROM 1 TO THIRTY-SIX, AND 140 LBS. OF HONEY.

Hurrah for the "Lone Star" again! as she beat the world last year in amount of honey from one queen, she now beats the world again in increase from one queen. C. W. Law, on Honest Ridge, a neighbor of mine, from just one hive last spring increased to 36 swarms, including two that he knew got away, and might have lost more. His original hive swarmed 7 times; the two first swarms that came out, each five times; others, 4 and 3 times, till he reached the astonishing number of 36. This statement can be vouched for by nearly all his neighbors. Several of them assisting him in the care of them, and say "it's so," and are willing to testify to the same. He was urged to make a report to some bee journal; said he took no journal, nor knew of any one, and declined for that reason; but he says the above are the facts. The highest number reported in GLEANINGS that I have seen is 39 from one hive and one nucleus, which does not equal 36 swarms from one hive. Is not Texas entitled to the banner in both bees and honey? From one hive he made or took 140 lbs. that he noted, but did not know how much he took in all.

CHAS. M. BUTTOLPH.

Frosa, Limestone Co., Tex., March 28, 1883.

This is indeed wonderful, friend B. I think Texas is coming in close for the banner. We should be glad to hear from your neighbor. I suppose he is going to keep on and tell us what he can do another season. Such a report seems almost improbable; but with a long season and an uninterrupted flow of honey, I suppose it would not be a very difficult matter. We are glad to know he lives on "Honest Ridge."

#### WOOD SEPARATORS.

Last year I used wooden separators entirely; I like them well. I think I had only two or three cards fast to the wooden separators, and some of the frames were filled three times. I wintered the most of my bees on their summer stands, packed, and in that condition I have lost only two colonies in five winters, and one of them was a drone-laying queen. I have 43 colonies at this time.

AN EMPTY HIVE UNDER THE BEES FOR WINTER.

I experimented on one colony, a young swarm. I set said colony on top of empty hive; no frames in lower hive, and no bottom in upper one. I moved the hive back on the bottom-board, so that there was a one-inch hole the width of the hive, and the entrance open full width. The result was less dead bees of any colony in the yard.

E. E. SMITH.

Pittsford, Mich., Apr. 13, 1883.

#### NOT "BLASTED HOPES," BUT "SMILERY."

Last month my husband, H. O. Morris, gave you an account of his accident at the bridge, and asked for a place in Blasted Hopes. You did not put him there because he so miraculously escaped death. You thought, too, that he should not have taken the risk of crossing at such a time. The stream was not so much swollen as to be dangerous to cross. The bridge went down because the timbers were thoroughly rotten. H. O. neglected to state this fact to you, thereby gaining unjust censure for himself. However, I agree with you in not thinking him a candidate for Blasted Hopes; and I told him if he

wrote for that department I should write for the Smilery. I am so thankful that his precious life was spared, and we have the prospect of another pleasant summer's work among *our bees!* Besides, at our town meeting an appropriation was made to pay the damage to property caused by the falling bridge.

FROM 22 TO 42, AND 2500 LBS. OF HONEY.

Last spring we had 22 colonies of bees, and increased to 42, and obtained 2500 lbs. of honey, leaving plenty for them to winter on. The work of caring for them was so great last summer that H. O. needed an assistant, so I hired a girl to do my house-work, and I did bee-work, which is not so hard, and pleasanter, than the former.

BEE-STINGS AS A REMEDIAL AGENT, AGAIN.

The occasional stings I get rid me of an old enemy; viz., salt rheum. When I work among the bees it does not trouble me at all. Once during the past winter it came out, and was so annoying that I went to the cellar, where we keep our bees, and induced one to come out and sting me. It did not object in the least to doing me this favor; in fact, bees are nearly always ready to sting, if properly dealt with. My salt rheum has not appeared since. We always winter in the cellar, and have never yet lost a swarm. KEEPING THE BEES IN THE CELLAR UNTIL APRIL.

Our 42 came out very strong and active the 5th of April. People here who had them out earlier must have lost largely from their flying when they would have been better off in the hive. I have invented a cheap and easy method of putting on sections, but will not describe it now, lest my letter be too long.

Tiskilwa, Ill., March 16, 1883. COLA MORRIS.

#### MAPLE HONEY, AND HOW TO GET IT.

My bees are doing well on the maple; not on the flowers nor buds, but on the sap. By the way, let me give you my recipe for making maple syrup. I put a handle 10 or 12 feet long into a sharp hatchet or small ax, and make a slight cut 12 or 15 feet from the ground in the south or south-west side of the maple-trees, either hard or soft; that is all I have to do. The wind and sun will turn the sap as it runs down the tree to syrup before it reaches the ground, and the bees will volunteer to gather it; they'd rather do that than rob each other. One hundred swarms can successfully tend a camp of 200 or 300 trees, if they are in proximity. The birds and bees taught me this.

JUSTUS BUTLER.

Leipsic, O., March 28, 1883.

Why, friend B., you are infringing on Mr. Merrybanks' plan of running a sugar-bush and apiary all together. I don't know but your plan will really work. We have got the maple-trees, but we have hardly enough bees this spring to make a good show in a sugar-camp of a hundred trees.

#### NEW SWARMS GOING 30 MILES, ETC.

I happen to be situated so as to learn something about bees which is certain, as I brought and owned the first bees that were ever known to be in this part of the country. There have been no wild bees seen here; in fact, there are none.

#### HOW FAR DO BEES FLY?

My bees, when pasture was scarce, have gone 3½ miles. Some hybrids left their owner last spring, and were hived something over thirty miles from the place of exit; but that was about the nearest timber that a bee could get into.

BEES WITHOUT WINGS, AND HOW IT CAME.

I had some bees hatched without wings. They

were from some larvae belonging to hives that were sent to me in September, and were so badly put up that most of the bees had perished. I like your journal well. I like the way you advocate the cause of Christ. This is new country. When I first came here there was scarcely a house in the county.

Sweetwater, Tex., Apr. 14, 1883. J. C. TURNER.

Thanks for the facts you furnish, friend T. The distance you name just about agrees with our experience; namely, that bees will fly for stores from three to three and one-half miles. That is, that agrees with our experience in our locality. In regard to the hybrid swarm going 30 miles, I should think you must be mistaken somewhere. A swarm of bees seldom moves faster than a man can run, do they? say five or six miles an hour. To go 30 miles they would have to fly 5 or 6 hours at one continual stretch.—I have often seen wingless bees, caused by injury to the brood before it is hatched. The same way queens often get out with imperfect wings where the cells are handled rudely, or where they are cut out before the queen is nearly ready to hatch. In cutting cells for the lamp nursery, we prefer not to move them until just before the first queen hatches, then we seldom have any trouble in wingless queens. Thanks for your concluding words.

#### FROM 100 TO 150, AND 13,000 LBS. OF HONEY.

I send you my report of crop of 1882. Wintered outdoors with good success; hives light in spring. Cause, very mild winter. As the spring was cold, wet, and late, June 15th found us reduced to only 100 colonies, having reduced by selling and doubling up, to have all *strong*. Well, the flood of honey came, and in less than 3 months we had taken 1000 lbs. comb and 12,000 of extracted honey; also 50 new colonies. This honey is nearly all sold at 20 cts. for comb and 10 for extracted. We have no linn. Our crop is from clover and smartweed. My crop of 1881 was an average of \$7.00 per colony from 100 hives. My expenses for cans, express, and commission, was \$200 last year; the other year, about \$100. My secret of success is strong colonies.

J. E. WALCHER.

Millersville, Ill., March 10, 1883.

#### A BRIEF REPORT OF LAST SEASON'S DOINGS AND WINTERING.

I started in the spring of 1882 with 10 colonies; increased to 80 and got 1000 lbs. of honey. When winter came on I had sold down to 24; went into winter quarters with 24 colonies; came out the first of April with every one, 24, in splendid condition.

#### MODE OF WINTERING.

In large chaff hives, with space from 6 to 10 inches for chaff; no division-boards, entrance,  $\frac{3}{8}$ x8. I use the new Quinby frame, 11 $\frac{1}{4}$ x16 $\frac{1}{2}$  outside measure. I could not be induced to go back to the Langstroth. I have my hives so arranged that I do not have to fuss with broad frames, sections, racks, separators, etc. The 4 $\frac{1}{4}$ , or pound section, just exactly fits inside of the Quinby hive (the hive described in Quinby's new "Bee-Keeping"), which is 17x12 inside measure; 4 of the 1-lb. sections just take up the 17 inches lengthwise; 6 rows just take up the 12 inches, lacking  $\frac{3}{4}$ , just right for slipping in a board to key up. Three tiers can be used in one upper story, and it can either be used for section-erate or shipping-erate, or extracting, or a common bee-hive. The

bottom of the lower tier of sections comes within  $\frac{1}{4}$  inch of the frame in the lower story, and there is nothing between them.

#### DEVELOPING A HOME MARKET.

I sold, last season, \$557 from the bee business; have sold this spring 10 full colonies at \$10 per colony. I had not enough full colonies to meet the demand. I have never shipped any thing yet. I have established a home market, and have all I can handle. It's better than farming, so I let the farming into other hands.

A. H. DUFF.

Flat Ridge, O., April 8, 1883.

#### CAN A BEE FLY AT THE RATE OF 90 MILES AN HOUR?

On page 134 of this month's GLEANINGS, Mr. Doolittle endeavors to show that bees can fly 90 miles an hour. I have often noticed that, with a breeze blowing at the rate of 6 or 8 miles an hour, bees flying against the breeze travel but little faster than a person walking an ordinary gait; and bees flying against a wind blowing at the rate of 18 or 20 miles an hour make no headway at all, and get along only by taking advantage of windbreaks, such as trees, fences, houses, etc. A wind at the rate of 60 miles an hour is said to be a hurricane; and a wind at the rate of 90 miles an hour would take Mr. Doolittle's bee-hives out of his yard like chaff in a common breeze.

Our bees travel from 6 to 16 miles per hour (I think), governed by the wind and the loads they carry. Last season our bees averaged over 200 lbs. per colony. If Mr. Doolittle's bees can fly 90 miles an hour, and possess equal strength as honey-gatherers, comb-builders, etc., with such a season as we had he should obtain an average of 1000 to 1200 lbs. per colony.

S. A. SHUCK.

Bryant, Ills., March 10, 1883.

#### A BLUE-EYED BABY, GOOD NEIGHBORS, AND OTHER BLESSINGS.

I have felt lost without GLEANINGS, but could not send before this year, on account of a blue-eyed baby that the good Lord has sent us. I have 97 swarms of bees in double chaff hives, in good condition, and am making a success of bee-keeping. Mr. G. M. Doolittle has been a very kind neighbor, and I am largely indebted to his instructions and counsel for my success. I want to thank you also for much help and encouragement.

A. L. EDWARDS.

Skaneateles, N. Y., March 28, 1883.

May God's blessings rest on the baby, my good friend E.

#### APIARIAN EXHIBITS, ETC.

I notice after the premium list of the Tri-State Fair, in the honey department, you say you gave it to show what Ohio is doing. Really, are you getting to think that Ohio is all there is left of this world? I should not think you would have forgotten Michigan after your visits to it, and your frequent notices by Cook, Hutchinson, Heddon, and many others, that it yet exists. Indiana, too, by what I see occasionally in GLEANINGS, is yet in existence. Are you not aware that these two States have as much to do with this fair as Ohio has? Perhaps you think because the committee that have effected this are Ohio men, Ohio does it all. But that committee owes its appointment to a Michigan man.

#### BEE-FEVERS, AND THE REMEDY.

Mrs. Harrison's way of curing fever is superb—none better; but in my practice I have found a few small doses of quinine and cayenne good after they

were cured to keep them cured. She is excellent in prescribing for the bee-fever; perhaps she can give a remedy for "small sections on the brain"—the prevailing disease among some bee-keepers at the present. My remedy is a warm bath, followed by three grains of good sense, hourly, if the patient can stand it; if not, all he can stand.

E. B. SOUTHWICK.

Mendon, Mich., Apr. 9, 1883.

I really beg pardon, friend S. It must have been my absent-mindedness that made me mention only Ohio. I commend your remedies, especially the last ones.

#### SENDING FOUL BROOD TO MICHIGAN, ETC.

Page 171, April No., contains the request that you please keep Prof. Cook reminded that infected bees will be sent him, etc. Allow me, as a Michigan bee-keeper, to solemnly protest against sending foul brood to this State on any pretense whatever. I trust Prof. Cook won't be the first to allow our law against the spread of foul brood to be broken.

Abronia, Mich., April 9, 1883. T. F. BINGHAM.

I agree with you in the main, friend B.; yet if, by letting a single colony of foul brood come into the State of Michigan, to be used only by a careful man like friend Cook, for the purpose of getting a perfect remedy for foul brood, it seems to me the good would overbalance the evil. Would this not be copying the law in spirit, not in letter?

Here is a line from Prof. Cook himself on the matter:—

*Dear Mr. Editor:*—Upon further consideration I think it would be unwise to have foul brood sent to me here. It is not a good material to send about the country. So I have written to Mr. Muth not to send it. Practically this will make no difference; for, like Mahomet and the mountain, if the mountain won't come, Mahomet will go. I can go where foul brood is, and try the experiment. A. J. COOK.

Lansing, Mich., Apr. 11, 1883.

#### HONEY-DEW, NOT ALWAYS DARK HONEY.

Let us look at our bees. They did very well for me last season, and went into winter quarters in extra good shape, I thought, for they were very strong, and had plenty of honey. I went into winter with 32 or 33 swarms, and at the present writing they are half of them dead, and I do not know what to think. I have heard people talk about honey-dew, but I never "swallowed" any of that until last fall, and then I had to give it up, for we had considerable of it. I could not see what my bees went to the woods so early in the morning for, so I followed, and found the maple leaves wet with dew; and it was sweet, and the bees busy gathering that sweet. This was after the honey season was over with us, or nearly so, and they made a nice lot of honey; but it was not as thick and heavy as clover honey. My cousin, some three miles from me, noticed the same thing I did. The honey was very fair and clear. Could that have anything to do with my bees dying. There are others who are losing as well as myself. All of those colonies that have died have left plenty of honey. I do not take GLEANINGS now, but I get it to read, and I prize it very much. The Homes are worth all the book costs.

#### RASPBERRY HONEY; IS IT POOR?

I saw an article in a Cincinnati paper, calling the honey that the bees get from the raspberry blossom not very good, being dark, and, I think, bitter. There

are a good many raspberries cultivated in this neighborhood, and everybody wants a section or two of the honey. We think it very clear and thick, and I think there must be a mistake about its being poor.

Z. D. ST. JOHN.

Gustavus, Trumbull Co., O., April, 1883.

I think it is a mistake about raspberry honey being poor, friend S. I think it quite likely that the one who wrote the article had got some apple-tree or dandelion honey in place of it, as raspberry blooms at the same time as apple-tree and dandelion. That from the latter is always dark and poor, if I am correct. I am glad to have you bring out the point, that honey-dew is not always dark and bad, and very likely it had something to do with your loss of bees.

#### ANOTHER DISEASE OF THE BROOD.

I should like to call attention to a brood disease that has nearly ruined bee-keeping in this part of the country. It is so insidious and obscure that it has not been noticed by any one else, so far as I know, till I called attention to it. The young bees die in every stage, from the egg to the perfect bee just emerging from the cell. But I am not aware that the adults are affected by it. It seems to be very slow in its progress; and as I noticed it for the first only last summer, I can't tell yet how long a colony may be affected and survive.

In the early stage of the trouble, the dead seem to be promptly removed; but after the worker force becomes much reduced, the dead can be found in all parts of the brood-nest. But all do not die; even to the last, some come out apparently healthy, till eventually the stock is weakened so that it is devoured by the moth, or perishes of cold in the winter. So far as I have been able to observe, it is attended with very little, if any, offensive odor. I have tried starvation, salicylic acid, salt, sulphur, etc., without any apparent effect. I also quarantined an affected colony for 36 hours, as recommended for foul brood, and then put them on new foundation with pure surroundings, and fed with syrup of granulated sugar; but they carried the plague with them in its most virulent form.

I am now satisfied that I have had it amongst my bees for more than twenty years, and that it has reduced my apiary from more than sixty strong colonies to three weak, worthless hives. I have no doubt it is one of the types of foul brood of which you speak, page 93, in the A B C. I think I have reason to believe that this trouble prevails to a great extent in Western Pennsylvania and Eastern Ohio, and perhaps elsewhere. But it is so obscure that it would hardly be noticed, except by the most careful observers. I wonder if it would surprise my old friend (and your correspondent), D. Binny, Esq., of Addison, Michigan, to inform him that this disease is what destroyed his apiary when he resided in these parts. Has friend Muth, Jones, Cook, or any other of your readers, noticed this form of "Blasted Hopes"? If any one is acquainted with it, and can give a remedy, or any information on the subject, I shall be pleased to hear from him.

MILTON HEWITT.

Perryopolis, Fayette Co., Pa., April 6, 1883.

I do not think I have ever met any thing quite like the above, and hope it is confined to one locality, and not contagious. Can others throw any light on it?

We have a pretty slim story to tell this spring. Every one around here has lost heavily, several losing all they have.

#### SUGAR SYRUP VERSUS NATURAL STORES, AGAIN.

One man started last fall with 25; has 5 left. Another had 9; has one left. Another had 10 or 11; has one left. M. L. Spencer had rather better success; he thinks he will save 50 out of 65. For myself I have 4 out of 16; one is very weak, which will be no profit if they live. Our imported queen you sent us last fall has gone with the rest. I think I have learned something in regard to wintering. I had one swarm that I extracted all the honey from last, and fed up on sugar syrup; then buried *a la* Hutchinson. They came out strong, and perfectly free from disease, as far as I can see. They did not show more than a teacupful of dead bees on the bottom board. I buried 9 in all; lost 4 of them, one of which was drowned out, or smothered, water coming up above the entrance before I knew it. I had 5 out, buried in the snow, all of which died. All had dysentery. Another point: Those 5 had no honey taken from them last season, and it was badly candied in the combs; those that came through were fed up with syrup, when they needed it, and I extracted from them last season a good deal too.

H. D. RURDICK.

Little Genesee, Allegany Co., N. Y., April 14, 1883.

#### HONEY-DEW BAD FOR WINTERING.

I have come to the conclusion, and I now think not to change from it, that when bees get their stores from the woods in the fall, dysentery must surely follow. It has always done so with me, except last year, when I had one colony of Italians that gathered late, and had their hive pretty well filled with bark-louse honey, which came through all right; and I might here say that that have caused me to risk 20 colonies this season, forgetting, of course, that last winter was very open, and bees flew nearly every week. Therefore let all bee-keepers rear a pillar right here, that where stores come in such profusion from the timber, in the fall season, and such stores are dark and strong, bees must have their winter stores from white clover, linn, or some early, healthful, white honey or granulated sugar, or have a bee mortality. The loss must be large in this locality, and wherever the so-called honey-dew was gathered.

#### ITALIANS MORE APT TO GATHER HONEY-DEW THAN BLACKS.

My black bees are not so badly affected as my Italians, nor have they ever, to my recollection, suffered so greatly. The reason is, the Italian is not so choice in his selection; or, in other words, the black wants the best or none; when the Italian can not get the best, he takes the next best, and so on.

Jerome, O., Jan. 24, 1883.

R. McCROBY.

#### WOODEN RECEPTACLES FOR HONEY; HOW TO MAKE THEM IMPERVIOUS.

I expect to have a honey-tank made of wood; can it be painted on the inside without injuring the flavor of the honey?

M. A. JACKSON.

Bangor, Ia., Apr. 17, 1883.

Do not by any means have your tank painted inside, friend J., but coat it well with *hot* paraffine. Be sure that your tank is not only perfectly dry before you attempt to apply the paraffine, but that it is also as warm as you can get it—either by a fire or

in the hot sun. Paint would be very apt to materially injure the flavor of the honey. The method of coating the inside of honey-barrels has been so fully described in A B C that it seems hardly best to repeat the process here.

#### CAN BEES BE MADE TO SWARM TOO EARLY?

An A B C scholar wants to know if there is any danger of feeding too strongly this month. It is wonderful to see how my bees dive into the rye meal and molasses. Is there any danger of their wanting to issue swarms before bloom comes, to enable them to work and live? A bee-man told me there was; how is it?

J. W. C. GRAY.

Atwood, Ill., March 16, 1883.

I don't think there is any danger of swarms too early. I know there are some who think it not advisable to have very many bees before the honey comes; but my experience has always been most favorable with the strongest colonies. If I could feed bees so as to get them swarming in March, it would be exactly what I should want to do. If they were not ready to gather honey, I could do just as well in selling them by the pound. We have now, as we have almost every season, orders for bees at \$4.00 a pound, and have not bees to fill them. Would not this pay, friend G.? If any one should have too many bees in April, it seems to me he could very easily get rid of them by a little advertising.

#### MACHINES FOR NAILING FRAMES TOGETHER.

On page 61 of your February number friend Hunt gives us a sketch of a block to nail frames on; and as I know they are very handy for one who makes his own frames, and that bee-keepers generally wish things handy, I will tell you how mine is made. It is the same as his, only in place of the buttons which he has to turn every time he makes a frame, I use a little wooden spring; a straight-grained piece of pine is best, for it keeps its place better than hard wood. By the use of the springs, all you have to do is to shove your end-pieces from the bottom up in place; and when the frame is nailed, take hold of the bottom and lift it out. When my frame is in it is a trifle fuller than the block, which makes it handier to nail.

#### MAKING FDN.; IS IT MONEY-MAKING BUSINESS?

I make every thing I use in the apiary, excepting fdn. That, I have to buy or get made. I have now 22 lbs. of nice wax which I am going to have made on the Given press. The man who owns the press asks me 25 cts. for making it; is not that a big price? I read in GLEANINGS that two men will make from 100 to 200 pounds per day, which looks like big wages—\$25.00 at least. Now, friend Root, do you think it is just right for one bee-keeper to charge another such prices? It doesn't look so to me.

R. P. LOVEJOY.

Greig, Lewis Co., N. Y., Feb., 1883.

Friend L., if you think the manufacturers of fdn. are getting rich so fast, why do you not get a mill and get rich too? In the A B C I say that two hands may dip 200 lbs. a day, and also that two hands more can roll about the same amount. This would make four hands. Now, aside from this, considerable time and expense are required to keep the utensils in order, slick up, and put things away, and many other little incidents

that come up in our wax-room. We turn out about 200 lbs. a day, and we employ about two men and perhaps half a dozen girls besides. This includes putting paper between the sheets, boxing, unloading wax, weighing, and many other little details. Our wax now costs us from 38 to 40 cts., after it is freed from dirt and impurities. We get on an average, perhaps 50 c., after paying for boxes, paper to put between the sheets, etc. This gives about \$20.00 for the day's work. The wages we pay would be from \$8.00 to \$10.00, and we have \$10.00 left to pay for room and machinery, interest on money, etc. Do you think it pays very much better than most other industries?

#### FRIEND MALONE'S FOOT-POWER SAW.

As I have that foot-power saw at work, I thought it might be of interest to some to tell how it is made, if I cau, and how it works. The frame is made of 14 pieces, 3x4 seasoned hickory. It is 30 inches wide, 48 long, and 38 high. There are 4 pieces around the top, 4 around the center from top to bottom, 4 posts, and 2 lengthwise on top for mandrel to rest on. Then there is a frame made of 1½x1½-inch stuff just like the top of frame, to lie on top. This latter is fastened at one end with hinges to the frame, and the other end to raise or lower. There are 2 tables, one on the left hand, stationary, 15 inches wide, and one on the right-hand side, that runs on tracking. There are two gauges, one on the left for rip, and on the right for cross-cut. The wheel is 39 inches diameter, 6-inch rim, and 3-inch face. This gives the saw 20 revolutions to the wheel's one. The wheel is hung on an iron shaft, one inch square, bent for crank. It runs on steel points, with set-screw, just like the \$2.50 mandrel. This part is where I think I beat friend Hutchinson. There are no heavy bearings, and it runs like a top. It cost me \$10.00 in money and \$12.00 in work. An old wheelwright made it for me. W. M. MALONE.

Oakley, Ia., Feb. 11, 1883.

#### CHICKENS IN A BEE-YARD.

Have any of the fraternity ever tried keeping chickens in the same yard with bees? Will the chickens eat the bees? Will the bees sting the chickens? Is there any other objection? I should like an answer from some one who has tried it.

New York, N. Y., April 18, 1883. F. D. CLARKE.

Yes, friend C., I have tried to keep chickens in a bee-yard, to my sorrow. Ours never ate the bees, that I know of, but we have pretty conclusive evidence that chickens sometimes learn to eat them. The trouble they made with us was in tearing up the sawdust in front of the hives, and scratching things right and left generally. Then there is one other feature that is pretty disagreeable, to me at least. When I work at a bee-hive I often get down on my knees, or sit on the ground. Well, where one works that way, it is not pleasant to have chickens about, you know. I presume there is something to be said on the other side. A pet chicken can easily be taught to pick up all the moth-worms that are brought out of a hive, or to grab them up quickly when the bee-keeper pushes them out of the combs, etc. Perhaps some of the brethren have had a different experience from mine.

#### CHAFF PACKING, ETC.

It has been a hard winter on fruit-trees and bees. March was cool; April 16th was the first I noticed bees carry in natural pollen, but they are busy today on flour. I was late with building my bee-house, and it was quite damp; put in 35. Feb. 28 was nice. I gave them a fly, put them in again, and took them out April 9; all lively but 2; 9 packed in chaff appear to work as well as any. About one-half are on summer stand unpacked, but with a windbreak. Lost five of them. I think I should have lost less if a two-inch hole had been in bottom-board, as they were strongest.

E. PICKUP.

Limerick, Ill., April 17, 1883.

#### REPORT FROM MRS. AXTELL.

Our bees wintered very poorly, both in cellar and out of doors; never in better condition than they were in last fall, but will, we think, have all left we can well care for in two apiaries, and the nice combs left by the dead colonies are worth nearly as much for young swarms as if sold last fall, at present prices of honey and bees. We wintered in cellar about 150 colonies, instead of 15, as per Apr. No. If any fault in wintering on our part, it was too many bees in one cellar; but it was kept well ventilated. One of our Chicago commission men visited us yesterday; he says, "Tell them, I-b. sections are just right, but don't by any means make any smaller."

Roseville, Ill., April 18, 1883.

L. C. AXTELL.

## Blasted Hopes.

Or Letters from Those Who have Made Bee Culture a Failure.

ENCLOSED please find — for which send me GLEANINGS, and oblige your friend and brother bee-keeper, who is in Blasted Hopes now. Last fall I had 38 good strong swarms of black bees. The winter was very severe here, with 3 feet of snow on the level. My bees did not have a fly from the 11th of Nov. until about the last of Feb., and the weather still continues cold, with lots of snow on the ground. I had 32 swarms packed in fine dry oat straw, 6 inches thick all around the hives, with entrance open, honey-boxes filled with dry straw, and placed directly over bees to collect moisture; 6 inches of straw over hives, and a good shingle roof over each one; 6 swarms I left unprotected.

#### RESULTS.

Those 6 unprotected are all dead; 14 of those packed in straw, dead, leaving only 18 live ones, and most of those rather weak. My hives are 20 in. long, 12 high, and 12 wide; the 2 swarms in old-fashioned box hives, packed same as the rest, came through splendid.

LEMMON W. ITZENHOUSER.

Coral, Montcalm Co., Mich., March 30, 1883.

Why, friend I., it doesn't seem to me you need to be in haste to get into "Blasted Hopes," for you have done better than we did, as it is. I think your old box hives had old tough combs, and had ample time to prepare themselves securely for winter, while those of the other hives were new colonies built up last season.

#### BLASTED HOPES.

Blasted hopes! blasted hopes! On the 5th I wrote you a letter, and inclosed subscription for GLEANINGS, to commence April 1. I had not yet mailed the letter on the 6th when I went to give a hand to

the bees, when, lo! out of my 11 good swarms I had not a live bee left. I felt all broke up in the business, and did not know which way to turn. Then I happened to think of friend Root as the man to help me out, and so I inclose you the subscription in this letter, and want you to sit down and write me a long letter to tell me how to start again, and to encourage me before I declare bee-keeping a fraud. We have 25 empty hives, 12 of them filled with old comb, containing irregularly about 200 lbs. of honey, for do not think my bees starved. I have also an extractor, smoker, sections, etc., purchased of friend Root, and every thing necessary to bee-keeping, but no bees. Now tell me how you can give us a start, and with what stock you would advise us to start with; for we are thinking of buying of you. You see there is no use in buying bees in hives, as we have plenty of hives now; but what we want is bees. Give us your advice.

BERT E. RICE.

Attica, Seneca Co., O., April 10, 1883.

Is it really a fact, friend Rice, that your hopes are blasted? Is your courage and energy all gone too? and do you still feel all kind o' broke up like? I can hardly think you are so badly off as you suppose. Is it not a ballucination that you are laboring under? Charles Buxton one said, and I think, too, he must have been talking to some poor fellow who almost thought his hopes were blasted, "The longer I live, the more deeply am I convinced that that which makes the difference between one man and another, between the weak and the powerful, the great and the insignificant, is *energy, invincible determination*; a purpose once formed, and then *death or victory*. This quality will do any thing that is to be done in the world; and no two-legged creature can become a man without it!" There! doesn't that make you feel a little less "broke up"? Here is Moody's favorite verse that will certainly help to dispose of blasted or blighted hopes.

For the Lord God will help me, therefore shall I not be confounded; therefore have I set my face like a flint, and I know that I shall not be ashamed.—ISA. 50 : 7.

Hasn't that got the true ring of *manliness*, as well as of godliness, friend R.? and then, you know, Paul said he had learned, in whatsoever state he was therewith to be content. But do you think this is too ethereal or theoretical? Then let me give you something else for your encouragement that is perhaps of a more earthly nature.

By my side sits one of our good bee-keeping friends who is spending a day or two looking about our institution, making it pleasant for us, and perhaps for himself too. It is Mr. McGee, the light-house keeper at Point Marblehead, O. Now, he can sympathize with you. He says that two years ago he lost all of his bees except one queen and a half-pint of bees in one hive, and one queen with a pint of bees in another. He had 106 frames of comb—about the same as you have. He bought no bees nor queens, but by careful management of what he had, he increased to 11 strong swarms, all of which were wintered, and took 369 lbs. of honey besides, 25 lbs. of which was nice comb honey. There, now, isn't that encouraging? and is it not the more encouraging from the fact of its not being an item that I have selected from all the back volumes of GLEANINGS, but that it is the first one that comes to hand?

And now for advice—taking it for granted that your feelings are entirely healed. If you haven't very much cash to spare, just get two or three queens with half-pound or pound of bees with each,

and start as friend McGee did. Your combs with some honey in them are exactly what they want for a start in house-keeping. Pack your combs where neither bees nor mice can get at them. They should be hung at least 2 in. apart, and watched, that the moths do not get in and make havoc; and I am sure that, with a little ingenuity, and perhaps some strategy, you will have quite an apiary in the fall. We shall want to hear of what success you do have, any way. Would advise you to get untested queens and a pound of bees with each in May; these will cost you \$1.50 each for queens, and \$3.00 per lb. for bees. Since you live in Ohio it will do very well for you to order of us; but if you were further away, I would advise you to buy near home, if you can handily, so as to save express charges. Still, if you can get good swarms near home, and buy Italian queens of some dealer, it would be a saving. Many of our reports show great success from 1 lb. of bees and queen in May. Not only will they make a good heavy swarm, but will generally yield a considerable quantity of honey, if they are not used for increase. I see you sign yourself "in need of sympathy." Now just turn to my spring's report on page 202 of April GLEANINGS, and I am sure you will allow me to say that I am yours in sympathy.

Medina, O., Apr. 18, 1883.

WALTER B. HOUSE.

## Reports Encouraging.

FROM 17 TO 44, AND 1600 LBS. OF HONEY.

I STARTED in the spring of 1882 with 17 colonies; 2 lost their queens, and 2 were weak, and increased to 44; I got 1600 lbs. of extracted honey from 14 colonies, and 500 lbs. comb honey from the rest. I put 44 in cellar the 28th of November; took 38 out this spring; 31 are strong; the rest are weak from dysentery; 6 died by the same disease.

AUGUST L. LEHMAN.

Hustisford, Wis., March 28, 1883.

The first year that I received my bees we took 160 lbs. of honey from each hive (chaff), and they have done well ever since.

W. A. SMITH.

Denver, Col., Feb. 27, 1883.

The spider plant and Simpson honey-plant both did extremely well with me last year. I, too, gathered honey from the spider-plant with a spoon.

Kossuth, Miss., Mar. 7, 1883. W. C. HARWOOD.

FROM 14 TO 30, AND 1800 LBS. COMB HONEY.

I started with 14 colonies, and increased to 30; obtained 1800 lbs. of honey, all in sections, 1 and 1½ lbs.

A. REUCH.

Chariton, Lucas Co., Iowa, Feb. 24, 1883.

FROM 1 TO 8, AND —

It has been a hard winter for bees. I started with one swarm last spring and increased to eight. Last fall I united 4, and have 6 good ones now. Bees brought in pollen the 16th.

A. R. WHITMAN.

Norway, Me., April 18, 1883.

Results of one year with one swarm: 64 lbs. of box honey; sold some at 20 and some at 18 cts.; worth in all about \$27.00; cost me about \$18.00. Profit, \$9.00, and one swarm. I am satisfied. I have tried bees before in gums and board hives, but failed every time. I think GLEANINGS is worth more than it costs, so it is a well-spent dollar. It is good in every department—certainly on tobacco.

Cuba, Ill., Mar. 20, 1883.

M. W. MURPHEY.

## FROM 1 TO 5, AND 50 LBS. OF HONEY.

One colony increased to five, and I got about 50 lbs. of honey, from one stand. I think I shall do better this season.

F. P. SMITH.

Greenwood, W. Va., March 24, 1883.

Our bees have wintered nicely so far on the summer stands packed with chaff. Loss so far is 7 out of 175 swarms put away last fall. N. E. PRENTICE.  
Castalia, Erie Co., O., March 20, 1883.

Very glad indeed to hear it, friend P.

## FROM 8 TO 22, AND 1000 LBS. HONEY.

I had 8 stands last spring—one queenless; and I have 22 strong ones, and 3 ran away. Got 160 lbs. of extracted and 810 of box and section honey, mostly section.

STEPHEN JULIAN.

Russell, Iowa.

I will give you my report for the past season. I commenced the season with 20 swarms; have now 49; have taken 1600 lbs. in box honey; most of it was white-clover honey. Bees are in good trim for winter.

S. PARDEE.

Volga City, Iowa.

## FROM 1 TO 3, AND 100 LBS. OF HONEY.

I got 100 lbs. of honey last season from one hive and two swarms. I put them in store boxes, with straw and leaves around them. They are all in good shape.

D. J. COATE.

Laura, Miama Co., O., March, 1883.

## FROM 25 TO 50, AND 3000 LBS. HONEY.

My bees did well this last year. I began with 25; increased to 50, and got 3000 lbs. honey—1800 in 4¼x 4¼ sections, the rest extracted, and think I could have extracted 1000 lbs. more, and left my bees plenty for winter.

J. W. LAMB.

Champaign, Ill., Mar. 19, 1883.

## FROM 12 TO 46, AND 200 LBS. HONEY.

Here is my report: I had 12 colonies of Italian bees in the spring of 1882; increased to 46, and sold 200 lbs. of comb honey, and I have sold 3 colonies at \$10.00 per colony, which leaves me 43 all O. K. Chaff hives are good for cold winters with Italian queens from P. L. Viallon.

ROBERT BLACKLOCK.

Geigerville, Carter Co., Ky.

In the spring of 1882 I bought a very weak colony for \$7.00. last fall I sold the same for \$7.00. I obtained from that colony \$30.00 worth of honey, and three good colonies of bees worth now \$30.00. So my income from \$7.00 was \$60.00, and a good deal of experience. I have five colonies; Gallup hives, all in chaff, and so far are doing well.

J. L. HUGHEY.

Carroll, Ind., April 9, 1883.

## FROM 3 TO 16, AND 175 LBS. OF HONEY.

I received the smoker you mailed Apr. 6, yesterday; have tried it to-day; am well pleased with it. Thanks for your promptness. I had 3 colonies of bees last spring; increased to 9, and extracted about 175 lbs. honey; lost 2—one in winter and one this spring, from carelessness, I suppose, in not feeding.

A. J. LANE.

Rich Creek, Marshall Co., Tenn., April 14, 1883.

## FROM 2 TO 4, AND 100 LBS. HONEY.

I commenced last summer with two colonies; increased to 4 in the fall; had my best one stolen when full of honey; extracted over 100 lbs. of honey. I bought 17 colonies in the fall; extracted the honey from them; fed them sugar syrup, packed them

away in sawdust, and at the present I think they are all alive.

E. J. HAINES.

Cheltenham, Ont., Can., Feb. 27, 1883.

## FROM 80 TO 135, AND 6500 LBS. HONEY.

Dec. 5th, I received GLEANINGS containing notice that I had honey for sale; and on the 6th I received a letter from Michigan, inquiring about the same. How is that for quick returns from advertising? My report for 1882 is, spring count, 80; full count, 135; extracted honey, 4000 lbs.; comb honey, 2500. Total, 6500 lbs. Yield per colony, 81 lbs. Increase, 70 per cent.

J. L. GRAY.

Lee Center, Ill.

## FROM 17 TO 27, AND 1700 LBS. OF HONEY.

I had thought of sending in my honey report; but as I had only 1700 lbs. comb honey and 10 swarms from 17 stands, spring count, and as I see so many reports that far exceed it, I will say nothing more about it, only that, if I could be sure of doing as well every season, I should be satisfied.

G. W. COLE.

Canton, Ill., Jan. 8, 1883.

I dare say, friend C. Seems to me I know of "whole families" that would be satisfied with 100 lbs. to the colony, and over one-half increase.

## FROM 10 TO 34 AND 1500 LBS. OF HONEY.

As I never have given you a report of what my bees have done, I thought I would send one. Spring count last year, 10; increased to 34. Took 1500 lbs. comb honey. Sold by the quantity for 18 cts., and small lots for 20 cts. per lb. Wintered on the summer stands. Lost two; the rest are good and strong. I am selling at \$5.00 per colony; want to reduce them to 15 stands. I have not room for any more. I live in the corporation. My lot is small to keep so many bees.

W. D. ANGELL.

Odell, Livingston Co., Ills, April 5, 1883.

## FROM 39 TO 62, AND 6321 LBS. OF HONEY.

I have delayed my report for reasons mainly on account of sickness. I began the season of 1882 with 39 colonies; increased to 62; sold 4 Simplicities at \$10 each; 1 chaff at \$30.00. Went into winter quarters with 57 colonies—49 in chaff hives, and 8 in Simplicities. All in chaff wintered well. One in Simplicity started on candied honey. Our honey product was an average of 103 lbs., spring count,—all extracted, and we enter the season of 1883 with 56 colonies in good shape at this time. Price of comb honey, 25c; extracted, 20c.

R. H. RHODES.

Arvada, Jeff. Co., Col., Mar. 31, 1883.

## FROM 7 TO 28, AND 2500 LBS. HONEY.

Here is my report for this year. Began in spring with 7 colonies in chaff hives (no loss). Extracted, 2000 lbs.; in 1-lb. boxes, 500 lbs. Sold extracted at 11 to 12c; box, 15 to 18. Increased to 28 in Simplicities, now covered with a pile of straw on each hive. I prize GLEANINGS very much; count "Our Homes" worth at least half the journal. Am much obliged for the JUVENILE. You are doing a good work, friend Root. I am hoping and praying God to spare you, and show you much fruit as the result of your labors of love. I began with one swarm four years ago.

ALFRED MOTTAY.

O. tawa, Ill.

## FROM ONE TO FOUR, AND 75 LBS. OF HONEY.

I commenced the season of 1882 with one stand, and increased by natural swarming to 4—two in American hives, and two in box hives; got about

75 lbs. of box honey (this was my first season). I fed the last and smallest swarm last fall; the rest wouldn't eat any. I suppose they had plenty of honey. I wintered them on the summer stands; they all came through the winter in good condition. I commenced feeding in March again. That is the small swarm, and have kept it up till the present time. I see they are bringing in pollen this morning at 10 A. M. already. It is of a light yellowish color; where do they get it? They are working on the soft-maple now, but I thought that was of a reddish color. Need I feed them when they get natural pollen?

Wyandot, O., April 10, 1883. J. T. HOOVER.

I think the pollen is from the maple, friend H. I think when they get natural pollen they also get some honey, and will therefore not need much feed.

#### FROM 6 TO 20, AND 200 LBS. HONEY.

I will try to make out my report for last summer and winter. I began last spring with 6 colonies of bees (Italians). I ran them for increase mostly. I increased by natural swarming to 20; sold 3 colonies; got about 200 lbs. comb honey. My best colony made me \$30.00 in honey and increase, and have the old hive left. We had a rather poor season; plenty of flowers, but too much cold wet weather. I had to feed a little in the fall. I went into winter quarters with 17 colonies in pretty good condition; part in cellar and part on their winter stands packed in straw. I use tight-bottom hives (Simplicity). I don't give any top ventilation; the entrance of my hives is 6x½ inch, and a 1½-inch hole in bottom, with wire cloth tacked over it. I think this is ventilation enough. I unpacked my bees yesterday, and to-day they are carrying in pollen. I take great pleasure in watching the little fellows at work. I forgot to say that I did not lose any bees in wintering. I find every colony able to "clean house."

A. C. WILLIAMSON.

Matamoras, Ohio, April 9, 1883.

#### FROM 49 TO 141, AND 8 TONS OF HONEY.

In looking over GLEANINGS I notice that a great many bee-keepers give their reports for 1882. I will give you mine as nearly as I can. As I had my bees divided into two apiaries, and labored under considerable disadvantage, I had to estimate the weight of honey by the barrel. I started, spring count, 49 stands; I ran 5 stands for section honey most of the season, or until I got about 500 lbs. of section honey. I then put on extracting-boxes, and ran them the rest of the season for extracted honey. When the season was over, I summed up the amount I had, 32 barrels of extracted honey that would average 550 lbs. to the barrel, or something over 8 tons of honey. I increased to 141 stands, and lost 5 during the winter, and that through neglect. The rest appear to be in good condition. My honey all sold principally in home market, at an average of 8 cts. per pound; section, 20 cents.

JAS. A. SIMPSON.

Alexis, Warren Co., Ill., April 8, 1883.

#### FROM 50 TO 89, AND 12,290 LBS. OF HONEY.

My report for 1882 is this: The first of June I had 50 colonies of bees, all told; increased to 89, and took 12,290 lbs. of honey, nearly all extracted, and all white, except 250 lbs. of fall honey (the fall crop here being a failure), being an average of very nearly 246 lbs. per colony, spring count. The above figures were obtained by weighing one barrel of each different size; but as most of the honey is in 500-lb.

bbles., the figures should be very nearly correct. I should like to add a word about making reports, that I should like to see adopted. If a person winters, say 100 colonies, and in the spring doubles them together down to 75, saving the 25 queens in nuclei, let him report the fact, and not overlook the 25 extra queens, as in a good season they mean a good many pounds of honey.

#### A BIG DAY'S WORK OF EXTRACTING.

As several have reported big day's work extracting, I will add mine. On the 25th of July last, I pressed a young man into the service, who knew nothing of the business. We drove four miles to a branch yard, and extracted ninety gallons of honey, filling two barrels, and left 60 lbs. in the extractor, making about 1140 lbs. The brood-chamber of every hive was examined, queen-cells removed, and frames of hatching brood taken from those likely to swarm, and new swarms built up with the brood taken. The young man did all the extracting, and went home feeling proud of his day's work, even if he did have two or three pretty big fingers, that had shut down on some unlucky bee.

JAMES NIPE.

Spring Prairie, Wis., Dec. 8, 1882.

## Notes and Queries.

**I** OUGHT to add a postscript to my article; for since sending it I have contracted to supply a man with 100 lbs. of bees, which comes from my ad. in last June GLEANINGS. T. P. ANDREWS.  
Farina, Ill., April 19, 1883.

Photo is received; many thanks. I feel as if I knew you better. Bees are swarming every day; am extracting right along from poplar.  
Forsyth, Ga., April 21, 1883. F. N. WILDER.

I will report my success (not failure) to you at some future time; also the "Golden bee-hive" swindle in this country. OMAR P. WHITE.  
Nebo, Cherokee Co., Tex., April, 1883.

#### FIGWORT PLANTS 9 FEET HIGH.

Last summer we had figwort stalks over 9 feet high, and M. O. spider plants 6 feet high.

CHARLES L. SWARTZ.

Rinkerton, Va., Mar. 3, 1883.

#### NEW HONEY.

The honey-knife and GLEANINGS came to hand all right. I like them both very much. I have taken 1000 lbs. of very nice clover honey from 30 hives—extracted. H. B. MORRIS.

Franklin, La., April 13, 1883.

#### ASPARAGUS FOR BEES.

I have nearly half an acre of asparagus, and bees work on it for weeks until the seeds set on it.

JOHN H. MYERS.

Saratoga Springs, N. Y., Feb. 9, 1883.

I began with 10 colonies of bees last fall; lost 4. You may be sure I had the blues some.

Charlotte, Mich., Mar. 14, 1883. T. RICKERD.

[Why, friend R., I wouldn't have the blues because I had lost four out of ten. With those left you can get them back in no time.]

## BEES IN FLORIDA.

Bees are working well; have increased from 8 to 24 colonies of blacks and hybrids since Feb. 1, 1883. Orange City, Fla., Apr. 11, '83. DR. H. S. ALLYN.

My bees are carrying in pollen from the alders. That is the first thing they have to work on, and I tell you it comes in well, because it comes so early. In a few days the maple-buds will be out; then comes the first honey of the season. L. R. WEBB. Salisbury, N. C., Feb. 18, 1883.

## GOOD REPORT FOR CHAFF HIVES.

I have lost but 4 out of 50. Four were put in cellar; lost two; 4 were packed in chaff on their summer stands; lost two; all very strong, and will want GLEANINGS to help me take care of them.

J. H. WAGNER.

Hudson, Steuben Co., Ind., Mar. 19, 1883.

I see ½-lb. sections are fashionable. Just put a hypothenuse in 4¼ sections, and you will make two three-cornered sections, and they are so perfect a brace that they will stand throwing at rabbits, in a pinch, after bees propolize them, and they exactly fill your surplus supers.

J. W. CLARK.

Moniteau, Moniteau Co., Mo., Mar. 24, 1883.

## BEE-CAVES.

I have to blast into the caves here to get honey and bees to start with, but haven't much time for it, as it takes some time to drill into the rock so as to put in the blast; so I am going to try to have my bees at home, where I can attend to them easier.

W. S. STONER.

Bullhead, Edwards Co., Tex., March 3, 1883.

I have 22 acres in fruit of every description, besides hundreds of varieties of shrubs, roses, etc. I think it would pay me to have a few bees; and as soon as I can spare the money, I will make a start; but I am fearful about the result, as I know no more about bees than a hog does about Sunday.

SAM. MARSHALL.

Ladonia, Texas, March 26, 1883.

## BEE-SMOKERS AS VERMIN EXTERMINATORS.

I have just received two smokers for my small apiary, and for one of my neighbors, and still two other neighbors wish me to send for them to use with tobacco in them, to kill vermin on their house-plants. For this they are a perfect success.

GEORGE PATTEE.

Ackley, Ia., March 5, 1883.

## FRIEND BANNON'S NEIGHBORHOOD.

My bees are in very bad shape. I have not time to attend to them; if I had the time, I think I could get lots of honey. There are men here who keep bees, and have lots of time to attend to them; but they were "born tired;" they are loafers, and don't have to work. I would just like to have time to try my hand this summer.

JAMES BANNON.

Archie, Venango Co., Pa., Apr., 1883.

## HONEY VINEGAR; HOW TO MAKE.

To R. J. Fox, Natick, Mass. To make honey vinegar, we rinse our cappings after they have drained; also broken combs that contain honey; settle well; then drain carefully. Then place it where it is warm. It will not pay to take nice honey for vinegar; it will take 3 lbs. to the gallon for a good article that will not dye the washings of all your implements that have honey in. Waste nothing. D. L. BULAR.

Wauseon, Fulton Co., O., April 2, 1883.

## DO BEES GATHER BOTH HONEY AND POLLEN AT THE SAME TRIP?

I am convinced that bees carry honey and pollen at the same time. I was in our orchard the other day, and saw the bees, after they had got a load of pollen, boring their bills down into the peach-bloom until they were filled with honey, and off they would go to their hive.

J. E. THARP, JR.

Eagle Mills, Iredell Co., N. C., April 9, 1883.

## HONEY FROM TOBACCO.

As the frost was late last fall in coming, tobacco-suckers nearly all bloomed, and the way the bees went for them was a caution, and it was good honey for fall honey; but then, you are so opposed to the stuff, I don't believe you would hardly like it; but I will agree with you this far: I don't hardly think it would pay to raise tobacco just for the honey, though I have good reason to believe my bees got considerable honey from it this fall.

GEO. W. STITES.

Spring Station, Ind., Dec. 25, 1882.

## SCRAPING WIRED FRAMES (PAGE 137, MARCH NO.)

I gauge the top and bottom-bar; then I can make the holes for wire in the middle of the frame. The wires are drawn in gauge-mark, and tight, to spring up bottom-bar, which is thinner than top-bar. There is no touching the wire with the scraper, should the bees soil the frames in winter and need scraping.

J. LEWELLING.

Spiceland, Henry Co., Ind., Mar. 3, 1883.

[Thank you, friend L. Your plan is so simple I am ashamed to think we never thought of it before. One of our 5-cent gauges will draw a line sufficiently deep, without any trouble.]

## BEE GLOVES OF STARCHED LINEN, ETC.

How will those starched linen gloves work when the thermometer is about 90 in the shade? If the sweat runs off from the person who wears them as it does from me when I take off honey, I rather think a sting would go through; but I find no use for gloves, except in transferring, as a good smoke, and plenty of honey coming in, is the best preventive I know of for stings.

J. H. MYERS.

Saratoga Springs, N. Y., March, 1883.

[I quite agree with you, friend M., only "a little more so." If I wanted to hire a bee keeper, and he went to work with gloves on, I am afraid I shouldn't have a very high opinion of his ability.]

## SEEDLING BASSWOODS.

You spoke last spring of getting a quantity of H. M. Morris' seedling basswood-trees. Did you get them? And if so, how did they succeed?

## WATER FOR BEES.

You say in last GLEANINGS that honey seems to contain water enough for bees, and yet they sometimes die without more. Probably if perfectly healthy they will be all right; but if diseased a little, and feverish, then they need more. Don't you think so?

BURDETT HASSETT.

Howard Center, Iowa, Mar. 10, 1883.

[All the seedling basswoods that friend Morris could spare were sent directly to customers to fill orders. So we didn't try any. Will those who tried them please report?—Perhaps you are right about the honey, that it contains water enough for bees in a state of health, but that they need more when confined to the hive by weather, or when out of health from other causes.]

## Our Homes.

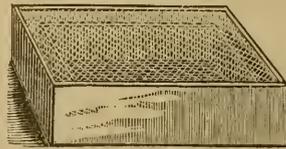

If ye then, being evil, know how to give good gifts unto your children, how much more shall your Father which is in heaven give good things to them that ask him?—*MATT. 7: 11.*

**J**UST at this season of the year it is often desirable to build up a colony of bees by feeding. I wonder how many of the friends know how to do this, so that your pains and feed may not prove a mistaken kindness. The novice, in his attempt to feed, will often only get stung for his pains, and then not succeed in getting the bees to take the feed at all. After he gets them to understand that it is food he wishes to give them, if he gives them too much, or gives it in a careless way, they may let it run out of the hive, and start robbing, and thus prove the ruin of the colony, instead of a help, as he intended it. Even if he does not do this, he may give them so much at one dose that they get demoralized, and forget to keep sentinels posted, as usual, and robbers push their way in, and the result is as before. Instead of making the colony thrive and prosper, it is only led into war and discord, may be the loss of the queen, and ruin. If he feeds heavily when the weather is to cool for them to fly, they are often incited to fly out when they ought not, and so the bees that are lost amount to more than the extra brood raised. Well, suppose he does not feed too much or too fast, or during unsuitable weather, but keeps a regular rate of feeding, but from a feeder so small that they get it only about as fast as it is brought in from the fields in the natural way, will he succeed then? He may not get very good results, even then; for the bees often get a habit of hanging around the feeders all day long, without going out into the fields, as would other colonies not fed, and so a sort of laziness and idleness is sometimes fostered that defeats the very object of the feeding; and this has been the case so many times that some of our prominent bee-men have declared feeding to be, in the long run, more of a damage than a benefit.

Although I have given the above as an illustration, and to bring out a truth, it is none the less true in regard to bees and feeding. Before dropping the bees, and going on with my Home Talks to-day, it may be well to add that, to avoid these difficulties in feeding bees, I would, as a rule, feed them only during weather that permits them to fly daily (and, in fact, I would not feed at any other time, if I could avoid it); and I would feed them just at dusk, and give them only so much as they could take up without fail, before morning. They will then go to work next day, nearly the same as a colony not fed at all, and in some cases much better; and if the work is done judiciously, by watching the state of affairs in the hive closely, the colony may be built up so as to have an enormous force of bees ready for work, by the time honey is to be found in the fields. Some of the largest results ever attained with a single colony have been brought about by this kind of intelligent manage-

ment. You see, the very heart and soul of the bee-keeper must be in the work, and then he can make the bees do almost any thing he wishes them to do. Shall we now drop the bees for a little while?

Is it really true that we take many of the gifts God gives us, about as the bees sometimes take their feed? How many of you have been stung when trying to feed the bees, and at a time they need it sadly too? Come to think of it, I don't believe I am yet quite ready to drop the bees in the way of illustration, after all. Last fall a good bee-friend came to see us, who lives in New Philadelphia, O. He brought along with him a small bee-feeder that his little boy was very anxious Mr. Root should see. You see, the father was a stone-mason, and had to be much away from home, and the work of feeding devolved on the boy. The way he fed was to have a little wooden box set in the upper story of the hive; and when it got empty, the boy was to go around, raise the covers of the hives, and fill up the feeders. I presume many of you know how it was. All the gratitude the bees showed him for his kindness in giving them the food that was to save them from death by starvation was to sting him most unmercifully every time he came near them. It was really too bad, wasn't it, "Bub"? No wonder he cried. I believe I should have cried too when I was his age. Come to think of it, it was too bad. I wonder if any of the rest of my little friends have ever had any such like troubles. If they have, I can not wonder so much that so many of them say in their little letters, they "like honey, but don't like to get stung." Well, you know necessity is the mother of invention, and so our poor little friend whose pa was gone, feeling the responsibility of the apiary resting on his little shoulders, wiped his eyes and went and invented a bee-feeder. I will give you a cut of it below.

THE BOY'S BEE-FEEDER.

It is, as you see, only a large box, without top or bottom, except a top of wire cloth; and when this was placed over the little wooden box, our young friend could pour the feed right through the wire cloth, close up the hive, and not a bee come out to worry or trouble him. Of course, a hole had to be cut in the quilt or honey-board, to set these boxes over, or into, and then it was complete, and my little friend was so delighted with the result he wished his father to be very particular to carry one to me, and explain it fully.

Well, is it not true that God often sends us blessings which we in our want of faith and trust in him receive much as the bees received their feed? Is it not likely, too, that he would be many times glad to send us greater blessings, if he could do it without doing us harm instead of good? We all have

an idea of what we think would conduce to our happiness; but are we sure our judgment is good in the matter? Look around you and see if it would be safe to give everybody all they are striving for. Do you see how many there are who want things that would be almost certain to bring them unhappiness? Well, have you an idea you are an exception to the general rule? About an hour ago I asked the boys and girls at the noon service what it was we needed most to-day. One of the girls replied, "Patience." The foreman of the saw-room whispered so that Mr. Gray heard him, "Dry sections." At this the foreman of the packing-room suggested faintly that we needed "some chaff hives." Then one of the printers said we needed some paper in the press-room, to print GLEANINGS ON. I was glad to hear that all seemed most intent on the wherewith to make progress in the work that lay before them, and that their interest was my interest; or, in other words, that they might serve their fellow-men in a way that would be acceptable in God's sight. Reader, what do you need most now? Is it something for your own gratification, or something that might help you in your great work of serving humanity? Did you ever think the word servant was a pleasant word? It is a happy word to me. Jesus, my beloved master, was a servant, and therefore I feel it a great honor to serve, even in my own humble way. Well, most of us have an *idea* of what it is we need; but only God the Father *knows* exactly what we need. Are we willing to trust him? Are we satisfied he is studying our wants and best interests, just as a kind father studies the best interests of his children? Ernest is now home from college, broken down in health. We are discussing sending him on a visit among bee-keepers; and if he makes you a call, you will know why he came. We wish to have him get well and strong, that he may be a good and faithful servant; not a servant to his parents, but a servant of the bee-keepers of the world, and humanity in general; or, if you choose, a servant of God. We do not expect him to grow strong by having an easy time, nor does God expect you to grow strong by having an easy time always. Instead of sending Ernest to Florida, we have suggested to him the frosts of Canada, and a visit to our stout and sturdy old hero, D. A. Jones.

The question that tries our faith seems to be, Does God really notice all the little events of our lives? Is he like a kind father, watching and studying us with our wants and needs? In this matter of serving that I have been speaking of, most of us are averse to being called servants. Quite often have people asked me if I supposed any of the women in my employ would be willing to do housework. After thinking of the matter a while, I usually told them that I rather thought they would not. Now, I don't propose to discuss the matter here, of how competent help can be obtained for household tasks, but I have been thinking it is not the girls alone, but mankind in general, who dislike the idea of being considered a servant; and yet the word when taken in the right sense, is a glorious one. The life of

our Savior was one of continued service; and if we are to be followers of him, we too must serve; and God's plan seems to be to make us strong and good by requiring service at our hands, and continued services.

Last Sabbath our pastor spoke to us about the ladder of Jacob's dream; a ladder that started from earth, and that reached up to heaven. He said, that with most of us our lives might be considered ladders in one sense. We are all anxious to climb; that is, we wish to grow wiser and better as we grow older. We wish to do something in this world. Well, friends, is it not true, also, that God wishes us to do something? He wishes us to grow in every thing that is good and pure, noble and true. It seems to be his wish that we shall grow better and better, serving others rather than ourselves. Jesus once told his disciples, you know, that if any one would be greatest among them, he should be their servant. Now, is it not true that our greatest trials and difficulties in life come from our being unwilling servants? If we could have the faith to believe that God is always watching us, and watching us lovingly, could we not take up with the necessary duties that lie before us, with a better grace than we often do? He knows full well that these duties are often grievous, and hard to bear; but his wish is that we should come to him. How often he has said, in substance, "Come unto me, all ye that are weary and heavy laden?"

A few days ago I saw a little child playing with her blocks. She was piling them up, and standing on them. Her father told her she would fall. She didn't heed him, however; but pretty soon, down she went, with a tumble, and was evidently hurt. "There, I told you so," said he; "next time you must mind what I say." It was evident from the looks of her face that she was ready to cry; but with a determined effort she held back the tears, although her little face showed plainly the evidence of pain. What did she do? I will tell you. She scampered as fast as her little feet would carry her in the direction of where she knew her mother was, threw herself vehemently into her mother's lap, and that soothed the pain. Did she do well? To be sure, she did. In the same way God would always have us come to him. No matter if we have been disobedient and headstrong. When we get into trouble, no matter how the trouble came, our duty is to come to him, trouble and all, and lay it at his feet.

Now, when we look about us in the world we see many things that seem to contradict the idea that all things shall work together for good; and, in fact, the Bible does not promise that all things shall work together for good. The promise is only to those who love God. The most important,—perhaps I might say the only important thing in life,—is that we should love God. Don't you remember the text, "Seek ye first the kingdom of God and his righteousness, and all these things shall be added"? Of course, all these promises can not refer to a bad man, or even to a selfish man. They are only to those who seek to have their hearts and their whole lives right before God.

Those who, although they make blunders, are constantly looking to God for guidance, also hold themselves in readiness every minute to *obey* the very minute he may call or direct. We find in history, not only sacred but profane, that men are made great by trials. Joseph, you will remember, had a regular series of calamities, or whatever you would call them; yet we, with the story right before us, have no difficulty in seeing that these great trials were right, and working for his good; or, what is still more important, for the good of the people. Joseph was a cheerful, willing, patient, and obedient servant. His only wish in life was to please God. Again, we see the same thing illustrated in the life of David. In his boyhood he was all that one could admire; yet God wisely saw best to send him trials, and great trials.

The proof of David's greatness is, that he bore those trials so uncomplainingly; that although bound down with cares and sorrow and trouble and great burdens, he raised his heart to God, and looked to him, and *trusted* him through it all. Now, friends, the measure of our greatness is in our ability to bear trials, and still trust God. While saying this I would again call attention to my remarks of last month, to the effect that our troubles are of two kinds: The one kind that we bring on us by our own sinfulness, or, if you choose, our own foolishness. From the former we have nothing to fear, because our Savior has promised to stand between us and all harm from all such causes. From the latter we have every thing to fear; but even in troubles of this kind we have this to cheer us—God is always willing to forgive those who are truly penitent.

Another point comes in here: During the time of Joseph, David, and Paul, both civilization as well as true religion were at a low state. Persecution was the rule, and good, strong, faithful Christians were not scattered through every community, to come forward bravely and valiantly to take the part of those who were suffering for Christ's sake, as is the case nowadays. I have talked to you before about those who have much to say about a hard, grasping, unfeeling, and ungrateful world. My friends, it is not so. The world is not hard and unfeeling. We can rejoice that it is rather the other way. Willing, faithful servants of Christ, our Lord and Master, are found on every hand. If you have met with nothing but abuse from the world, it is surely because you have been selfish and abusive yourself. Through humanity you should see God; and if you have never seen the image of the Savior, it is because your heart is perverse and wicked. Many of you who read these pages know my past history pretty well. You know my trials and difficulties, as well as my joys and successes. Many of the trials have come through my own perversity. Perhaps some of them have been sent by the loving Savior because he would have me grow wise and strong. New trials are coming now, it would seem. How shall I bear them? If my heart is wicked, and my plans are selfish ones, the end will surely be failure,

and perhaps ruin. If, in my own peculiar way, I have been trying to serve God and my fellow-men, and am still trying so to do, no great harm or calamity will come. If my purpose is right in God's sight, it will also be right in the eyes of all good men and women, and friends will not be lacking. Did you ever think of this? You will always have friends, and plenty of them, when you deserve them. When you don't have friends, and good, faithful ones in abundance, the probability is, it is because you, by your own foolish acts, have forfeited all right to them. In this way it is, I think, that the promise is, in a measure, fulfilled, that all things shall work together for good to those that love God. Is it not a happy thought, friends, that we are not only to have God with us, the love of a Savior, but that we are to have earthly friends with us, even at our last moments? Human sympathy and companionship, how much is it worth! Have you ever felt the need of it, dear friends? Have you ever seen the time when you could feel thoroughly what it is to have somebody come and stand beside you and say,—

Whether thou goest, I will go; and where thou lodgest, I will lodge: thy people shall be my people, and thy God my God?

A lawyer once said to me, that the best man in the community might have circumstances so much against him as to cause his arrest, and that he might even be put in prison when perfectly innocent. I can hardly think this possible in the present state of society. We all know people, at least I hope we do, whom it would be almost impossible to arrest, no matter what the circumstances might be, for the simple reason that public opinion would stand between them and any charge that could be made. Are you one of these people? If not, could you not be one?

One of our young bee-keepers has something that comes in here so well with what I have been saying that I wish to give it here:—

Success is no chance product, no fortuitous golden shower, but the natural issue of well-directed exertion. The admission of this principle is necessary to vindicate the character of successful men. Reason and Scripture alike, teach that a connection has been established by our Creator between the exercise of our faculties and the attainment of the various objects of human desires, and that industry, prudence, knowledge, and perseverance, have a certain definite value in the business of the world. What right has any one to say, "There is no use in my trying to be a successful bee-keeper, for I never get any profit, and it is all expense"? Now, are you sure that you have done your part? You may lack the all-important part, and that is perseverance, though this connection between the use of means and the attainment of success is not, when properly viewed, inconsistent with the doctrine of Holy Writ, which teaches us that God sometimes, for wise and special purposes, disappoints our best efforts. All the events of time are made subservient to the ends of a moral government. The race is not always to the swift, nor the battle to the strong. In order to try our faith, wean us from an undue attachment to temporal things, and purify our hearts for hallowed

communion with himself, God sometimes sees fit to blight our fairest prospects, and disappoint our most fondly cherished hopes; but he never takes such measures except to promote our real welfare, and they still leave in full force the rule which also is found upon the inspired pages, "The hand of the diligent maketh rich; but the drunkard and the glutton shall come to poverty." So I find we can realize success by trying to imitate men who are successful. To a reflecting mind, this will be no slight benefit. There is, unquestionably, an art in "getting on;" there are certain qualities, mental and moral, which render success with the divine blessings much more likely than otherwise: hence whoever wishes to succeed must first become a learner. Nothing is so dangerous to him as self-confidence. Docility, a willingness to learn his defeats, and be taught by the experience of others, are more valuable to the young bee-keeper than any thing that he can possibly take in. Never try to imitate the indolent, but always strive to be in the front rank with successful men; and if you can not be successful over a few things, how could you control many things? "So run that ye may obtain."

J. H. BURRAGE.

Concord, Cabarrus Co., N. C., April, 1883.

There is one especial word in friend B.'s remarks that I would call attention to; and especially would I emphasize the word "docility." What God wants is docile Christians; not those full of self-confidence and self-will, but those willing to be taught, and always ready to learn. Docility is not laziness, by any means, but quite the contrary; and when it is coupled with energy, and faith in God, success must follow.

## Jobacco Column.

A GOOD WORD FOR CAMP-MEETINGS.

SEE that you are giving a smoker to those who dissolve partnership with tobacco, so I thought if I was not too late you would send one to my father. He quit smoking one year ago last summer at a camp-meeting, and has not used it since.

FRED REMENDER.

Kilmanagh, Huron Co., Mich., March 19, 1883.

May God bless the camp-meetings, friend R., if that is the fruit of their work. When this kind of meetings cause people to give up their sins in a way plainly to be seen by the world, like the discontinuance of these bad habits, it is a very good evidence of their being the work of God. "By their fruits ye shall know them."

Send me a sun-glass to light my pipe. You see that I smoke; and as it is one of the few pleasures I have, I don't think I ought to stop while I do not use it to excess.

J. W. CORBETT.

Bennettsville, Marlborough Co., S. C., Mar. 16, 1883.

Well, it seems to me, friend C., that this is a little cool all around. Do you suppose that I sell sun-glasses, with the idea that they might be handy to light pipes with? I intended them as a sort of philosophical toy for the juveniles. But if they are going to be used for the purpose you mention, I don't know but I shall have to take a second look at the matter. Accord-

ing to your reasoning, we may expect you to stop when you get to using tobacco to excess. Now, candidly, do you think that is the way they generally do? Is not your reasoning a little "thin," to use a common expression? If I were you, I think I would stop *before* I got where you speak of getting. We are good friends all the same, are we not, friend C.?

I have tried so frequently to quit off the "nasty" weed, and made a signal failure each time, that I have felt discouraged, and at times accused myself of extreme weakness and folly in not being able to master the habit; and now, friend Root, here's the Hon. Judge Jere. Black's experience, annexed, and—well, sir—it just boosts my opinion of my own weakness away up yonder into the nineties. Hear Judge Black (nearly everybody has heard of Judge Black):

WHY JUDGE BLACK USES THE WEED.

Not long ago Judge Black met a gentleman who pathetically related his endeavors to break himself of tobacco chewing, as it met with the unqualified condemnation of all civilized people. "You'll find it a hard case—a hard case, my friend," replied the Judge, with a solemn wink. "I tried to break myself of it once—didn't I ever tell you? Well, it was when I was Attorney-General, and I said to myself, 'Jeremiah Black, we've got to stop this thing.' So I made up my mind, and one morning I started down to my office without a scrap of tobacco. I began the day badly, and it got worse by degrees. I never felt so much like a savage in my life. I dismissed two clerks, bounced a messenger, made a fool of myself three or four times, snapped at everybody, and started home, feeling myself to be a total failure and all creation a mistake. On my way home I met a man whom I respected very much. I told him my experience with leaving off tobacco, and asked his advice. 'Judge,' he said, 'my experience is the same as yours. I tried to leave off too. I quarreled with several members of the church I belonged to, thought the minister was a fool, got tired of my wife, and if I had kept it up, I should have been a moral monster—and I determined to circumvent the old enemy by taking up my cherished vice,' and so," continued the Judge, cheerfully, "I saw that tobacco was conducive to virtue, and [putting a quid] I propose to keep it up until I leave it off."

Please give us your opinion now. Does this "settle it"?

R. C. TAYLOR.

Wilmington, N. C., April 13, 1883.

Friend T., I am very much obliged to you for your funny story; but the moral seems to be on the wrong side. But there may be a moral for the juveniles in it, after all. If it is such a very hard thing to break off from the use of tobacco, perhaps they will wisely conclude never to commence. But about yourself and Judge Black: Do you really feel good about giving way to a thing that you think you ought not to? I presume you remember Dr. Franklin's story about the speckled ax. I am very sorry to hear the Judge's neighbor had so much trouble. Quarreling with the members in the church was not so very bad a matter; for if they were good followers of the Master, they would forgive him. Nor would it do so very much harm if he did get to thinking the minister was a fool; for ministers are used to such things (begging their pardon), and it doesn't hurt them. But getting tired of his wife is something a little more serious. However, if it lasted only for a day or two, I suppose even that could be gotten over, especially as she, good soul, would know all about his infirmity. Come to sum it all up, friend T., I believe I should advise you to push ahead, after all; especially as it would take you, but a few weeks to get through the "Slough of Despond," and come out on the brighter and happier shore. May God help you, and all of the friends who feel themselves in any such bondage. "Of whom a man is overcome, of the same is he brought in bondage."

## GLEANINGS IN BEE CULTURE.

A. I. ROOT,  
EDITOR AND PUBLISHER,  
MEDINA, O.

TERMS: \$1.00 PER YEAR, POST-PAID.

FOR CLUBBING RATES, SEE FIRST PAGE  
OF READING MATTER.

MEDINA, MAY 1, 1888.

But unto you that fear my name shall the Sun of righteousness arise with healing in his wings. — MAL. 4:2.

We are out of the sea-shells we had on the 5 and 10 ct. counter, and don't know where to find any more. Can anybody who reads GLEANINGS furnish them for us? You will see by our price list the dimensions and prices of those we had.

The old Quinby smokers we advertised in the last JUVENILE are all gone; but we have quite a number of discarded smokers of various makes that we can sell you for 25 cts. each, but the postage on them will be 25 cts. more. Perhaps these latter, if you want them, had better be sent with other goods by freight or express.

SOME of the friends are already sending queens without any card with them to tell what they are, or whom they are from. Whenever you send a queen, send a postal card in the same mail, or one mail before it. Unless you do this, I shall have to refuse to be responsible for them. You see, we want to dispose of them within one hour after they are received, if possible.

### MISREPRESENTATIONS IN PRICE LIST.

In spite of the best we can do, our price list is sometimes misleading. One reason of this is, perhaps, because we are so cramped for room, and the description must necessarily be brief. Dear friends, we do not wish this to be so, and should be very sorry to mislead anybody, even though we are anxious to sell our goods; and we shall be thankful to have any of you tell us wherein our price list may mislead, and we promise you it shall be corrected promptly, so far as lies in our power.

### STARTERS OF FRESH COMB.

ALTHOUGH some trouble to do so, I think it will pay those who have time, to prepare their starters of new comb exclusively; and I should not be surprised if they would find it as Mr. House says on p. 217, especially if the result proved that they could see a whole colony that had been hived in the morning at work in all the sections in the afternoon. In fact, I am not at all surprised at his yield after knowing he paid so much attention to just these two ideas. Now let us see who will profit by these seasonable hints.

WILL you pardon me, my friends, if I ask you once more to call goods by the same names they are called in the price list? Some of you are very bad in this matter. A friend, a few days ago, made an order for "frame straps." Now, what do you suppose he meant? After a good deal of "ciphering" all around, we made out that the man wanted *separators*! Cases almost similar are coming up almost constantly; and when our poor clerks don't happen to hit it, our friends sometimes write back "awfully." Lest the latter might give you a wrong im-

pression, I want to say that, as a rule, our customers have been very kind and considerate. It is only a few who get angry, and say that my business practices do not agree with the teachings in the Home Papers.

EVERY little while somebody asks for carpet-tacks from our counter. Well, while Mrs. Root was putting down her new carpets I made her tell what kind of tacks were best. She says she wants them blue, and not tinned. She also wants the heads round, so they won't pull off when they are to be drawn out of the hard boards. And she wants them good and stout so they will hold. We have had some manufactured to order on purpose, and can furnish them for 5 cts. per oz., or 10 cts. per pound. There are about 50 tacks in an oz. If wanted by mail, add 2 cts. per oz., or 18 cts. per pound.

UNTIL further notice we will still pay 35 cts. cash for good wax, or 37 cts. in trade. Please remember, friends, what I have said about sending wax by express. Last evening we got a small box of 5½ lbs. by express, on which the charges were \$1.05; so you see our friend had to lose over half of his wax in payment of the express charges. Another friend sent us some wax by mail to pay his subscription to GLEANINGS. The wax amounted to over a dollar, but the postage on it was 54 cts. Had he sent us the 54 cts. in stamps, he would have had his GLEANINGS for over six months, and his wax too.

### PUT ON YOUR COUNTY.

MY friends, do you know that every letter that leaves our office (unless it be directed to some large city) has the name of your county written in the address? I have been thinking that if you did know it, and that every time you neglect to give us your county, the clerk who *should* be busily answering your question has to stop all other work to hunt up your place of residence, that you would at least be a little more thoughtful. For although it seems a trifling matter, it assumes quite large proportions in answering 150 or 200 letters a day, and costs us not only lots of patience, but, in the course of a year, a considerable sum of money.

IN another column our good friend Mrs. Axtell seems to be borrowing trouble for fear I have given her name a little too much prominence. Why, bless your heart, Mrs. A., we all know how it is, and I don't believe any reader of GLEANINGS ever for a moment thought you meant to take more than your share of the work which you and your good husband have done. God has given you an especial talent for telling your brothers and sisters how you do things, and we think you have improved that talent well. You could never have managed the bees without your husband, and I believe it is equally true he could never have made the success you two have, did he have it all to do alone; and he certainly would not have had time to tell it to us all in the pleasant way you have done. "And they twain shall be one flesh."—MATT. 19:5.

### CHANGES IN PRICES.

THIS season has perhaps been the worst for advance in prices (alsike clover and fdn., for instance) of any previous one; and while most of the friends have taken into consideration the state of affairs, and have paid the advance without complaining, a few have been very much displeased, and one or two quite bitter and abusive. Bear in mind, friends,

that I am in no way responsible for the sudden rise in the value of such things; neither is it in my power to avoid it. I should be very glad indeed to give you the same goods at the same prices, year after year, without any change, but it is not possible. Bear in mind that we say in our price list, in two places, that all goods are *subject to changes in prices without notice*.

OUR engraver failed to get a good picture of friend Muth, and so he will try again for next month.

OUR basswood is now in nice order for sections; but I tell you, the demand for them is keeping our machines "a buzzing," sure.

DID you ever! We have received 530 new subscribers during the month of April, and GLEANINGS now stands 5508, which is higher than it ever stood before.

UNTIL further notice, the price we pay for dollar queens will be 90 cts. each, and we shall sell them for \$1.50. We have now a nice stock on hand, ready to be shipped by return mail.

#### DZIERZON'S RATIONAL BEE-KEEPING.

MR. NEWMAN has kindly sent us a work entitled "Rational Bee-keeping," by our old father Dzierzon, the originator of the theory bearing his name. The author is not only a thoroughly scientific bee-keeper, but a naturalist. He has probably made greater strides in scientific apiculture than any one man. His book contains his many discoveries, together with his valuable experience and research. In addition to this are foot-notes by C. N. Abbott, the former editor of the *British Bee Journal*. We thus have the opportunity of direct comparison and verification. As regards the nature, the distinctive characteristics and explanation of some of the peculiar phenomena noticed in bees, the book seems to stand among the foremost, if not in the front ranks. I hardly think the implements of the apiary would be at all suited to American bee-keepers; but as for real scientific value, it would well repay any bee-keeper whose attention is at all inclined to scientific research, to purchase a copy. It contains 350 pages, fully illustrated. We can mail it to any address for two dollars.

#### STEEL GOODS; RUST AND FROST.

BE careful how you rub your fingers on bright finished steel goods, especially if they are to be put away unused after being so handled. Machinery is usually oiled when ready to ship, but not always. Another thing: Be careful about unpacking steel goods or cutlery in a warm room, after they have been shipped during cold frosty weather. You see, the air we breathe is something like a sponge, and will suck up and hold lots of water. Now bear in mind, that the warmer the air is, the more water it will hold. All right; now, then, if we have a room full of warm air, fully charged with water, it will have to let go of some of this water, if we cool it suddenly. Now you see why iron or steel gets wet, and rusts, if we bring it into a warm room, when it is icy cold. We say it "sweats," when it is nothing but just what I have told you.

*Moral.*—Do not unpack fine steel goods that are icy cold, in a warm room. Unpack them in a cold room, and let them warm up gradually. Great injury has been done to valuable cutlery by not keeping this in mind.

#### MAT FOR COVERING THE FRAMES.

NO bee should ever be allowed to get up under the cover of a Simplicity hive. The wood mat, enameled sheet, or the burlap sheet, whichever be used, should always fit bee-tight. Now, a beginner would be quite likely to think this a very troublesome process, and, in truth, it is a little troublesome to fit a mat or sheet down the first time it is used. But be not discouraged, friends. Take a little time to press it down nicely all around the edges and corners the first time you put it over the bees, and you will find that the next time you come to open the hive it will stay in its place nicely without any trouble. Furthermore, the bees will very soon wax it all around the edges, so that in opening the hive you need only to pull it loose from the attachments, except one side, and this side answers as a sort of hinge to make it come in place; and when replaced it should always be put back in the same position. Now, then, when I come to see you, don't let me ever find a hive where the cover is waxed down, and comes off with a snap, because you have at some time or other allowed the bees to get up under the cover.

#### TO OUR PATRONS.

THE flood of orders at present seems to be almost beyond our ability to fill. Now the question comes up, if somebody has got to be delayed, or go without his goods, who among you shall it be? As we can almost fill three or four orders for regular goods while we are fussing with one order for odd-sized hives or sections, it would seem to be our duty to decline any orders for the present, other than for the regular goods described in our catalogue. Secondly, as we regard it almost a sacred duty to wait on those who have sent the *money* with their orders, is it any more than justice that orders accompanied by cash should have preference? You know, friends, that where a man sends money he has a right to complain in a way that one who has not sent us money can not consistently do. In saying this I take into account that we have many old and tried friends who always send us the money when we express a wish for it, and whose word *is* money; but even then, where the cash has been some little time in our hands, does it not make a difference?

Now in regard to discounts. As a rule we make no discounts to anybody, aside from those given in our price list. If anybody wants to get goods at the 10 rate, he must order 10. The only exception we have made to this is where somebody takes the pains to get an order from his neighbor. In such cases we have generally allowed a discount of 5%; but on some goods we handle, our prices are so very close we find it almost impossible to do this without loss. We will do the very best we can, dear friends; but if that should not be satisfactory, we will promise to return your money promptly the very moment you ask for it. As I told you a short time ago, mail orders, and orders for goods by express, go (with but few exceptions) the day the order is received, or the next day at the furthest. It is orders by freight, calling for a great variety of goods, that we have to delay; and many times we could send these off promptly, if you will add, in closing your order, "Send us what you can of these at once, and the rest when I order again." Where you are sending us orders every few weeks, this plan may answer very well; but where you want your goods to come all in one lump to save freight charges, it becomes a little more difficult.

THE NEW IMPROVED  
STEAM POWER  
**Comb Foundation Factory.**  
**CHAS. OLM, Proprietor,**  
FOND DU LAC, WISCONSIN.  
THE BEST WORK AND LOWEST PRICE.

**CARY'S ANNUAL CATALOGUE OF  
BEES AND SUPPLIES FOR 1883  
IS NOW READY.**  
You should read it before making your purchases for the season. We offer you goods of very best quality, at very low prices. If you do not believe it, read our prices and send for a sample order.  
Address WM. W. CARY & SON,  
2tfd Colerain, Franklin Co., Mass.

**CHOICE ITALIAN QUEENS** from best strains obtainable. Safe arrival guaranteed. References given when desired. For prices, etc., see March GLEANINGS. C. M. GOODSPEED,  
4d Thorn Hill, Onondaga Co., N. Y.

**100**  
Colonies of PURE ITALIAN BEES for sale cheap. Queens all bred from imported mothers. Send for circular. C. C. VAUGHN, Columbia, Tenn. 4-5

**FOR SALE!**  
200 or 300 colonies of Italian Bees in Langstroth hives in good condition. Price, single colony, \$6.50; 10 or more, \$6.00 per colony. Hybrids, 50 cts. less. I will guarantee safe arrival.  
4-5d C. GRIMM, Jefferson, Wis.

**HOLY - LAND**  
AND  
**CYPRIAN QUEENS**  
AND  
**Farm Implements!**

I have a fine lot of pure Holy-Land and Cyprian queens which I will sell for one-fourth more than Root sells his Italians. Also a few pure Albinos; they are light-colored, and very gentle.  
I keep on hand, and can ship from the factories where made, a stock of Farm Implements, a two-horse corn-planter, with drill attachment; one-horse corn-drills that will plant in hills; a steel-toothed harrow in three sections, with lever to clear from trash, or pass over obstacles; spring-tooth harrows; common harrows, with 40 or 50 teeth; sulkey hay-rakes; sulkey cultivators, plow-sulkeys, etc. Send for Circular. tf  
H. B. HARRINGTON, Medina, O.

THE  
**British Bee Journal.**  
The British Bee Journal is now mailed to our address in packages, each month. In order to dispose of them, we offer them at present at \$1.00 per year, postage paid, beginning Jan., 1883. Will guarantee safe arrival of every number.  
A. I. ROOT, Medina, Ohio.

**CONTRACTS WANTED**  
WITH  
**SUPPLY DEALERS,**  
Dealers, and those who contemplate becoming such, are requested to write for estimates on job lots of hives, sections, etc. We make specialties of chaff and Simplicity hives, but will make other styles, if unpatented, and ordered in considerable quantities. Let us know the kind and probable quantity of goods you expect to handle, as well as any other information you may deem necessary, and we will send you prices that we are confident will be satisfactory.  
10tfd S. C. & J. P. WATTS,  
LUMBER CITY, CLEARFIELD CO., PA.

**PATENT FDN. MILLS.** 6-inch, \$10.00.  
2tfd 10-inch, \$15.00.

# THE BEE-KEEPERS' HANDY BOOK;

OR,

## TWENTY-TWO YEARS' EXPERIENCE IN QUEEN-REARING.

In Paper, \$1.00 Per Copy; In Cloth, Handsomely Bound, \$1.25.

### OPINIONS OF EMINENT APIARISTS OF ITS VALUE.

*From Geo. W. House, Fayetteville, N. Y.*

The information gained by a careful study of the new method of queen-rearing I consider worth one hundred dollars to me. It supplies a long-felt want to every queen-breeder and dealer, and is invaluable to every bee-keeper.

*From James T. Norton, Winsted, Conn.*

I have read the book with much satisfaction and profit; it is written concisely, and to the point; should be in the hands of every bee-keeper.

*From Rev. D. D. Marsh, Georgetown, Mass.*

Your book on queen-rearing has been received. I am very much pleased with it. It is refreshing to see how frankly you have divulged the hard-earned secrets of your long experience. Your book contains a great deal of that information which those who have already taken the "first lessons" in apiculture will find new and valuable.

It will be remembered that Mr. E. T. Flanagan, of Belleville, Ill., went to Kenner, La., in March last to rear early queens. After receiving the book he wrote me thus: "I would have cheerfully given \$50.00 to have had your book and apparatus here when I first came. I am raising 300 queens.

*From L. C. Root, Mohawk, New York, one of the most prominent apiarists in America.*

"Your book has been received. Its title, "Twenty-

ty-two Years' Experience in Queen-Rearing," is enough to convince every bee-keeper that they can not afford to be without it. Good queens is the rock upon which bee-keeping rests. I predict a large sale for the work."

*From J. M. Hicks, Editor of Bee-Department, American Grange Bulletin. Mr. Hicks is well known to nearly all bee-keepers in the West.*

"Book received. I pronounce it the best work of the kind of American publication. I consider it a perfect gem for the practical bee-keeper, and should be in the hands of every apiarist.

*From American Bee Journal, April 17, 1883.*

We are more than pleased with it, not only with its contents, but also with its typography and binding. It is a handsome octavo of 200 pages, with 20 illustrations. This is one of the subjects upon which more light has been demanded by progressive apiculture, and we are glad to welcome the work of Mr. Alley on the subject, because he is a successful and experienced queen-rearer, and he gives details of the methods he now practices after many experiments, covering a period of 22 years, during which time he has, perhaps, produced and reared more queens than any other breeder. This new work should be in the hands of every practical apiarist, and is worth many times its cost to any one having the management of bees.

Those who desire, may remit on receipt of book. Fractional parts of a dollar can be sent in postage-stamps. Our 22d Annual Circular and Price List of Queens for 1883 contains 32 pages, and is illustrated to show our new way of queen-rearing. Sent free. 5d

He that is faithful in that which is least, is faithful also in much.—LUKE 16: 10.

PUBLISHED BY A. I. ROOT, MEDINA, OHIO.

Vol. II.

MAY, 1883.

No. 2.

MYSELF AND MY NEIGHBORS.

WHO IS MY NEIGHBOR!—LUKE 10: 29.

**I** WONDER how many of the children to whom I am talking to-day are school-children. Most of you, I presume, are; at least, I hope so. Well, I used to go to school too; and the school I attended, about thirty years ago, was taught by a school-master who had a good deal of trouble in making his pupils mind. For instance, when they were disobedient he would sometimes ask them to come out and stand on the floor; but pretty soon they got so they were disobedient, even in this. Then he would come up to their desks where they sat, and make them come out on the floor, sometimes taking them by the collar. Well, some of the boys finally got so disobedient that they would hold on to their desks so he could not lead them out on the floor, and, I am sorry to say, that in some cases he had to give up and let them sit where they were, because he could not make them mind nor obey him. I wonder if they ever have any such work at your school, dear children. I trust not, now in this enlightened age of the world. Well, of course the directors began to think, after a while, that this would not do, so they hired another teacher. He was a fine-looking young fellow, rather tall, and there was also something about his look and manner that made the most of us think that he was not the one to be trifled with in the

way we had been doing. Among the pupils was a boy called Thomas. Thomas was by no means a bad boy, but he had been led into these kinds of tricks; and by some means or other it happened he was the first one to undertake to disobey the new master, in a flagrant manner. We had been carrying on a little too much that afternoon, and the new teacher asked Thomas to come out on the floor. At this, many of the boys began to watch intently to see whether the new master would do any better than the old one did. Thomas didn't go. The teacher spoke to him the second time. He didn't go then. At this the master came up near his seat and took hold of his collar; but Thomas got hold of the seat and bench, as had been the way of doing, and when the new teacher pulled pretty hard, and gradually relaxed his hold as though he thought of giving up, Thomas looked around to some of the rest of us and began to smile a little as though he thought he was rather more than a match for the master. I happened to be watching intently the face of this latter personage; and although he seemed calm and unruffled, yet I thought I caught something of a look in his eye that made me think he was not ready to give up just yet, after all. Of course, the eyes of all the school were turned upon them, when all at once, as if by a sleight-of-hand, the teacher raised Thomas bodily clear out of his seat, and over the desk, and he hardly touched any thing until he found himself in

the middle of the floor, on his back. Now, Thomas was always remarkable for his extreme care of his dress, and, in fact, every part of his clothing; and to be lying on the dirty floor on his back was to him humiliating in the extreme. He essayed to get up, but the master said, very quietly,—

“No, Thomas, I shall have you stay there until you can promise me to be a good boy, and obey orders when I give them.”

Thomas promised, and that was the end of attempting to disobey the master.

One of the next things I remember in regard to the new teacher was his coming along one day when I was fussing with a peculiar chemical apparatus. For the experiment I was making, I wanted a wooden box to hold water; and although I filled the cracks in my box with tar and cotton, and patched it up as boatmen often do leaky boats, it still bothered me in leaking. Said the new teacher, who was looking on,—

“Why, Amos, why don’t you make a box that won’t leak?”

I looked up at him and replied,—

“Can you make a box that won’t leak, without any tar on it?”

He said he thought he could, and pretty soon with some thin boards, and the aid of father’s old chest of carpenter’s tools, he cut out the boards and nailed up the box, and it was so nice a piece of work that even I had faith that it would hold water. Quite anxiously I inspected every crack and point when we poured water into it, and, sure enough, it *did* hold water; for not a drop ever came out of it. My friends, do you think you can make and nail up a box so well that it will hold water? Perhaps you had better try it.

Well, after the new master had made the pneumatic trough for me, for that is what I called it, he somehow got into the way of assisting me with a good many of my chemical experiments. He helped me make a little steam-engine out of an old kettle; and one evening after school we made a fire-balloon which, although it never went up very much, afforded us quite a good deal of fun. One remark the new master made about that time, was one I have long remembered. He told somebody (when I was out of hearing) that he would like no better fun than to do nothing else but “make things” for “that boy.” I used to show him my old book on chemistry, and by and by he used to spend considerable time at our house, and he and I began to be great friends; although I do remember just now that I once complained to mother that James didn’t seem to care very much about chemistry, after all. The reason that I made the remark was, that on that special evening he seemed to care more about talking with one of my grown-up sisters than he did listening to what I was trying to show him.

Years passed. The chemistry was somewhat forgotten; but my old disposition of wanting to pry into strange things about me, and learn all about things, had not left me. I was a man grown up, in business; yet as in my boyhood, I had many things I wanted made, and I wanted many things. Although I was unable to make them myself always,

people were at hand to make them for me. So I got into the way of employing a good many people. Among other things, I had learned, too, to know and love my Savior, and it had become a habit with both myself and wife to go to him for all the help we needed, of whatever kind. One evening, toward the opening of spring, I told my wife that my business accumulating on my hands was getting to be more than I could possibly stand. I told her that some one who was not only capable of taking charge of the work, but to take charge of the hands, was getting to be almost a necessity. As it was just before we were retiring for the night, I told her we would ask God to direct us in finding just such a one. We knelt and prayed God to guide me in the selection of such a one. As we arose, I told my wife that I could think of only just one man in the world who had the faculty of doing what I wanted done, but I didn’t think it would be possible to get him.

“Who is it?” said she.

The one of whom I was thinking was none other than my old schoolmaster, the man who could make a box that would “hold water,” and the man, also, who had the faculty of taking a disorderly school and bringing them into subjection without words or argument. In short, it was Mr. Gray of whom I was thinking. The next morning I wrote him a letter, and in due course of time he came to help me; and then the wish he expressed so many years before, came to pass. He has been now for years as “my neighbor,” making boxes for me that will “hold water,” helping me to bring order and beauty out of rough pine boards, and sometimes, also, perhaps, rough humanity.

I want to tell you just one more little incident about Mr. Gray, when he was a schoolmaster. As well as a day-school teacher, he was also a beautiful penman and writing-teacher, and so of course we soon had a writing-school started in our little town. Well, in the course of the winter another writing-teacher came there and started a writing-school. As is often the case, a little rivalry sprang up between the two teachers, and the new comer used Mr. Gray in a way that was any thing but gentlemanly. Now, while everybody expected to see Mr. Gray retaliate, and pay him back in his own coin, as the saying is, we were all very much surprised to see nothing but great kindness and friendliness shown in return. Even my sister got impatient with the master, because he would not show a “spark of spunk,” as she termed it. But James very quietly replied to her, “Eliza, I am sure my course is the best.” And so it proved eventually. During this same winter my eldest brother had a strong desire to go to a dancing-school. When parents and sisters had remonstrated, and, as it seemed, all in vain, James settled the question in this wise:—

“Look here, Marsh, you give up the dancing-school, and I will teach you drawing-lessons. Then you can go out and teach drawing and penmanship, and see something of the world.”

“Marsh” accepted the offer, and in due time astonished us all by becoming not only

a splendid penman, but of very great proficiency in ornamental penmanship and drawing, and did, in truth, go out into the world and teach both branches quite successfully.

Well, our factory where we are now doing business was built by Mr. Gray; and when he built it I protested almost all through because he and the masons would make every thing so massive, and with such strength; but strong as it was, the building is now creaking under its weight of merchandise; the floors are sinking, and the ceiling is cracking; and Mr. Gray says, as he looks it over, "Why, no wonder, Amos, your buildings break down. Whoever thought of loading every available spot with such piles and piles, and tons and tons of papers, books, machinery, goods, and traps of all sizes and shapes? Now, you just see if I don't make this next new building strong enough. I know what you want to do with it now." Isn't it a pleasant thing, children, to find people in the world who can do so many things you can't do? And is it not pleasant, also, to find that the very things that make us different from each other enable us at the same time to be so helpful to one another?

### VIRGIL'S TREATISE ON BEES.

*Continued.*

#### ALMOST TEMPTED TO WRITE A FIFTH GEORGIC ABOUT GARDENING.

**A**ND were I not about to furl the sail  
On the last quarter of my fourfold tale,  
Well toward conclusion coming even now,  
And turning to the land my hastening prow,  
Perchance rich gardens I would pause to sing,  
What cunning care doth forth their beauties bring;  
And the rose gardens blooming twice a year  
That by the city Pesti do appear;  
And how the endive thrives in Celtic rills,  
And how green banks the bee-sought parsley fills.  
Tangled among the growing herbs I'd tell  
How doth the cucumber his belly swell;  
All these I'd sing, nor would I words forbear  
How the late daffy dons his leafy hair;  
The bear's-foot, with its gentle bending bough,  
And ivy gray I would not disavow,  
Nor yet the myrtle, loving well to grow  
Along the banks where peaceful waters flow.

#### THE OLD MAN OF CILICIA.

For I remember, that in former hours  
Under Taranto's lofty southern towers  
I saw where its dark river dews the plain  
Just ripening with its fields of yellow grain  
An aged man from far Cilician strand (1)  
On a few acres of abandoned land:  
It was not fit for vines, too poor to plow,  
Its herbage would not feed a sheep or cow,  
And yet he made a garden 'mong the thorns  
Rare as the wealth and taste of kings adorns, (2)  
Planting verbenas and the poppies white,  
And the white lilies clad in snowy light.  
Though late at night returning, at his will  
With unbought feasts his tables he could fill. (3)  
He was the first to pluck the rose in spring  
And fruit in fall; and when as cruel king  
E'en winter reigned and rove the rocks with cold,

And did with ice the flow of streams withhold.  
The leafy hyacinth he cut e'en then,  
The summer zephyrs loath to come again.

#### THE OLD MAN'S SUCCESS WITH BEES.

Therefore this same old man was first to be  
Rich with young brood of bees, and first was he  
With many swarms, (4) and first from shivered combs  
To press the honey forth that stirs and foams; (5)  
And he had linden-trees, and also pine,  
Most fruitful of the pollen-dust benign.

#### UTILITY OF BEES IN FERTILIZING FLOWERS.

As clothed itself with flowers each fruitful tree  
So many fruits in autumn would there be. (6)  
He too transplanted far-grown elms in rows  
And pear-trees old, and even bearing sloes,  
And plane-trees large enough to yield a shade. (7)  
For things like these my space too small is made;  
I pass, and unto other pens resign  
The task of teaching thus in tuneful line.

(1) Paul the apostle was born in Cilicia, and the old man whom Virgil saw making such a success of gardening and bee-keeping was born in Cilicia too. Isn't it nice? The great Roman general Pompey made war on the Cilician people, took a lot of them prisoners, carried them away a thousand miles, and let them loose in the region about Taranto. You can easily find the place on your map. Italy is like a great boot, and the gulf of Taranto is the little gulf between the heel and the ball of the foot. Our nice old man seems to have been one of these captives.

(2) This is as good as "try, try again" for the little folks. Who's going to give up and say he can't do any thing in the world after this? Here is a man who is old, a prisoner, in a strange land, with no friends, no money, no any thing; but just see how he pitches in and succeeds. He "tackles on" to a piece of land that nobody would own because it was so worthless, makes a beautiful garden of it, and goes to keeping bees. God looked down approvingly from heaven, I think; at any rate, he sent the story of the old man's doings two thousand years down the ages, to teach resolution to the children of another continent.

(3) Right, or not? Answer, ye clerks, and all ye hash-munchers in tucked-up boarding-houses.

(4) When bees have wintered finely, and are well cared for in the spring, they swarm early; but if they have just barely got through with their lives, why, then they swarm late. The old Cilician's bees swarmed early.

(5) Notice once more the author's well-informed accuracy. He knew that honey, if harvested as early as possible, and without waiting for it to ripen, would foam.

(6) Whoa! whoa! Gently, dear Virgil, or the good folks won't be able to believe you; and then may be they will go to the other extreme, and say it is all a humbug about bees making fruit-trees bear. You see, if our apple-trees should have a big apple for every blossom, the whole thing would come down "ker-smash," flat to the ground.

(7) How touching this is! It seems as if the old man was too far advanced in years to hope to realize much from young trees. Nothing daunted, he went for the big ones — and succeeded. How many of the girls and boys that read JUVENILE GLEANINGS are going to meet the difficulties of life with the unconquerable spirit of the brave old man of Cilicia?

Last month I wrote that I didn't have to plant pines. Well, what do you think turned up and hap-

pened since? Why, I planted some pines. This is the way it came about. There is a little girl at our house whose name is May. Her mother is dead, and her father she has not seen for years — he is away off in New Mexico, digging for silver. He sends her nuts of the piñon pine. They have a pine-tree out there that, strange to say, bears delicious nuts. Well, May's enterprising auntie tried planting one of the nuts, and it came up very nicely, and very quickly. Guess it thought Ohio a heap better than its bleak windy mountain home. Next thing May and I went into partnership, and celebrated arbor-day by planting some more of those nuts.

And would I tell the children about the sand-ridges of Lucas County? Would a duck swim? I think I could tell something of the sand-ridges that would be wonderful — if true; but first let us patiently dig through with this Virgil business. A wise old king named Solomon taught us not to make ourselves "too plenty," lest our neighbors (little neighbors this time) should be weary of us, and hate us.

And you, friend Root, did say, "I wonder if I shall ever get out to see you." I believe you have about promised to come to the Tri-State fair and convention this fall. If you do, you will be so near that one of my bees could go and alight on your nose without tiring himself out very badly — and I declare, I mean to go too, "just for once," notwithstanding I hate conventions and fairs so.

Richards, O., May 3, 1893.

E. E. HASTY.

Friend Hasty, did you know that I was passionately fond of gardening? Well, I am; and I tell you, I can appreciate every word of that poem you have given us. I have just now been out showing the boys how to hoe the peas, and it seemed to me as if I could be real happy if I were permitted to work in the dirt all the forenoon. Yet the boys, I fear, considered it a sort of back-breaking drudgery. I wonder how many of our children love gardens — nice, clean, orderly gardens. I almost envy that old man with his garden, even if he *was* a stranger in a strange land. Have you got a garden, friend Hasty? because if you have, I shall be a little more reconciled to leaving business here long enough to go to the convention.

## MY VISIT, AND WHAT I SAW AND ATE.

### HONEY AND MULBERRIES.

**I** WILL tell you to-day of a visit, and the first time I ever saw bees swarm (it was more like hearing than seeing.) When a little girl, my grandma went to visit a friend of hers in the country, and took me with her. The children were in school when we arrived, so I had to sit and listen to the old folks, and look at the old-fashioned ambrotypes. My entertainment was not very interesting, excepting the picture of a little dead boy — the first of the kind I had ever seen. But my reveries were soon broken by the exclamation, "The bees are swarming!" and then such a clatter and clash with bell, dust-pan, and hammer, soon stilled that swarm, while at least one pair of curious eyes watched the table prepared with white cover and hive to receive this new swarm of bees.

But in the evening (the children coming home), bees, ambrotypes, and conversation were all forgotten as we started to play. Near the house was a

large mulberry-tree; and after placing a cloth beneath to catch the berries, we were soon in the branches, eating and pulling and shaking off the fruit. It seemed but a little while till we were called in to tea; and while every thing here was nice, the crowning effect in my estimation was the generous supply of honey placed on my plate by the kind mother.

Young folks sometimes eat things that are not good for them, and for this reason they grow up thin and languid, have aches and pains through all their lives, are a misery to themselves and their friends. A good supply of brown bread and milk, and a little tender beef with your bread and honey, will give you health with which to gain your wealth. You know, "As the twig is bent, the tree's inclined." Hoping you will all grow up straight and good, I am your friend —

E. M.

## A CAUTION IN REGARD TO THE DANGER OF FIRE.

### ALSO SOMETHING ABOUT WHAT A CHILD MAY DO.

**R**EADING Mrs. Harrison's talk to the children about fire, brought fresh to my mind the accidents that occurred in our neighborhood. Last spring a little girl 9 years old was playing in the fire that her mother made to burn the trash in the garden. Her clothes caught fire and burned her so badly that she died in a few days. A few months ago, another little girl caught fire from playing with paper in the fire. All of her clothes were burned from off her except the belt around her waist. She died the next morning. About two weeks after that, a little child sat on the stove-hearth; while there its clothes took fire and burned it so that it died in less than a day's time. I, with Mrs. Harrison, warn you to be careful about fire. Do not play in the fire outdoors, where, if your clothes catch fire, a little breeze will soon fan it into a blaze. Neither play with it in the house. Do not sit on the stove-hearth, as it is not a very pleasant seat, and there is danger in sitting on such places. I love the children, and care not about seeing them burned to death through carelessness. Children, you know not how much good you may do by being careful, thoughtful, and earnest in all your work.

A few weeks ago I had the pleasure of listening to an old Englishman preach, who had been converted by the earnest pleadings of a little girl. At the death of his wife and daughter he became a disbeliever. He thought it could not be possible that a true and just God would take those away that he loved so much. He did not read the Bible, go to church, or Sunday-school. He had lived this way for twenty years, when this little girl came to him and said, "Uncle Johnny, we want you to read the Bible, go to church, and Sunday-school." At first he resisted her; but at last he yielded to her child-like voice. It has been two years and eight months since he was brought from darkness into the glorious light of the gospel. He is 74 years old; his nerves seem to be all unstrung, and his steps are very tottering, yet he can stand up over an hour, and warn men to flee from the wrath to come. My little friends, think not because you are small there is nothing for you to do in the heavenly kingdom that Christ has set up on this earth. Think of the many souls that have been blessed through the earnest work of this little girl. Though she could not carry

back-logs, she brought chips and shavings, and began to kindle a fire. God touched this with the finger of love, and it soon became a bright and shining light in this dark world.

I must say something about our bees, or friend Root will think that another bee is after something else besides honey. I want to tell him that I like both bees and honey, although I do not work very much with them. When I go about bees they almost always sting me. When they sting it swells very quickly, and lasts about three days. I would not care so much if I were not leader of a Sunday-school. I am expected there every Sunday morning; and when I appear before my school, I desire my face to look natural.

Last summer my husband sent for two nuclei, which increased to nine during the summer. In the fall we bought five more strong colonies of pure Italians. Packed for ourselves 13, and 2 for a neighbor. During the winter, Mr. Lindley noticed that they were dying. He moved them up stairs into dark rooms, but still they kept dying, until there were only three left out of the 15. We think the reason of their dying was because they had too much pollen in their hives, and when very cold they ate that instead of honey, which caused them to have the dysentery. As we are beginners, we did not learn this until too late.

MRS. NETTIE LINDLEY.

Jordan, Jay Co., Ind., April, 1883.

### OBSERVING-HIVES.

SOME HINTS IN REGARD TO STARTING AND CARING FOR THEM.

**T**HE observing-hives are fitted to a window of the room in such a way that the bees can pass out and in through an opening under the sash, and yet have no access to the room itself where the observer sits. It is a complete hive, though a small one. The operations are the same that take place in a full hive, and the advantage is that you can see it all taking place. It will not do to winter in, and must be started in spring or summer, and discontinued when bees go into winter quarters. It does not furnish surplus honey, but will raise good queens like any nucleus, and will swarm if too full, or if destitute of stores. Before your eyes, and almost under your very fingers, these remarkable processes go on. When some one produces a suitable microscope for the purpose, some of you children will make important discoveries. I have sometimes, with a magnifying-glass, interviewed the guardians of a royal cell; they look sober and grand, their faces like the faces of elephants. My note-books contain accounts of many strange things that I have seen the bees do when nobody was touching them, and they, perhaps, were not aware that —

"A chief's amang ye, takin' notes;  
An' faith, he'll prent it."

I have seen them do some queer things that the books say they never do. By and by we may all become wise enough to leave off saying, "It is never so done," and say, instead, "I have never seen it."

If, therefore, any boy or girl bee-keeper, or would-be bee-keeper, helping about the preparation for the campaign of 1883, can secure a few pieces of board and panes of glass, and when the hives are coming into shape, can build, or cause to be built, an observing-hive; then when the bees start out in spring, some forlorn queen with a cupful of workers

may be rescued from impending ruin, taken in, housed, warmed, and fed, and in a few weeks built up into a flourishing and profitable colony. Or when a strong hive has swarmed, a frame may be taken from it with sealed queen-cells, and a few bees and brood, and the developments will be surprising, though we know beforehand pretty nearly what they will be. This is the best way for boys and girls to begin.

Mr. Root has given us a fine picture of an observing-hive, such as I used for several years. There are also other styles that I have found better. No doubt he can supply any demand that may arise for apparatus or instruction in this fascinating department of apiculture.

D. F. SAVAGE.

Medina, Dec. 7, 1882.

### THE APIS.

A BOY'S DESCRIPTION OF IT.

**T**HE apis is one of the most instinctive little animals that nature affords. It is found in almost all parts of the world; but in a wild state, chiefly in the temperate and the tropical zones.

In its wild state, the apis lives in caves and hollow trees, like the bear. It is not quite so large as the bear, hence it does not require so large a place to dwell in.

The apis is very easily domesticated when properly managed by those who understand it; but when in the hands of those who know nothing of its wants and its habits, it is one of the most difficult animals to tame. One great item in manipulating the apis is to "handle with care." Those who handle the apis rudely, will, sooner or later, have to suffer for it, sometimes severely.

The apis is not very particular about the size or the condition of the cage it is placed in, provided it is neither too large nor too small, and does not contain too much debris; if the receptacle is deficient in any of these respects, the apis becomes dissatisfied, and sometimes takes "French leave," and at other times pines away and dies.

The size of the apis varies with the climate, season, management, and various temporary causes. Its life is usually short, although it sometimes lives quite a while, and at other times it doesn't live so long—owing a good deal to the inclemency of the weather.

The apis is more attached to its mother than any other of the inferior animals, and does not like to be deprived of her presence for a single day. It does not usually fancy a step-mother; but, when deprived of its own, it accepts one, and in a short time will think as much of her as it did of its own mother.

Although the apis does not possess the power of articulation, it possesses a great variety of voice, almost, if not quite equal, to that of the dog. It has a peculiar note to express its feelings on every occasion, so that those who are acquainted with it can tell what it is about by merely giving heed to its notes.

The apis is very industrious, and works for a livelihood, like the ant and the beaver. It feeds chiefly on the pollen and nectar of plants. If it can not get these it will eat almost any kind of fruit or grain—if it is well pulverized.

In general, the apis is not given to burglary when it can get a good living by honest labor; but when it is out of employment it becomes a great thief, and

sometimes a bold and daring robber. There is one thing about it, however, which will always prevent it from making very great success as a burglar, and that is, its voice—it can never keep quiet; besides, it always has a different note when engaged in robbery, so that we shall never need the burglar-alarm to protect us from the ravages of the apis.

The apis doesn't lie dormant during winter, like some of the lower specimens of the brute creation, but it usually keeps pretty quiet in cold weather; and as the plants furnish neither pollen nor nectar at that season of the year, it is obliged to store up its food in summer, or else it will starve in winter.

The apis has six legs and four wings, and a very long tongue, which is divided into a great many parts and adapted to moving in all directions, and is to the apis what the trunk of the elephant is to him.

The apis has no tusks like the elephant, nor teeth like the fox; but it has two strong flexible mandibles, which fill the place of both teeth and jaws. These mandibles work sidewise, instead of up and down, as in most animals.

It uses these mandibles to cut through hard substances, and seldom to chew food with, and rarely as a weapon of defense. It has a weapon, something like that at the "business end" of a wasp, which it usually brings into action when "combatting the foe."

The apis does not belong to the mammalia species of animals, but feeds its young from mouth to mouth, like the pigeon and the dove. It can not fly quite as far as the dove, but is a rapid flyer, and goes a great way to procure its food. It does not carry its food in its beak, like the bird, nor in its jaws, like the ant, but swallows it down into the gullet, from which it is capable of withdrawing it at a "moment's notice;" or, if the food be of such a nature as not to be readily swallowed, it will carry it on its legs, as the hawk and the eagle carry their prey in their talons.

The apis has a common name with which most persons are familiar. This name is composed of three letters, two of which are exactly alike; the other is the second letter of the alphabet.

M. A. JACKSON.

Bangor, Marshall Co., Iowa, April 21, 1883.

#### KIND WORDS FROM A "BLASTED HOPER."

FROM 18 TO 8, \$150.00 OUT, AND NO BEES, NOR HONEY EITHER.

IT is with great grief that I write these few lines to you, to let you know how I am troubled now, for I think I am a good object for Blasted Hopes; for my bees are all dead. After uniting in the fall, 18 to 8, and then losing the 8, I think it about time to quit trying to keep bees. I commenced keeping bees in 1876, and from that time till now I have invested over \$150.00. This may seem big or fishy, but I have the figures to show for themselves. Now, my object in writing this is to let you know how I feel, and that is, that I do not feel contented without the bees, and to have you discontinue GLEANINGS—not because it is not worthy of patronage, but from the fact that I intend to move from this place again; and not having any bees, it would be of little use for me to be having you changing my address so much; but I do hate to have my name erased from your subscription list; and when I get

settled down again, or happen to get some bees, if ever I do, you shall have my name there again. The causes of my bees dying are (they were all in the cellar, but it was a cold one), starvation, with plenty of honey all around them, and from being confined too long in that place, all dead. But a couple of lines that I have partly made up, and I must close up.

You may break, you may shatter the hive at will,  
But the propolis and wax will stick to it still.

I add these, because I mean by it that all I have got left is empty hives, daubed combs, etc. With this I will now close, by saying, good-by, my dear old friend, until we meet again. Much love to you and your family, and, I almost forgot to say, to your employes, especially the girls there. There, I have almost let myself out; but, never mind; if I ever meet any of them, we will make this all up. Well, well; I keep right on writing, so I now shake hands with you in my mind. CHAS. W. WHITE.

Madison, Wis., April 17, 1883.

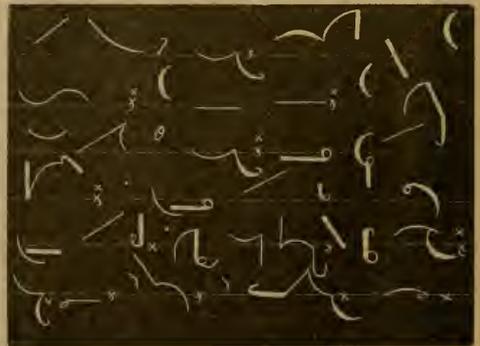

Inasmuch as I have given so many encouraging reports in our juvenile paper, I have thought best to put in one on the opposite side, to let our young people know that sometimes we do have up-hill work as well as the other. Friend W., I am very sorry for your misfortune; but for your encouragement I would say that some of our largest honey-producers have, in their beginning, made much such a report as yours. Stick to the hives and "propolis." Get some more bees going, put your trust in God, and all things will come out right.

#### SOMETHING ABOUT SHORT-HAND.

BY AN OLD GLEANINGS HAND.

TWO months ago the editor of the JUVENILE said he would soon have a person at work here in the factory who would write as fast as he usually talks, and thus save him a good deal of valuable time and exhausting work. If any of the children will try to write down what the preacher says, they will see how utterly impossible this is, with common letters; and hence some may have a curiosity to know how it can be done at all, and to see how it looks when it is done. Of course, we can not explain it, except in the most general terms.

We here give you the Lord's Prayer, written in "Phonography," called *short-hand* for short.

Although these marks look rather crooked, they are a hundred times more regular than common letters. The first little slanting mark you see is shorter than the letter *t*, and yet it is the word *our*.

Now just make this mark and then write the word, and you will realize how slow our common writing is. These marks represent sounds, and not letters, and some stand for words. But the oddest thing is, that some words are expressed by not writing them at all. This reminds one of the Irishman who told the conductor to stop, as he had a passenger aboard who was left behind.

A knowledge of short-hand is getting to be quite common, and those using it get very fair wages. It is used in newspaper and telegraph offices, courts, in churches, and many other places. Even if not used in reporting speeches, it is convenient to write your diary with, and for correspondence with others who use it. Many people waste enough time to learn this art; and if you wish to pursue a pleasant and profitable study, let me advise you to get a book on this subject, and go ahead.

W. P. R.

Medina, Apr. 30, 1888.

### THE LITTLE BEE-BOY.

THE WAY THEY KNOW WHEN THE BEES ARE SWARMING AT JOHNNY'S HOUSE.

JOHNNY'S father has bought him a new 5-cent tin horn. You see, Johnny is to have 5 cents for every swarm of bees he sees, so he takes his seat on the end of a board that sticks through the fence, with the horn all ready, and when a swarm comes out of any one of his father's 100 colonies of bees, he is ready to give the alarm promptly. Don't you think Johnny will have a good time? The Bible says, that he that is faithful in few things shall be made ruler over many things. Now, if Johnny keeps his eyes right on the bees, and doesn't forget, and run off to play—that is, until his papa comes home again, for you don't expect a small boy like him to watch too many hours without a little rest or play spell—if he does all that faithfully, he will likely some time be entrusted with some greater work. Wouldn't you like to be there when the first swarm comes out, and hear him toot! toot! toot?

### THE BEE-EATER—MEROPS APIASTER.

A LETTER FOR THE JUVENILES FROM OUR GOOD FRIEND FRANK BENTON.

FRIEND HASTY, who has given us (you know I want you to count me among the "juveniles") a good letter in the Jan. number of JUVENILE GLEANINGS, did not tell about the "bee-eater" mentioned in the part of the Fourth Georgic published on p. 145, so I'll add a note to his. This bee-eater is probably the green and gold plumaged bird known by the Latin name of *Merops apiaster*, and is common in all Mediterranean countries. The Greeks call it *metissophagos* (which means bee-eater), and the Germans and French have names of similar meaning. The Arabs in Syria call it, however, something like *wor-r-rak*, from the sound of its voice. They come nearly always in flocks—often in large flocks, and circle about the apiary, taking in multitudes of bees

on the wing. Their flight is peculiar. They rise high in the air, generally at an angle of about forty-five degrees, uttering all the while their strange cry, usually repeated twice in rapid succession: *wor-r-rak, wor-r-rak*; then suddenly turning in a very sharp angle, the long fan-like tail spread out, they swoop down toward the bee-hives with widely opened beaks, taking in every hapless bee that is found in their way. I have counted sometimes as many as twenty workers in the stomach of one of these birds brought to me, but for all that I do not regard them as the worst enemies we have in these countries. There are many kinds of lizards, wax-moth larvæ, and, worst of all, great hornets that swarm about in thousands, and fiercely besiege the bees at the entrances of their hives—at times, if no action is taken against them, *snapping up nearly every bee that dares to venture out*. But whenever the bee-eater calls out his *wor-r-rak, wor-r-rak*, the natives are ready, gun in hand, especially as they regard his flesh as a tid-bit. Great numbers of them are caught alive and sold in the bazaars for extremely low prices. One I bought in Cyprus for about two cents was given a perch in a large room, and stayed there for some weeks, his wing-feathers having been clipped. I used to give him daily a few drone bees, but it seems he preferred workers; so when I found crippled workers in front of the hives I used to gratify him with them. I was enabled to examine him closely, and learn some of his ways. The bee-eater is about the size of a robin, and has bright green plumage on the back, shading off into beautiful purple and blue, and on the breast and under side, lemon yellow. The legs are slim; the beak like that of a snipe—slender, and about two inches long, giving a wide gap when open. The tail is like that of the jay-bird, and they may be likened to this bird in disposition, being rather quarrelsome and surly. I did not succeed in taming my specimen, although we had at the same time a jackdaw as tame as a pet lamb, and that got very jealous of the bee-eater. (Mrs. Benton has promised me she would tell the little folks in JUVENILE all about "Dickey," the jackdaw who helped us in our work.)

The manner employed by the natives in catching the bee-eaters alive is peculiar. I have never seen it practiced except in Cyprus and Syria. Straight whips cut from trees are tied together to form a bundle about the size of a man's arm, and this, after having been daubed with a gelatinous, sticky substance, is put among the branches of a tree, or in open places where the birds come. As the color of the substance is either green or gray, according to the place it is to be used in, the birds are not afraid of it, but come and perch upon it, and stick fast by their feet, whereupon they are captured by the peasants. I am very much vexed with my memory for having played me a trick it does not often do; for it has failed to keep for me the explanation of how these funny bird-catchers are prepared. I remember asking all about them, but the information given me on this point seems to have gone out of my mind. But if anybody wants to know about them, I know just who can tell all about it, and that is Philip Baldensperger, of Jerusalem, who wrote the interesting and accurate letter about "the moth that squeaks," published on page 70 of Feb. GLEANINGS.

FRANK BENTON.

Athens, Greece, March 17, 1888.

Many thanks, friend B. By all means, have your good wife tell us "children"

about Dickey, the tame jackdaw. Your plan of catching birds is quite ingenious, and no doubt it would work; but where shall we find the adhesive substance, strong enough to hold a bird by his feet? Will friend Baldensperger, when his eye meets this, bear in mind that we are all waiting to have him give us the desired information?

### MRS. HARRISON TO THE JUVENILES.

A SHORT LETTER ABOUT HENS AND QUEENS AND POSIES.

**W**ELL, juveniles, how are you by this time? I did not write any thing for you last month, because I thought that you wanted the journal all for yourselves. I see in the last JUVENILE that Bettie G. Faris tells how to make hens lay. Who will tell us how to feed a queen, so she will lay "a heap of eggs"? Do you think red pepper would make her lay, or sneeze? I have a shelf across my bedroom window, to hold flower-pots, and roses and fuchsias are now in bloom upon it. In one of the pots some spider plants came up, and they are now about six inches high; and as soon as it does not freeze at night I will transplant them in the garden. Who among you is going to raise the most seed of honey-plants?

MRS. L. HARRISON.

Peoria, Ill., May, 1883.

### MARRIED.

At the residence of the bride's father, May 5, 1883, by the Rev. P. F. Graham, Miss Ida M. Chapin to Mr. Ed. E. Wood, both of Medina.

Another victim! alas, there are three!  
Yet, still here's a trio who will faithful be  
To ledger and desk — oh! time will tell.  
So, Ida, we bid thee a tender farewell.

— LU, CARRIE, and ELLEN M.

When Bess left us a few years ago, it seemed for awhile as if such a one as she would never be found again, to take her place in the clerks' office. By God's providence, however, her friend and schoolmate, Ida, soon took her place, and managed her duties so well that we almost began to think that there was not such another one as Ida. Although she is in our office still, and promises to stay with us during the busy season, when she does come to leave, not only will she be sadly missed here, but I fear our customers, who have long depended on her to straighten out and unravel every misunderstanding, will meet with a loss that perhaps no other one can very soon make up. While I feel sad to think of having these faithful girls go away from me, and take up other duties in life, yet with this sadness comes a cheering thought, because our business has, perhaps more than any other, demonstrated woman's ability and capacity for business. May God bless and be with you all, Stella, Bess, and Ida; and may you often think of us here, though you are with us no longer.

My work in life has been, as you know, to a great extent, testing and trying humanity. I have been constantly looking and watching and praying for helpers with bright, strong, clear intellects, and those who had, together with these intellectual powers, a sense of fairness and right, that, in our business relations, we may do none of you injustice. Well, in our office work it may

be no more than right for me to say that I have found woman's capacity in all these points fully equal to any thing I have ever met in our own sex. I feel to thank God for it, because it is only in these latter days that woman's sphere of usefulness has been developed as it is now; and although Ida and Bess may not be here, I confidently expect God to send us another who will do the work for you, my friends, as they have done it.

Every girl or boy, under 15 years of age, who writes a letter for this department, CONTAINING SOME VALUABLE FACT, NOT GENERALLY KNOWN, ON BEES OR OTHER MATTERS, will receive one of David Cook's excellent five-cent Sunday-school books. Many of these books contain the same matter that you find in Sunday-school books costing from \$1.00 to \$1.50. If you have had one or more books, give us the names that we may not send the same twice. We have now in stock, six different books, as follows; Silver Keys, Sheer Off, The Giant Killer, The Roby Family, Rescued from Egypt, and Ten Nights in a Bar-Room.

"A chiel's amang ye takin' notes,  
An' faith, I'll prent it."

**W**ELL, children, it is the middle of May. The fruit-trees are in blossom, and every thing is lovely. The bees are busy, and so are we here in the factory. In fact, I am so busy that I think I will put in your little letters, and stop right here, and not say another word. We are good friends all the same, aren't we? There, now, go on.

THE ASSISTANT "P. M."

Pa's 8 stands of bees got through the winter all right; he keeps the postoffice, and I am his assistant postmaster. KATIE GOUGH.

Rock Spring, Washington Co., Mo., April 19, 1883.

My uncle has 2 colonies of bees. We took out over 100 lbs. of white honey. They did not swarm last year. They are working well.

FRED G. TRAVIS, age 10.

Watkins, Schuyler Co., N. Y., April 20, 1883.

ALBERT'S CANARY.

My pa has no bees, but I have a canary bird which will, when I open the cage, fly out and alight upon my shoulder; and if I move my head it will perch upon my ear; and when I go up to the cage it will kiss me. ALBERT HOWARD, age 12.

Staunton, Ind., April, 1883.

A COMPOSITION ABOUT BIRDS.

There are many kinds of birds — the redbird and the canary, blackbird and the jay-bird, and the cat-bird. The sweetest birds to sing are the canary and the redbird. The latter has red feathers, and the canary has yellow feathers. C. CARMICKLE, age 11.

Staunton, Ind., May, 1883.

## 4000 LBS. OF HONEY FROM 40 COLONIES.

Papa had 40 colonies of bees to begin the season with last year. He got 4000 lbs. of honey — 1000 lbs. extracted and 3000 lbs. of comb. Papa packs his bees in dry sawdust, on their summer stands. In January he got 25 colonies of one of our neighbors. He lost 4 out of the 25 colonies; and one weak, queenless colony of those he had last fall. Papa has kept bees for four years, and this is the first winter he has lost any. This is my first letter.

INEZ CHAPMAN, age 10.

Millbury, Wood Co., Ohio, April, 1883.

## DECOY HIVES, AGAIN.

I see in the last JUVENILE that you ask who can tell you about swarms of bees going into empty hives. I can tell you a little about it. Two or three years ago we had some hives in the shop, that had frames and comb in them. One day we found a lot of bees flying through the shop, and the next day the swarm came in through the open window and into one of the hives. That evening my pa and uncle took them to the apiary.

FRANK McCULLOUGH, age 9.

Mercer, Mercer Co., Pa., April 26, 1883.

Very good, Frank. The fact you give is a valuable one.

## ANNA'S PAPA, AND HIS LOG-GUM HIVE.

Pa has one stand of bees this spring. He bought two stands last winter. They both died. He bought another this spring. It is working nicely; they are in a round log gum. He thinks they are much better than any other way. ANNA B. BUTT, age 11.

Shermanville, Casey Co., Ky., May 1, 1883.

Now, Anna, I don't think your papa will think keeping bees in log gums is better than any other way, very long; especially if he reads the juvenile bee journal. I am sure we can get him over that. Do you not think so, children?

## CLIPPING QUEENS' WINGS, AGAIN.

I want to give your 7-year-old bee-man credit for giving the best plan for clipping queens' wings that I ever heard of. My pa has improved a little on it, I think. He overhauled 9 hives, and clipped all the queens in less than half an hour. The greatest advantage to him is catching with the right hand. He uses a small knife, and with the queen's fore feet between his thumb and fore finger, he slips her wings over the top edge of the hive, and runs the knife right across her wings, which does the work nicely.

JULIA A. GRIFFITH, age 12.

Shadwell, Va., April 22, 1883.

Pa has 60 swarms of bees, but I don't help him tend them very much, as they sting me so badly every time I go near them. Pa has got Mr. Novice and Blue Eyes' picture in his album. I should like to see Blue Eyes, and have a visit with her. I think she looks so "cute" sitting on her pa's lap, but I suppose she is too big now to sit there. I think I should like some of the little cards to give away to those who swear. I have an uncle who swears, and his little girl, only four years old, has learned it of him.

RACHEL C. KING.

Newtonville, Iowa, April 22, 1883.

You are right, Rachel, in thinking that Blue Eyes has grown to be quite a large girl; but for all that she sits on her pa's lap yet, and I hope she will for a good many years to come.—It certainly is awful to think

of a little girl four years old learning to swear. We gladly send you some of the cards, with a prayer with them that they may be the means of awakening thought on the subject.

Willis Phelps works for us, and he said that he knew you quite well. He drives the 'bus for papa. He has 2 swarms of bees in our garden.

## A SHORT STORY ABOUT IMPORTED QUEENS.

Willis sent to Italy for some Italian bees and a queen. I can hardly tell the queen from the others.

GERTIE MCKISSICK, age 10.

Canon City, Colo., April 21, 1883.

My little friend Gertie, your story reminds me of the "story" of the man and the calf. It was just this:—

There was a man who had a calf,  
And that is half.  
He took it out of the stall,  
And tied it to the wall, and that is all.

## SIMEON (NOT "SIME") AND THE BEES.

My pa has 10 stands of bees; they are doing very well. Pa had 8 queen-cells. He put two into a nucleus, and one into a large gum. The bees did not like to have us work with them. They tried to sting me and pa. I was smoking them, and I kept them away. Every time pa would raise up the cloth they would take after him. He would tell me to come away. I would go away, and about half a dozen bees would "foller" me out. They would not get to sting me, for I would smoke them away. I never got stung more than once in my life. Mr. Root, don't call me "Sime" any more. That is not my name. My name is Simmeon Benjamin Carr. If you please, send me Ten Nights in a Bar-Room.

SIMEON B. CARR, age 11.

Maysfield, Texas, April 6, 1883.

Why, *Simmeon*, I only called you "Sime" because I thought you wrote it that way. After all, isn't your name *Simmeon* with one *m*? I am very glad you can use the smoker so as not to get stung; but I think I would give those bees so much smoke to start with that they wouldn't be "follering" folks about in that way.

## LOOK OUT FOR THE MICE, ETC.

Papa lost 2 stands in March. One of them the field mice destroyed. Papa said he would give me 5 cents for every two I could catch. I caught 4 out of one hive, and 2 out of another. The other 22 hives are doing well. They stayed all winter where they were last summer. Papa bought an albino queen last summer. He was not at home when it came. We fed her and the few bees with her, by dropping honey on the wires over the cage for two days. When papa came he put her in a hive that had no queen. She disappeared, and we have not seen her since. Papa gave me a swarm last year. They died this spring, but I have got some more now.

## THE RUNAWAY SWARM.

Last week a swarm came from the woods, and tried to get into one of papa's hives. Our bees killed a heap of them; the others went back to the woods, and settled on a low bunch of ivy. I followed them and brought them back. I am feeding them and will have a good hive of bees yet. Papa thinks they are a swarm that went from here last summer. They are half Italians.

Chalcedony means a precious stone. Revelation 21:19.

WESLEY L. WHITE.

Broad Run Station, Va., April 17, 1883.

## A BOY'S BEE-KEEPING.

I began to keep bees in 1881, with one colony; in 1882 I increased to 4; Italianized; sold one for \$10.00; lost two this winter; have one left. My bees are in Simplicity hives.

ALONZO RUSKS, age 11.

Milwaukie, Ore., April 14, 1883.

Ma thinks that you will have to put pa in Blasted Hopes, for he has only two hives of bees. We get the JUVENILE. We have eight chickens, and a rooster that can stand on the floor and eat easily from the dining-table. NORMAN GIRDWOOD, age 7.

Allegheny City, Pa., April 22, 1883.

Papa has two hives of bees. Last summer he found a swarm in a hollow tree. He sawed off the top and bottom of it. They increased to two swarms. One of the swarms ran away. We got 12 lbs. of honey from one of the hives.

KATIE TURNER.

Rice, Navarro Co., Texas, March, 1883.

## JOE'S LETTER.

We had a swarm of bees last Sunday, with a young queen. Pa has 7 swarms. He just got a new queen to-day. I went out into the country, and helped pa carry a swarm a mile and a half. The sourwood will bloom next month, then we shall have some fine honey. Pa got a book from Mr. Alley. I like to read GLEANINGS.

JOE W. HARBIN, age 10.

Statesville, N. C., Apr., 1883.

## FROM 9 TO 22, AND BUT ONE STING IN 2 YEARS.

My pa is a trapper, but he keeps bees. He had 9 hives in 1882, and increased to 22. I carry the combs to the extractor, and extract the honey, and then carry it back to the hive. I have had but one sting in two years. I can push a boat across the James River. Pa has some beautiful Italian bees.

EVIE L. STEGER, age 14.

Payne's Island, Va., May 2, 1883.

My papa has one swarm of bees, my sister one, and my mother two. They are in box hives, and we want to put them into Simplicity hives. I can harness one horse to the buggy, and two to the double wagon, and I could when I was only 9 years old, and I am 10 now.

ETTIE BLACK.

Saratoga Springs, N. Y., April, 1883.

Why, Ettie, could you do all that when 9 years old, and you a girl too? I guess you are a wide-awake people at your house.

Mamma says I may write you a letter. She has 20 stands of bees, and no one to help her but me. I think if I have a veil I shall not be afraid of the bees, and I think little boys seven years old can help their mammas lots if they try, don't you? She says that I save her a great many steps. This is the second letter I have ever written, and I hope you can read it.

MALLIE PROPER.

Portland, Ind., May 2, 1883.

To be sure, I think you can help, Mallie; and I am very glad to know you save your mother many steps.

## HOW TO GET RID OF DRONES.

When my uncle wants to get rid of drones he moves the frames into another hive, and takes all the honey from the bees, then the bees will kill the drones. This is only for the honey season.

EMMA M. ISRAEL, age 8.

## HOW TO GET THE BEES OFF—A NOVEL WAY.

My brother used to keep my father's bees by the shore of the bay, and when we wanted to take out

honey we took out a section box, ran to the water, and threw it in the bay to get the bees off from it. My uncle has come from the east. He said that was a new way of taking honey. On account of having no rain on the coast, we have moved the bees to the mountain.

J. P. ISRAEL, JR.

San Diego, Cal., April 24, 1883.

## MAY'S LETTER.

PAPA HAS GOT 100 HIVES OF BEES. HE HAS LOST 37. SOMETIMES I GET A PIECE OF ICE AND WASH MY BROTHER'S FACE. I HAVE A BIG DOLL. IT HAS A NEW DRESS.

Windham, N. Y., Apr. 20, 1883.

MAY COE.

## WILLIAM'S LETTER.

Pa has 11 hives of bees; he has one of the finest-looking hives you ever saw. Pa sent for a smoker. I have fun smoking the bees. Pa has got a thousand of those little pound sections.

WILLIAM GUISINGER, age 8.

Stanley, O., May 5, 1883.

I stay with my uncle. He has bees. He got 2 hives last spring, and now he has 7. They are getting along well. I like to watch them gathering honey out of flowers. I got stung in the summer, up above my forehead, and it swelled my eyes shut.

The rest of the text is, Let us not be weary in well doing, for in due season we shall reap if we faint not.—GAL. 6:9.

BELLA FRASER, age 12.

Campbellville, Ont., Can., April 18, 1883.

## SUNFLOWER HONEY, ETC.

The bees did not make much honey last year, and what they made was made of sunflowers. Papa sent to you for his bee-hives. Papa has only 7 hives, all in good condition.

## POLLEN FROM COTTONWOOD.

The bees are gathering pollen now from cottonwood blooms. I have had my hands right down among the bees, and they never stung me.

MARY HOBSON, age 12.

Toof, Col., April 29, 1883.

## MAMIE'S EXPERIMENT, AND HOW IT TURNED OUT.

My pa has kept bees for 7 years. He had 16 stands two years ago, and the cold winter killed them all but one. Now he has 9. I like to watch the bees at work. Last summer I thought I would help them a little, and caught one and carried it from the stand to the flower, and it put its "hot" foot on me, and I left them alone.

MAMIE M. BARRINGTON.

St. Mary's, O., April 25, 1883.

Mamie, it is said that anybody can lead a horse to water, but that all the world can't make him drink, if he doesn't want to. I guess you found it about so with the bee you carried to the flowers, did you not?

## SHORT, BUT PRACTICAL.

I can tell how to make hens lay. Pound up raw bones for them. Ma has tried it.

ALICE CADE, age 9.

We have only one stand of bees. This is the third one pa has bought, but the first two died before summer came. Pa thinks they will live this time. They are gathering pollen now. Ma and pa have got the bee fever since they have commenced taking GLEANINGS. I can water the horses, put on the bridles, and hitch them to the wagon.

BERTHA H. CADE, age 10.

Damascus, Pa., April 25, 1883.

## ADVANTAGES OF FARM LIFE.

We have turkeys, chickens, ducks, sheep, bees, horses, cows, and little "bossies." I like to live on a farm, for we have eggs, milk, apples, and honey.

## HOW TO MAKE HONEY WHITE.

When papa has comb honey that looks very yellow, he puts it on shelves by the window, and it gets very white. He belongs to the G. A. R. He was a soldier. I have two little sisters and a baby brother. I would like to have a book. I like books and pictures.

FORREST E. RUGER, age 7.

Conklin Station, N. Y., April 28, 1883.

## THE FAMILY OF BEE-KEEPERS.

My papa has four hives; my mamma has three; my brother Joe has one; my brother Churchill has two; I have one. We are all bee-keepers, except baby Blue Eyes. Our bees are Palestine bees. We like them best, because they build up sooner in the spring, and are ready to work earlier than other bees, and are better comb-builders. I have two canary birds. I have been going to school, and we start again in a few weeks. I go to Sunday-school.

MAGGIE WILLIS, age 7.

Nevada, Ky., April 21, 1883.

## THE FLOUR-MILLS OF MINNEAPOLIS, MINN.

I live near Minneapolis, which manufactures more flour than any other city in the world. It has 27 flouring-mills, and in one day can make 27,560 barrels of flour. The mills are run by water power, which is furnished by a fall of 82 feet in the Mississippi. The mills furnish employment for 1200 men. I think that that much flour could feed a good many mouths in one day.

RUTH M. HYNES.

Shingle Creek, Minn., April 27, 1883.

That is certainly a *flourishing* city, friend Ruth. Florida may be the land of flowers, but Minnesota is the land of flours. See?

## BEES AND POULTRY.

Pa keeps Italian bees, but has had some bad luck with them this winter. He has lost several swarms. I keep hens, and they lay eggs every day. I have all the eggs I get from them. I want to make money enough from them to buy a swarm of bees. I feed them hot peas. I go to school every day. I have not missed a day since New Year's. I should like to get a setting of brown Leghorn hen's eggs. Can you tell me where to get them?

BYRON BUCKLEY, age 11.

Cheapside, Ont., Can., April 23, 1883.

Who will tell Byron where to get the brown Leghorns?

## CORA, AND HER TURKEYS AND CHICKENS.

My papa is raising Italian queens. Mother has got some little turkeys and chickens. How many chickens have you, and how many chickens?

CORA F. STEGER, age 13.

Payne's Station, Va., May 2, 1883.

How many bee-hives, is it, Cora? Why, I suppose I must have a thousand or two, but I presume we have only about a hundred that have bees in them. We have only three young chickens, but we have got 30 or 40 grown-up ones, and they lay lots of eggs, too. Only to-day noon, the man who takes care of the horses found a nest in the manger; and the funny part of it was, that there was a hole in the bottom of the manger, and the eggs ran down into the straw;

and although he had gathered the eggs every day for some time, he found in this hole in the straw over 20 eggs, and all good ones.

## FROM 12 TO 46, AND 500 LBS. OF HONEY.

My papa had twelve box hives last spring, and transferred them to rice hives; increased to 46; lost four through the winter; extracted about 500 lbs., besides taking a great deal in the comb. We don't have to use chaff hives here; our bees sit in the yard all winter. Papa has a bee-hat made of wire that he wears when he works with the bees.

## A NOVEL BEE-HIVE.

Mamma hived a swarm in a pillow-case. Papa was gone, and she did not have any hive to put them in. She drove four sticks in the ground and stretched the case over them and put the bees in and kept them until next morning. I should love to have a book if you think this will do. I have done the best I could.

JOHNNIE SIMPSON, age 9.

Dodd City, Fannin Co., Texas, April, 1883.

Very good, Johnnie. I think your mother deserves a medal for originality. Why, this hive will be an improvement on friend Hasty's idea some little time ago of having hives with a cloth case to go over them; and further, it did extremely well indeed.

## MARY'S STORY.

We commenced with two hives, and now we have ten. We all love honey here, and papa says that he intends to work until he gets a hundred. The pigs got into the garden one day and turned over the hive, and my eldest sister tried to set up the hive, and they stung her so badly that she could not see for several days. One day we went up in the orchard, and on one of the trees was about a foot of comb the bees had made; and when they were put into the hive they did not like it, and went away.

MARY L. WASHINGTON.

Nashville, Davidson Co., Tenn., Jan. 2, 1883.

Why, Mary, you had as much trouble, almost, with the pigs and the bees as did Mr. Merrybanks' neighbor a long time ago when we first got acquainted with them. Did you see the picture? I am glad you told us about the comb the bees made in a tree. I suppose it was among the limbs, was it not? Perhaps the bees did it from a sort of old instinct that prompts them to do it the way they did when they lived in a warmer climate.

## A "BEE" STORY.

I did not see the picture of the twins in the JUVENILE. Papa has 35 bees. Ma has one bee. Pa got about 400 lbs. of honey this summer from 13. It was comb honey. Ma says that pa keeps all her honey. But she has it in a yard by itself now, and intends to keep all the bees and honey herself. She gave it some syrup yesterday. Pa's bees wintered well, and are all alive and strong.

NELLIE NICHOLAS, age 9.

Etters, York Co., Pa., March 12, 1883.

Well, the fact is, Nellie, our engravers have not yet sent the picture of the twins. Perhaps they can't make pictures of children as well as they can of old men. Don't you think it may be so? You see, they want to make a child look childish; and as our engravers are grown-up men, probably they can't do it so well. I suppose you mean by the expression "bee," a hive of bees. Of

course, your pa has more than 35 *bees*, and your ma more than one *bee*. I know that in some localities they are in the habit of using the term "bee" for bee-hive, bees and all. So long as we know what you mean, Nellie, it is just as well, isn't it?

SAMUEL'S APIARY.

I go to school in winter, and work in the brick-yard in summer. I earn thirteen dollars a month, with which I keep myself in clothes. We have four stands of bees. One warm day some others came and robbed one hive. The rest are doing very well.

SAMUEL B. HUSTON, age 12.

Somerset, Pa., Apr., 1883.

Will you print some verses on tobacco if I will send them to you? My pa keeps bees, and takes GLEANINGS. I read his books too. I go to school. This is my first letter. CARRIE SHULT, age 10.

Viola, Wis., April 22, 1883.

To be sure, I will print your verses on tobacco, Carrie, if you will send them to me. I suppose you help your pa with the bees, as well as to read his books.

HARRY'S DESCRIPTION OF THE HOME-MADE BUZZ-SAW.

Papa is still making chaff hives. He is making a new saw-mill. We have a saw-mill made out of an old sweep thrashing-machine. The first bee-hive papa made, he made it by hand, and then he went to work and nailed a frame together, to see what he wanted. That big flood in February came up to the bees; and if we hadn't moved them they would have been drowned. HARRY B. DOTERRER, age 11.

New Town Mills, Pa., April 4, 1883.

GRAPE SUGAR FOR SPRING FEED.

I thought that I would write to you. We have 52 colonies of bees. Year before last pa took about 2000 lbs. of extracted honey, and about 600 or 700 lbs. of comb. We have a barrel of grape sugar. It is the boss feed for bees in the spring — better than honey or sugar; no daubing, no robbing, and easy to feed, and it makes lots of young bees. We have Italians, Cyprian, and hybrids; also old bald honey-gatherers that beat every thing in honey harvest. Pa calls them "long livers." J. G. FOGLE, age 14.

Hartsville, Ind., April 6, 1883.

KID GLOVES, BEE-STINGS, ETC.

We had 13 colonies of bees last fall; 2 died of dysentery, and one strong hive died for want of food. Abner Strong said in his letter, that he thought it was the coal oil that made the bees sting aunt's hands, and you said that you thought it was the kid gloves; but my sister tended our bees last summer, and I was her assistant, and I wore kid gloves all the time, and I never had my hands stung once. The answer to Lucy Clark's question, "What is sweeter to the mouth than honey," is "God's word," Psalm 119:103. How many times is "yes" used in the Testament, and where is it? And also, of how many women does the Bible tell us their age?

ANNIE CAMERON.

Anderson, Ont., Can., April 23, 1883.

REUBEN'S DESCRIPTION OF HUNTING BEES IN THE WOODS.

We find where the bees drink at branches, and we take some flour and drop it on their backs; then we stay there until they go and come back, to see how long they are gone, and then find how far home is off. We course them every evening just before the

sun goes down. We can see them a long distance, and can see the gnats betwixt us and the sun. When our bees swarm, we ring a bell, and sometimes we take a looking-glass and have the light right on the bees, and they will alight, and sometimes we have to take our gun and shoot among them. REUBEN DAY, age 10.

Cary, N. C., April 10, 1883.

Thank you, Reuben; the facts you give are quite important. As I understand it, you sprinkle the flour on the bees, in order to see about how far the bee-tree is off from where you start them. Then you wait until evening, that they may see the bees so much better when the sun strikes their wings in the right position. I presume most of the children have seen gnats and mosquitoes sporting in the sunshine, and at such times have noticed how plainly they can be seen, even though quite a distance off. So your folks ring bells, and flash looking-glasses, and shoot guns, do they, Reuben, when they want to make a swarm alight?

THE BEES, THE ROOSTER, AND THE BABY.

To-day is the 9th of April; the bees are busy cleaning house, and are on the maple blossoms and the maple stumps, where trees were cut down this spring. They are good little house-cleaners, but we intend going through the hives and helping them where needed. The grass is growing fast now; the farmers are starting to work in the fields to-day. The baby is sleeping now. We have an old rooster, and he comes and crows near the bedroom, and keeps me chasing him while I am writing. The more I chase him, the more he crows. I believe he does it on purpose. A bee got after him too, which made him hop. We have six young chickens about a week old. A. MAY PROVAN, age 11.

Traer, Ia., April 9, 1883.

Well, I declare, May, how vividly you bring back old times. Sure enough, roosters did wake up babies sometimes, didn't they? And I have chased them just the same way; and the more I chased them, the more they came back and crowed, and then the baby woke up, and mamma had to stop her work, all on account of an impudent old rooster. I should like to see that baby. May I not, if I come to see you?

EMMA AND HER RESPONSIBILITIES.

Father had 5 hives of bees last fall, and lost three during the winter. They had honey enough to eat, and we do not know what made them die, unless they froze to death. Father fed the other bees with the honey they had left. We wintered one swarm in a chaff hive, and they are doing nicely. We had a new bee-house built last fall. I had to do all the chores at the barn this winter, while father and the boys worked in the woods. I had the colt to train, and one horse, two cows, and 35 sheep to take care of. I can harness the horse, and drive it. I feed the hens, and bring in the eggs, besides going to school, and that keeps me pretty busy. We have got 33 little lambs now. EMMA KNIGHTLY, age 12.

East Waterford, Maine, April 23, 1883.

Why, Emma, I should think you would be real happy with the colts and the cows and the sheep and the lambs and the hens, and all the rest. It just makes me wish I were a little girl, and lived on a farm, when I hear

you tell of it. Then, you see, I shouldn't have any great big factory to look after, and so many things that we have all the time getting "out of fix," if I didn't happen to be around just in time. Do you see I have got the word "responsibilities" at the head of your letter? I wonder if you know what "responsibilities" means. I do, if you don't.

BIBLE QUESTIONS, BY CHARLEY MILLER.

You ask if any one can tell where in the Bible the verse beginning with "Be not weary in well doing" is to be found. It is in Gal. 6:9. The rest of it is, "And let us not be weary in well doing, for in due season we shall reap if we faint not."

In answer to Lucy Clark's question, I would say that I can not find any answer to her question. Did she take it from Judges 14:18? if so, she will notice that there is no answer to it, as she will find it is the answer to the riddle in the 12th verse of the same chapter.

Father is feeding sugar at the rate of over 50 lbs. per day. He also feeds rye meal.

Marengo, Ill., April, 1882.

CHARLES MILLER.

Lucy's question is answered in another place, as Charles will see by reading Psalm 119:103.

OUTDOOR FEEDING AND ROBBING.

My pa wants me to write a letter to you, to ask you a few questions about bees and queens. He was feeding his bees on the 10th of April, outdoors, and when he came from his work, about noon, to fill up his feeder, he walked in front of each hive to see how they work. When he came to one hive they were so cross that a dozen or more went for him, and stung him in the face. They were hopping and running around the entrance, and when a bee came near they would catch her on the wing. Pa stood a while there, and then he saw a queen flying around in front of the hive, and was trying to get in; but they wouldn't let her. They sometimes chased her on the wing. Pa opened the hive in the evening, and found no queen and no eggs — only two or three hatching bees. What was the cause of that? Is that wheelbarrow full of books yet?

CAROLINE D. FAUSNIGHT.

Middle Branch, O., April 11, 1883.

It was the outdoor feeding, Caroline, that made the trouble. No one should undertake this who is not an old practiced hand. In the case you mention, the bees got so crazy about the feed that they forgot to leave sentinels, as they usually do, at the entrance of the hives, and the bees from some other hive quickly discovering the fact, walked right in and carried off all their honey. After they did this, the poor queen, not knowing what to do, got crowded out of doors in the general melee. Pretty soon the colony was all broken up, and nothing was left except the few bees just hatching. Your father might have saved the queen, if he had caged her when he found her outside. I have seen the same thing happen a great many times when feeding bees out of doors. Every colony should be carefully watched to discover any attempt at robbing, at the very outset. One who is not a practiced hand might find this difficult to do; therefore I would say, be very careful while feeding in the open air.—The wheelbarrow is yet full, and more too.

HOW THEY HIVE THE BEES AT BERTHA'S HOUSE.

I have not seen any description of the way father hives bees, either in JUVENILE or mother GLEANINGS. It is this: When we hear the bees swarming we ring a bell, which we keep for that purpose, to call one of the men. Mamma and I try to find where the bees come from, because father overhauls them about a week after they swarm, and removes all but one of the queen-cells to keep them from swarming again.

THE "DISH-PAN" HIVER.

When father or Edgar arrives he gets a hive, nine frames, also one comb from the old hive, which must have unsealed brood in it, a large tin dish-pan, for which we have a cover a little wider than the top of the pan, made by sewing cloth on to a wire hoop which is two inches wider than the pan. We think a pan preferable to a sack or basket, because the bees do not stick to it. When the bees have settled they are shaken into the pan, which is held in the left hand, and covered with the cloth; and when they become quiet, which they do in a few minutes, they are poured out on a large sheet of zinc, in front of the hive, and they crawl in.

The verse, "Be not weary in well doing," is found in Gal. 6:9, and in II. Thes. 3:13.

How many of the Israelites went into the land of promise? BERTHA HALLETT.

Galena, Ill., April 25, 1883.

FASTENING THE BEES IN THEIR HIVES WHILE IN THE CELLAR.

I have been reading the JUVENILE, and I found out how old you are. You are 43 years old; am I right? Can you guess how I found out? Papa took his bees out of the cellar the 2d of April—42 hives; they were all alive. He thinks it isn't a good plan to take the wire cloth away from the entrance, as many bees crawled out on the cellar bottom and died.

We have kept bees now six years; never lost more than one swarm in cellar, and this died for want of feed. We have kept entrances closed with wire cloth, and never had any trouble melting comb. We put our bees in the cellar the 1st of Nov.; took them out for a fly the 2d of April. An old bee-keeper told me a while ago that no bees would leave their hive if the cellar was dark. I opened mine for a while, and so many bees have come out that some are weak; 42 were in the cellar, and 42 out.

EDITH M. HALL.

Northfield, Rice Co., Minn., Apr. 8, 1883.

You are right, Edith; I am just 43 years old. I believe I agree with you about fastening bees in while in the cellar. Few things annoy me more than having dead bees around on the floor, ready to be stepped on when anybody passes along. While we had our bees in our bee-house, we had them fastened in with wire cloth over the whole top of the hive, and, so far as I can recollect, no unpleasant consequences followed. I know they will sometimes stay in their hives by simply keeping the cellar dark; but as at other times they won't stay, I think I prefer the wire cloth.

A HINT ON TRANSFERRING, BY A 14-YEAR-OLD BEE-MAN.

I will give you my plan for transferring, after trying every plan I ever heard of. James Heddon's plan is very good at swarming time, but will not answer very well any other time. Take 3 smooth boards,

something longer than the L. frame—one to lay over the box hive. Do not drum the bees, but cut out 2 corners of the hive, and cut loose one side from the comb, and then commence taking out the combs and use the 2 boards for tacking on strips, and for turning frames over with. As soon as you get one or two combs in the new hive, take your board by one end and slip the bees into the new hive, and return the board over the old hive, and continue until all the combs and bees are in new hive. Take all scraps and pieces of honey, and put them on top of the frames; put on the quilt, and the bees will carry down all the honey. In 3 or 4 days, lift the quilt; clear off all pieces of comb, and take off the strips. The strips are fastened with 3-cz. tacks. They are the best I have ever tried.

HARRY GRIFFIN, age 14.

Shadwell, Albemarle Co., Va., Apr. 30, 1883.

Thank you, Harry. As I understand it, your improvement is principally in laying one of your transferring-boards over the top of the old box hive. As the bees naturally crawl up, after being driven out of the combs, or smoked from them, they cluster on the under side of this board. And as often as they cluster, you have only to lift the board up and shove the bees off into the new hive where you want them. We have often practiced pretty nearly the same thing. Your plan of laying broken bits of comb on top of the frame until the bees have taken all of the honey out is just the way we have always done. When empty, the bits of comb go into the wax-extractor.

## KIND WORDS FROM OUR CUSTOMERS.

I have carried a Waterbury watch for the last 18 months. It has given me first-class satisfaction for keeping good time. It can not be surpassed.

GEORGE H. CALVERT.

Lindsay, Ont., Can., Jan. 13, 1883.

The fdn. more than suits me; also your way of packing is No. 1. Last fall I packed 64 colonies of bees on summer stands; found one queenless, and one starved this spring.

G. H. DENMAN.

Pittsford, Mich., Apr. 17, 1883.

The five smokers and eye-glass came promptly to hand, and all in good order. There may be better smokers at higher prices, but I should think your Clark smokers ought to please the most fastidious.

Lucas, Ohio, April 18, 1883.

Z. BLISS.

### TRANSFERRING-WIRES.

Will you please send me 100 transferring-wires? They are the best and handiest thing I ever used for that purpose.

LEWIS METCALF.

Reedsburg, Wayne Co., O., Apr. 23, 1883.

This is to inform you that I have received the goods, and I am satisfied. It is what I should think fair and very prompt dealing. I would not take \$2.00 for my smoker if I could not get another one.

April 24, 1883.

FILLMORE DECKER.

Find inclosed 90 cents, and please send in return the Story of the Bible. I think it is one of the best books for children I have ever seen.

DENNIS SHAFER.

Dawn, Darke Co., O., April 6, 1883.

We have opened and examined every article, and find all correct, and eminently satisfactory. We dearly love such business.

F. W. JONES & BRO.

Coral Hill, Ky., March 10, 1883.

[So do I, friend J.; but we can't always do it so.]

I can not accept your offer to send GLEANINGS for 1883, for half price. I knew that I was taking the risk in inclosing a \$1 bill. But as I have so often

done this I felt no uneasiness, and now I believe that my \$1 will turn up all right. I once had \$5 go astray, but it got back all right. My own fault in not directing it properly.

Shelbyville, Ill., Mar. 17, 1883. J. W. JOHNSON.

[Many thanks for your very kind words, friend J., and for your fair and liberal way of insisting on standing the whole loss. It cheers the pathway in life.]

The colony of bees I received of you in the spring of 1881 has prospered finely under the management laid down in A B C. If its teachings are carried out properly, there is no chance for a failure. They cast the first swarm on the 27th of May last, in the midst of fruit-blossoms, followed by three after-swarms. I took 150 lbs. comb honey, and built up three colonies (nuclei), making eight in all. They wintered finely, packed in chaff, all of them coming out in good condition; and if they continue to push matters as at present, I expect to have some swarming about fruit-blossom time. They are working strongly on the maple at present, which is quite plentiful in this vicinity, being a great advantage to them. If the season proves a good one, I intend to increase to 40, and get some honey too. It looks a little big, but nevertheless I intend to try.

C. H. HUBER.

Rural Valley, Pa., April 23, 1883.

I received your monthly and price catalogue, and am well pleased with the same. I intend to go into the bee and honey business. I have not got the money yet, but I think you will hear from me this fall. I have had no experience. I think the best thing I can do is to join your A B C class, and subscribe for GLEANINGS, get some of your implements, and away I go. I have read and looked your publications through. By the tone of what I read in them, I take you to be a brother in Christ; and as such I have faith in what you say. I have been humbugged some since I have been in this world. I am a Pennsylvanian, 35 years old. I notice some bees come on hickory stumps where I cut the tree. I think they are wild. I will run a little risk, and send you a little money in a letter for a bee-hunting box.

J. W. WISE.

Verona, Lawrence Co., Mo., March 5, 1883.

[May God bless you for your kind words, friend W. If any thing in our deal should ever be wrong, I trust you will be kind enough to tell us so.]

### HOW I GOT INTO IT.

Three years ago a gentleman came to me to purchase some bees in an old box hive; and in the conversation he spoke of A B C and GLEANINGS, which he said taught the new system of bee culture. I asked the price, and found one hive would get both; so I requested him to order them immediately, selling him 3 or 4 hives.

The books soon came; I glanced at Medina, O., and commenced to read with suspicion, simply because the idea of Yankee trickery had crept into my mind like a great long old ugly snake, and coiled itself all round in there, of its own accord; but, lo! when I read on page —, A B C, where the engineer stopped "10 minutes of noon," etc., I "kind of wilted," and the old snake got a blow on the head which made him begin to unwind and move, and he has continued to move until I see clearly a great number of good men all over the North, whom I have learned to love, and especially a little bald-headed fellow about Medina, living in a new house, but who has no new baby, like a fellow in Texas, who ought to have less hair and more brains. Of course, I continued to read and act, shipping the first Simplifics, perhaps, that came to this part of the State; and I do not pretend to say what my little apiary is worth; but I would part with it more readily than with what has been developed by that little incident—the man coming to buy bees.

Mr. Roof, did you send him? I am inclined to believe you did. Strong and powerful man, who in secret kneels down and then dispatches telegrams round the world, he knows not to whom, and I am in debt to somebody—who is it? Now, since I am through my piece, and it don't sound well to me, you may open the stove-door and put it right in the flames.

Dodd's City, Tex., Feb. 19, 1883.

J. H. RODERICK.

[May God bless you for your kind words, friend R. Let us try to think it was God who sent the man to your house to buy the bees, and that it is God who is sending us blessings every hour in the day, if we will only receive them as such.]

I have tried the fdn. mill, and would not give it for a load of rubber plates.  
C. A. HATCH.  
Ithaca, Richland Co., Wis., Apr. 20, 1883.

OUR \$4.50 PLATFORM SCALES.

The scales that I brought from your factory when I was there weigh as well as the high-priced ones. I would not take \$8.00 for them if I could not get another pair.  
D. BUTTERS.  
Bloomington, Mich., May, 1883.

Your A B C book is just what I wanted, and I am much obliged to you for explaining every thing so carefully; and if I have a dollar left when I get my chaff hives finished, I will invest it in GLEANINGS.  
ANNA GRAY.  
Adams, Gage Co., Neb., April 25, 1883.

I received the goods in fine order; never saw goods better put up for shipping. I am well pleased with the thin foundation for sections. I am disappointed in the Clark cold-blast smoker; it is A No. 1; throws clouds of smoke. I could smoke down yellow-jackets with it.  
E. E. SMITH.  
Pittsford, Mich., April 13, 1883.

I received the A B C in due time; and to say we were not greatly surprised would not be doing it justice. We are both well pleased with it. My wife says it is just the thing, and the book she has always wanted. I do not see how you can furnish so large and valuable a book for such a price. We are highly pleased with this great work, and your good and kind words to the little ones, and all, so that we must certainly be asked to be remembered among the many friends you must surely have.  
H. F. CURRENS.  
Goodland, Ind., April 16, 1883.

A GOOD REPORT FOR THE GLASS NEST-EGGS.

The eggs and other articles came safe. Thanks. But these handkerchiefs are marvels for cheapness; but those eggs are the boss. The hens nearly cackled themselves to death looking at themselves in those glass eggs, and tried to fill every nest with fine large eggs to match those large ones. I sent and got some wooden eggs last spring, but they did not like them. They would kick them all out of the nest. Good luck attend you, my friend.  
MRS. NELSON KELLY.  
Ferndale, Whatcom Co., Wash. Ter., April 15, 1883.

THE A B C BOOK.

A B C at hand, with many thanks. This really is "pressed down and running over;" it has paid me more than twice its cost already. Picture to yourself a man in a dilemma, not knowing what to do, when a friend steps up and says,—  
"What's the matter?" While I point and say,—  
"Look there." And he says,—  
"Oh! we'll soon fix that."  
Well, that friend was A B C. May the good Lord bless and prosper you in your work of love and charity!  
JAS. BEATON.  
Highgate, Kent Co., Ont., Can., May 1, 1883.

I do not know how to acknowledge your kindness to a poor little girl. Please accept my heartfelt thanks for A B C and GLEANINGS; also for your promptness in sending sample sections and foundation. Papa has prayer and reading of the Bible morning and evening, and he does not forget Mr. Root's kindness to his little girl. Papa says I must work hard, and pay Mr. Root for A B C and GLEANINGS. He says they are worth five dollars; he says he will help me all he can. I was going to write about bees, but I could not help trying to thank you in my uncouth way for your kindness.  
Valley Point, Pa.

BETTER THAN SAMPLE.

I received goods to-day. I am well pleased with them. Every thing came in good shape, except smoker, which was jammed, but I think I can straighten it so it will be all right. The foundation is much brighter than the samples you sent.  
J. C. MERRIMEN.

[I am very glad, friend M., if you find the goods better than the sample. I think it was friend Heddon who said fdn. manufacturers always sent out a better sample than the good they furnished. In our case it happened to be the other way this time. Perhaps we don't always do as well as that.]

THE JONES PAILS.

The 2-lb. Jones pails make the nicest package of extracted honey I ever saw, and will sell at sight, and the smokers are greatly improved.  
JOHN DIEFFENBACH.  
Crosskill Mills, Pa., Apr. 30, 1883.

A KIND WORD FOR RAILROAD OFFICIALS, ETC.

Goods received O. K. The smoker is a perfect gem. The A B C book is much neater and larger than I expected. Express charges were very reasonable. No delays. All railroad agents are not so very bad men. Our agent here is a gentleman in every respect.  
L. H. WILCOX.  
Farmington, W. Va., Apr. 28, 1883.

I will tell you how to publish GLEANINGS semi-monthly. Just take some of the matter intended for GLEANINGS Sen., and put it with Junior GLEANINGS, making one thinner and the other thicker, retaining a juvenile department, thus equalizing the weight and thickness of both. Bind both as you now do GLEANINGS Sen., with the same neatly gotten-up cover. You are giving us a "thundering sight" of good bee matter, any how, for one dollar. If you can do this without raising the price, all the better; if not, put on what will justify the change, and I think very few will "squeal." Shall I give you a report of my wintering? I am only a little bee-man, anyhow.  
C. GARWOOD, 553.  
Baltimore, Md., May 6, 1883.

We thank you for your promptness in replacing the first queen sent. In fact, you were almost too prompt for us, as we had no queenless colony, so we thought we would catch a virgin queen from a certain colony. In our manipulations, the young queen and a good many of the bees flew away and clustered on some brush near. Taking a frame of brood from an old colony, we hived them in a new hive, and proceeded to make sure there was no queen left in the colony. We failed to find any, or any cells; so we turned the Italian queen on to a frame of brood, and covered her with a wire cage. The instant she touched the comb she dove into a cell and took a good meal of Florida honey.  
H. S. ALLYN.  
Orange City, Fla., Apr. 16, 1883.

I wish to thank you, friend Root, for the many courtesies we have received from you, as well as for your excellent journal. I am not a bee-man. I fear I never shall be; have had nothing but losses and troubles with them since I first read a copy of GLEANINGS and became interested in them. I have spent some 50 or 60 dollars, and have now three weak colonies, and one of them queenless. I have, however, derived a great deal of pleasure in reading GLEANINGS and A B C, and other bee publications; but now my A B C is loaned to some one who has forgotten to return it, and I have forgotten who, as I loaned it until it was nearly worn out. My smoker, too, has been loaned until it was nearly worn out, so I had some benefit from them in that way. Now, friend Root, I do not want to see my name in print. I am writing this as a personal letter. I am not a Christian, as you and my folks are, but know that you are doing a good work. After using tobacco 25 years to excess, I have quit the habit. I would sooner think of paying you for a dozen smokers than ask one for doing right. I have saved more than the price of a gross of smokers in the last 18 months, in cigars and tobacco alone. I am not overestimating the amount, and must confess to you that the Lord has been better to me than I deserve, as I have no desire for tobacco.  
J. M.

[But, friend M., your experiences are so very valuable I feel we must have it for print, and I take the liberty of using it, suppressing your name, as you see. You say you are not a Christian; but it seems to me you are in spirit, even if you don't stand so before the world. Your concluding sentence persuades me that your duty stands clearly before you, and that nothing more is needed for you to do, except to stand up before men and acknowledge your Lord and Savior, Christ Jesus. Come with us, and be a soldier of the cross. I will pray for you, and I am sure others will. I am very glad indeed to bear your testimony on tobacco, and I am glad to see that you fully realize the amount you have saved by giving it up. That single item alone ought to be a strong motive for others to go and do likewise.]

He that tilleth his land shall have plenty of bread.—Prov-  
ERBS 28:19

GLEANINGS for Jan., 1883, is out of print. We will pay 10 cents each for them. Please put your name on the wrapper, and drop us a postal.

### WAX.

We have now a fine lot of wax on hand, perhaps a couple of tons or more, and it is coming in so freely that the prospect is, that the price will soon drop. However, we will, until further notice, pay 35 cents cash, or 37 cents trade for fair wax.

THE Clark smoker seems destined to go beyond any thing heard of before in the line of implements for the apiary. We purchased, in one single lot, one ton of wire for making the springs. Ernest estimates that this quantity, at the rate they are going, will hardly suffice for this present season. Just think of it, friends; a ton of springs!

We have just got hold of the little book called "John Plowman;" and by taking a quantity, we are enabled to sell them at 10 cts. each; by mail, 3 cts. extra. The book contains 40 pictures and 122 pages, and was written by the great English minister, Chas. H. Spurgeon. The book is so full of wholesome instruction that I feel happy every time I sell one.

### ROTTEN WOOD FOR SMOKER FUEL.

By advertising in our county paper, we have received some very nice rotten wood for smokers. It is broken up into pieces just right to put into the smoker, and it is dry, rotten elm that ignites readily with a match, and can scarcely be put out without wetting it. We have it put up in sacks holding two bushels each, and we offer it for 50 cts. a bushel, sacks and all. Probably most of you can get it out of any of your forests, cheaper than you can buy it of us; but if you can't, when you are ordering goods have a sack sent along for a sample. As it is pretty light, it could be shipped by express without very much expense.

### THE RUSH FOR SUPPLIES FOR THE APIARY.

We are now in the midst of the greatest demand for supplies for the apiary, probably, ever known before. We have, perhaps, in our works, and orders on hand, \$5000 to \$10,000 worth of goods. The question comes up now, about delays on orders. The number of hands we have employed, and the way the orders are necessarily scattered about all over our establishment, it is quite difficult indeed for us to tell how soon orders can be filled. It may be two or three weeks, or it may be convenient for your order to be filled to-morrow. Another thing: It hin-

ders the clerks greatly, as well as the workmen in the rooms, to go to work and hunt up an order. Very often, time enough is consumed in trying to trace an order, to have boxed it up and sent it off. It has been suggested that we should refuse to receive any more orders. My friends, this would hardly be practicable, because we should not know what orders to refuse. In reviewing the bills of to-day, I find an order filed that was received yesterday; and on inquiring how it obtained preference over so many others, I was told the man wanted only two chaff hives complete, and these happened to be in stock ready to be shipped, and so they were simply marked and sent off. Now, this is the case with a great quantity of our goods; in fact, with nearly all of the goods from the counter store. It is also the case, to a certain extent, with hives, etc. One day we may have a great quantity ahead; the next, the orders may take the whole of them. All I can promise to do is this; that we will send your goods just as fast as we possibly can; and any time when you get tired of waiting, we will promptly return your money. With the piles of orders before our office clerks, however, it may take a day or two before we can find your order and get your money back. Another point: Several have written to us complaining of the delays from other factories, and stating that they have withdrawn their orders from them and sent them to us so as to get their goods *at once*. I wouldn't do this, friends.

One plain remedy stands out sharp and clear, and that is, to order your goods before the middle of May, and just on the eve of the swarming season. Past experience indicates that orders begin to drop off somewhat by the first of June. Therefore it is quite likely, with our present force of workers (about 110 in all) we shall have pretty much all of our orders filled in three or four weeks. I mention this, that you may know how to decide intelligently about ordering your money returned.

Before blaming us very much for this state of affairs, bear in mind that we are building a new factory, on purpose to be able to meet such emergencies, and we are doing all we possibly can to be able to avoid these very annoying delays. Our freight has increased to such an extent that we now have two large cars run up on our branch track, that are filled with goods, and sent off daily. If you could see the great stack of boxes and bales that are daily loaded up, you might think that at least *some* credit was due us. Orders by mail and express still go off as fast as received.

Do you want to know how you can help us greatly in facilitating the filling of your orders? You can do it this way: Call things *just as they are called* in the price list, and *give prices*. Use plenty of paper, and write plainly; but don't put any thing on the same sheet with your order, except business *absolutely necessary* for the filling of such order. Bear in mind, that what you write with your orders must be read by several clerks, and sometimes by those who are comparatively new in the business.

LATER.—Just before going to press, we have decided, in view of the great number of orders on hand, to send at once such a part of your order as we can, and the remainder at another shipment, as we think this will better please you, as a general thing, than to hold goods that are ready, for other things that are not ready. Please don't complain when you find that we have done this.

Names of responsible parties will be inserted in any of the following departments, at a uniform price of 20 cents each insertion, or \$2.00 per year.

**\$1.00 Queens.**

Names inserted in this department the first time without charge. After, 20c each insertion, or \$2.00 per year.

Those whose names appear below agree to furnish Italian queens for \$1.00 each, under the following conditions: No guarantee is to be assumed of purity, or anything of the kind, only that the queen be reared from a choice, pure mother, and had commenced to lay when they were shipped. They also agree to return the money at any time when customers become impatient of such delay as may be unavoidable.

Bear in mind that he who sends the best queens, put up most neatly and most securely, will probably receive the most orders. Special rates for warranted and tested queens, furnished on application to any of the parties. Names with \*, use an imported queen mother. If the queen arrives dead, notify us and we will send you another. Probably none will be sent for \$1.00 before July 1st, or after Nov. If wanted sooner, or later, see rates in price list.

# Look Here!

If you have not seen M. B. Moore's new circular, of queens, it will pay you to send for it at once. Warranted Queens in June, only \$1.10, and a 25 cent specimen free with each order. Now is your chance. 6d M. B. MOORE, Morgan, Pendleton Co., Ky.

## FOR SALE.

A limited quantity of Fresh Vandervort light and heavy Foundation, of improved style, made on new machines. Also Wire Nails and Tin Points. 6d C. R. ISHAM, Peoria, Wyo. Co., N. Y.

# FOR SALE CHEAP!

About two acres of land, with dwelling-house and other improvements. Also 25 stands of bees in Root Simplicity and Van Deusen-Nellis hives. Situated about 300 yards from L. & N. R. R. depot, in the village of Grand Bay, Ala. For further information, address J. J. DAVIDSON, Grand Bay, Ala. 6d

THE

# British Bee Journal.

The British Bee Journal is now mailed to our address in packages, semi-monthly. In order to dispose of them, we offer them at present at \$1.00 per year, postage paid, beginning Jan., 1883. Will guarantee safe arrival of every number. A. I. ROOT, Medina, Ohio.

## JUST OUT!

New Circular, and price list of Bees, Queens, and STENCILS for bee-keepers' use. 4-9d JOS. M. BROOKS, COLUMBUS, BARTHOLOMEW CO., INDIANA.

E. T. LEWIS & CO., TOLEDO, OHIO,

Manufacturers of the U. S. Standard Honey-Extractor (new improvements), and all other Apianian Supplies. Send for circular. 1tf

SEND postal for my 20-page price list of Italian, Cyprian, and Holy-Land Bees, Nuclei, Queens, and Apianian Supplies. 4tf

H. H. BROWN, Light Street, Col. Co., Pa.

NOW a limited number of Fine Italian Queens; also, Bees by the Pound, cheap. Apply to E. H. COOK, Andover, Tolland Co., Conn. 6

SPLENDID QUEENS this month, \$1. each; six for \$5.50. 6d F. L. WRIGHT, Plainfield, Liv. Co., Mich.

# FARM FOR SALE

IN A GOOD LOCATION FOR BEES.

I offer for sale, cheap, my farm of 40 acres, 1¼ miles from Hourishing village and R. R. station. Frame house, with good cellar, well, etc. Price \$1600; \$630 may remain on time if desired, at 7 per cent. Other particulars by mail. E. HUNT, SHERIDAN, MONTCALM CO., MICH. 6d

WISHING to engage in other business in the fall, I have sold my apiary, and desire a position in an apiary during the summer. Would be willing to instruct a beginner. Ten colonies, 300 L. combs and hives; 20 nucleus hives, cheap. 6d 75 Bagg Street. A. B. WEED, Detroit, Mich.

FOR SALE.—A good 3 horse power Boiler and Engine, in good running order, for sale cheap. Correspondence solicited. Address 6d O. H. TOWNSEND, Kalamazoo, Mich.

# Holy-Land Queens:

Untested, this month, single queen, \$1.00; six, \$5.50; twelve, \$10.00. Warranted, 25 cts. more each. No tested queens this month. Bees, \$1.00 per lb. For \$1.00 extra with order for queen I will send Cook's Manual of the Apiary, late edition, cloth, or the A B C in Bee Culture. I. R. GOOD, TULLAHOMA, COFFEE CO., TENN. 6d

Late of Nappanee, Ind.

# THOSE WHO WANT HYBRID OR BLACK QUEENS, TAKE NOTICE.

We have bought a large number of hybrid and black colonies of bees, which have fine queens in, that we will sell at 50 cts. for black, and 75 for hybrid queens. For my advertisement of Albino-Italians, etc., refer to the April and May number of GLEANINGS. 6d

S. VALENTINE & SON, HAGERSTOWN, MD.

KEPT IN STOCK.

NO. 20.

These labels are printed on glazed paper, assorted colors, and trimmed to border. They are kept in stock with the sources White Clover, Mountain Sage, Basswood, and Autumn. Price, 100, 15c.; 1000, \$1.00. In ordering, simply give the No. source desired, and quantity wanted. A. I. ROOT, Medina, O.

## ITALIAN BEES.

During June Queens reared by E. M. Hayhurst, \$1.50; reared by myself, \$1.00. Full colonies, \$7.00. Bees by the pound, \$1.00. E. A. GASTMAN, Decatur, Macon Co., Ill. 6

ESTABLISHED 1855.

BEEES

## HEADQUARTERS

We have constantly on hand a large stock of Domestic and Imported beeswax in original shape, which we offer to manufacturers of Comb Foundation at lowest prices. Write to us for prices. Address

**R. ECKERMANN & WILL,**  
Beeswax Bleachers & Refiners, SYRACUSE, N. Y.

WAX

# Honey Column.

Under this head will be inserted, free of charge, the names of all those having honey to sell, as well as those wanting to buy. Please mention how much, what kind, and prices, as far as possible. As a general thing, I would not advise you to send your honey away to be sold on commission. If near home, where you can look after it, it is often a very good way. By all means, develop your home market. For 25 cents we can furnish little boards to hang up in your dooryard, with the words, "Honey for Sale," neatly painted. If wanted by mail, 10 cents extra for postage. Boards saying "Bees and Queens for Sale," same price.

### CITY MARKETS.

**NEW YORK.**—*Honey.*—We take pleasure in quoting honey the same as last issue. *Beeswax* is becoming more plentiful in our market. Prime yellow sells at 37½ @ 38½ c.

We will offer prizes to bee-keepers the coming season, to the one who gets his honey up in the most marketable shape. Circulars for same are in press, and we expect them this afternoon, at which time we will be ready to send out copies.

H. K. & F. B. THURBER & Co.

New York, May 23, 1883.

**CLEVELAND.**—*Honey.*—There is a very moderate demand for 1-lb. sections of best white honey at 18 to 19 cts.; 2 lbs. are dull at 17. Extracted, no sale.

*Beeswax*, none offering; nominally, 40 to 50 cts. per pound.

A. C. KENDEL.

Cleveland, O., May 23, 1883.

**CHICAGO.**—*Honey.*—The demand for comb honey is almost nominal. Prices are very irregular; 10 to 16 cts., according to style and quality; extracted, 8 to 9 cts., according to quality. Some lots of fine white clover, 10 cts.

*Beeswax*, 38 to 43 cents.

R. A. BURNETT.

Chicago, May 22, 1883.

**CINCINNATI.**—*Honey.*—The market for extracted honey is lively. Demand exceeds the arrivals by far. Our stock is small, and we are always in danger of having sold out. We pay 7@10 cts. for good honey on arrival. The latter price for choice clover. Price of comb honey is nominal, with a slow demand.

*Beeswax.*—Arrivals of beeswax are plentiful. We pay 35 cts. for a good article on arrival.

Cincinnati, O., May 22, 1883. CHAS. F. MUTH.

**DETROIT.**—*Honey.*—The honey market is very dull. A good quality of comb honey brings about 15 cts. Nothing else will sell. *Beeswax* scarce at 35c.

Detroit, Mich., May 24, 1883. A. B. WEED.

Do you buy honey? If so, I have about 1000 lbs. extracted clover, and basswood; would like to sell all in 200-lb. kegs. What can you pay for it?

C. A. HATCH.

Ithaca, Richland Co., Wis., Apr. 7, 1883.

I have two barrels, and a half-barrel of heart's-ease honey that I will put on board cars for 8½ c. per lb., no charge for barrels.

J. A. GREEN.

Dayton, Ill., May 10, 1883.

## Clothes-Bars, OR Towel-Rack.

The above is made of strips of basswood that come from our section machinery, and this is why we can furnish them at such a low figure. The ends of the bars are tipped with a neat nickel-plated ferule; and when screwed up against the wall it is a strong and neat piece of furniture. Price 15 cents; 10 for \$1.25, or 100 for \$11.00. By mail, 10 cts. each extra.

A. I. ROOT, Medina, O.

## SHIPPING-CANS For HONEY.

### "Iron-Jacket" Honey-Cans.

I presume the friends are aware that ordinary tin cans are not very safe for shipping full of honey, unless boxed or crated. The cans above are ready to be shipped anywhere.

### PRICES.

1 Gallon,	-\$0.25 each.
2 "	38 "
3 "	47 "
5 "	68 "
10 "	1.10 "

By figuring 11 lbs. of honey to the gallon, you can easily see how many pounds each can holds. They are made from tin plates. A sheet-iron casing, with wood bottom, protects them from bruising. The iron jacket is stronger than wood, and far more serviceable. They neither shrink nor swell, and do not split nor fall apart. Every can is tested by steam and guaranteed to be tight.

A. I. ROOT, Medina, O.

## 1883. ITALIAN QUEENS! 1883.

Still they go! Bees for business now ready to ship. Send for our new circular of Queens, Full Colonies, and Nuclei. It tells how to introduce queens.

6d T. S. HALL, Kirby's Creek, Jackson Co., Ala.

## FIELD PEAS THAT BEAR HONEY!

Our readers have doubtless noticed the many reports we have had of honey from peas during the past year or two. We have just received a large lot of them for seed, from friend Burrows, of Lynnville, Tenn., who writes in regard to them as follows: "These stock peas, so celebrated for honey, should be planted in June, and will make a continuous flow of honey from August to frost, and a heavy crop of peas." Price \$1.75 per bushel; \$1.00 for half a bushel; 60 cts. per peck, packages included. By mail, post-paid, 20 cts. per pint.

A. I. ROOT, Medina, O.

## CANDY for CHILDREN.

### MAPLE SUGAR vs. CONFECTIONERY.

Children always want candy, and somebody has said that children always ought to have candy, or some equivalent. While in Cincinnati last fall, friend Muth said that he doubted whether any pure candy could be found in the city; that is, candy made of pure cane sugar. Well, maple sugar bought of our home farmers, we know is pure, and we have this season purchased more than a ton, made by the farmers directly into little cakes. By taking more pains than they have ever done before, they have given us little cakes of a creamy whiteness and delicacy of flavor that seem to me far in advance of any confectionery that was ever made in any of the cities. To keep these little cakes nice, and preserve the flavor, we have had our girls wrap them in tissue paper just as fast as they were brought in from the sugar-camps. We sell them for 3 cents each, 25 cts. for a package of 10, or \$2.00 for a basket of 100. If you want a sample of what can be done in the way of nice maple sugar, just send us two 3-cent stamps, and we will mail you a sample cake.

A. I. ROOT, Medina, Ohio.

Vol. XI.

JUNE 1, 1883.

No. 6.

TERMS: \$1.00 PER ANNUM, IN ADVANCE; 2 Copies for \$1.90; 3 for \$2.75; 5 for \$4.00; 10 or more, 75 cts. each. Single Numbers, 10 cts. Additions to clubs may be made at club rates. Above are all to be sent to ONE POSTOFFICE.

*Established in 1873.*

PUBLISHED MONTHLY BY

A. I. ROOT, MEDINA, OHIO.

Clubs to different postoffices, NOT LESS than 90 cts. each. Sent postpaid, in the U. S. and Canadas. To all other countries of the Universal Postal Union, 18c per year extra. To all countries NOT of the U. P. U., 42c per year extra.

**NOTES FROM THE BANNER APIARY.**

No. 43.

FROM 60 TO 16.

**I** REMEMBER that one of my former articles was headed, "From 3 to 30," and I thought the above would be an appropriate title for an article at the present time. You will remember that I told you last month that I had 29 colonies, the most of them in pretty fair condition, and so I did; and, as the weather was warm, they started out well. Even the weakest had sealed brood in two frames, and unsealed brood in two more combs; and considering that I had lost more than one-half of my bees, I felt quite jubilant. One morning I went out of doors and found the mercury down to about 28°. Of course, the bees had all crawled into the center, and rolled themselves up into a ball, and some of these "balls" were not so large as your double fist. All of the brood outside of the cluster was, of course, killed; not only that, but the cold seemed to be the "last straw that broke the camel's back" with the old bees, whose health had been broken down with dysentery during the winter. Each day added a new layer to the dead bees upon the bottom-board, and the cluster of bees grew "smaller by degrees and beautifully less," until only a mere handful remained. Sometimes I took out the queens and used them in filling orders, and united 3 or 4 clusters into one. The bees didn't quarrel; but in a few days there would be only a handful left. I believe this is what is called spring dwindling, and I also believe it is

the result of imperfect wintering. There may be a goodly number of bees in the hive, and, to all appearances, they may be healthy; but the dysentery from which they have suffered has so weakened them that they can bear neither cold nor hardships. Oh what a comfort it was to take a peep into those colonies that had been fed granulated sugar! sealed brood in five combs, and the hive crammed full of bees. The cold seemed to have no effect upon them: there were so many bees that they could resist the cold. Well, I have stored away the combs inside the depopulated hives; have bought a few more of friend Robertson, of Pewamo, and shall commence the season with about 25 colonies, the same as I had last season.

I received the JUVENILE last evening, and, when reading of the rush and hurry and amount of business that your mind had to deal with and manage, I could not help comparing it, with my own quiet life. During the rainy days that we have had, brother and I have been working in the shop, putting together those nice white sections that friend Heddon furnishes, making cases to hold them, making hives, and doing our sawing with that home-made buzz-saw. And what comfort we are taking, friend Root! I sometimes find it a little difficult to "make both ends meet," yet I am satisfied with myself and my surroundings, and am perfectly contented. There is a very comforting thought for you, friend R., and that is, you are giving employment to and helping others. Oh, yes! there is one more thing that I wish to mention, and that is, brother and I have, I believe, got every thing here at home that we shall need in

the apiary this season; at least, there is nothing that we shall have to "send off" after, and we are all ready for business, just as soon as business is ready for us. Perhaps this is one reason why we are "taking comfort." Well, here I am taking up valuable space in GLEANINGS, without, I fear, imparting much information; so, after saying that that little piece of photography in the JUVENILE is very neat, I will close.

W. Z. HUTCHINSON.

Rogersville, Genesee Co., Mich., May 19, 1883.

P. S. — Phew! Here is May 21st, and the snow is flying, and the mercury is down to 32°. I was out among the bees this morning at 4:30, but the combs seemed to be so well covered with bees that I don't think that much if any brood will be chilled; but I just do wonder when the warm weather is coming to stay.

W. Z. H.

But there is a very good moral to your paper this month, friend H., and that is, the comfort of having every thing ready for business as soon as business is ready for you, as you express it. At least, you think you have every thing ready; but with such a boom with your 25 colonies of bees as our friends sometimes have, you may find yourself suddenly short, after all. Another good point you make is the wisdom of being contented with your surroundings. I don't mean contented in any sense that would lead you to lead a lazy life, but accepting the circumstances and your surroundings. I suppose this same spirit, if followed a little further, would make us contented with 32 degrees, and frost and snow, even after the middle of May. Not very contented, perhaps, but master of the state of affairs, and ready to make a good season's work notwithstanding. Eh?

P. S.—Now, friend H., I think I want to add a postscript, as you did. I am glad to hear you come right out and say, "From 60 to 16." When a man is beaten, and beaten unexpectedly, I do like to hear him come out squarely, and own up. You see, it helps our A B C class to know what they may expect, and to remember that bee culture is not roses without the attendant thorns.

## RUNAWAY SWARMS, AND OTHER MATTERS.

### HONEY FROM WILLOWS.

OUR bees have had two days at willow bloom. We have lots of willow hedge here. The sixth and seventh of May were nearly equal to two days in basswood, judging from the flight of the bees, as they flew from 6 A.M. to 7 P.M. so heavily laden, they would sometimes fall in front of the hive, and rest before crawling in.

### DISTANCE BEES FLY.

But my bees are the far fliers. I have been satisfied for years that bees will fly 8 miles when honey is scarce nearer. As further evidence, B. F. Little, of Brush Creek, is the only bee-keeper near us having the Italians. Now, his apiary is poorly shaded, and he lost heavily by runaways. These absconding Italians have been found in trees, etc., by bee-hunters, over ten miles from Brush Creek. I have made some inquiry of several bee-hunters. Four swarms of Italian bees have been found in the timber near Fayette, ten miles from Brush Creek, all new

swarms; no bees winter here in hollow trees, only during light winters.

The past winter was very severe on bees. Some bee-keepers have lost all; others, half. Three of the largest bee-keepers in our county came out with but a light loss—not over ten per cent. We have an old box-hive bee-keeper in Fayette who has been successfully keeping bees, and made money at it too; he likes to read GLEANINGS, but says he knows all there is worth knowing. I think he could tell us bee-keepers a great many things, if he could be induced to write. He says he never lost a new swarm by absconding, and I think he said one never came out of the hive he put them in. He has had at one time as high as 300 swarms.

### IMPORTANCE OF SHADING NEW SWARMS.

His strongest point regarding absconding swarms is good, perfect shade, and plenty of air. He raises all new swarms nearly one inch off the bottom-board. The sun does not shine on his new swarms. He set his shade trees here and there nearly 20 years ago, and they are quite large. No small shrubbery is near the bees. Trees are well trimmed. It is cool and airy at all times.

I used to lose from two to ten per year that would abscond to the timber; but by giving more air and better shade, not one swarm has left a hive in three years; and last year we had 38 first swarms, and nearly twice that number of after-swarms.

FRED TIMMERMAN.

Fayette, Fayette Co., Iowa, May, 1883.

I am very glad to get your report of honey from the willow, friend T. I have many times wondered why our willow hedges could not be utilized in a way to make them a valuable adjunct to our honey resources. We have willow hedges here, but they don't seem to be the honey-bearing kind. In regard to the distance bees fly, I think a distinction should be made between bees going in search of stores, and the flight of a new swarm, as a swarm of bees with their queen would probably go much further than bees would ordinarily go in quest of stores. I can hardly agree with you, that bees never winter in the timber in any locality. We have had so many reports of occasional colonies wintering with very poor protection against the weather, that I should be inclined to think that they sometimes, at least, wintered in trees, even during the severest weather. I am also inclined to think that a colony of Italians will locate in a tree, and send out swarms very often the first season. Bear in mind, we have a good many reports now of first swarms sending out a good many swarms during the first season, and in this way Italian blood would travel a good way, even in one season. Your remarks on shade are good. Many swarms leave their hives, without any question, simply because they are too warm. In putting up bees in our wire-cloth cages, we have ample evidence of the importance of shade and plenty of air. A few days ago our apiarist put a pound and a half of bees in a cage intended for one pound. As the day was cool, he thought there would be no trouble; but the mass of bees, filled with honey, soon raised the temperature to such a pitch that they would all have died, perhaps, in ten minutes, if left under the full rays of the sun. We

hung them up in a shady doorway where a strong breeze was passing through, and the temperature was soon down to the normal condition of a cluster of bees. Had a new swarm been in this predicament, they would assuredly have decamped, simply because they must do so to save their lives. Please remember, friends, in handling swarms during hot weather, when they are full of honey, to give them a great abundance of air, and keep them out of the sun.

### DOES A SWARM EVER GO OFF WITHOUT CLUSTERING?

AND SOME OTHER MATTERS AS WELL.

**I** SEE in your May issue that Mr. Foggy seems to advance the idea, that a swarm never issues and goes for parts unknown without first clustering, or settling, as we may choose to call it. I must say that his experience in the swarming line does not correspond with mine, for I can at this moment call to mind at least three swarms which issued from the parent hive, and started for forest homes, and that without clustering. Probably Mr. Foggy would say that I might not have seen them issue; but I did, for I was on hand at the time. One of the swarms, I succeeded in capturing after I had given about a half-mile chase; the other two made their escape to their chosen home, for aught I know.

LARGE ENTRANCES GIVEN AGAIN AS THE CAUSE.

I have noticed, in my experience in swarming, that those colonies with large entrances are the ones which occasionally play such tricks. I think it unnecessary to make any big hurrah, or beat drums, tin pans, etc., for they will settle just as readily without the noise. I will give you my method for settling swarms when they are not inclined to settle readily, and you can take it for what it is worth.

SETTLING THEM WITH A LOOKING-GLASS.

When I have a swarm of bees, and they have no disposition to settle, I get a looking-glass, if it is to be had, and hold it in the rays of the sun so that the reflection caused by the sun shining on the glass can be thrown among the swarm. The reflection should be kept wavering among them until they are so dazzled that they will alight on the first thing that comes in their way. If the sun is not shining brightly, the glass will be of no service. This may be old to most bee-keepers, but will prove a success if executed properly.

DO FIRST SWARMS EVER ISSUE WITH MORE THAN ONE QUEEN?

In 1879 I had a swarm issue from the old stock, accompanied by two queens. I supposed that it was the old queen and daughter. On the day of issuing I hived them, and in doing so I caught a queen and clipped her wing. The next day the same swarm came out again, this time accompanied by a new queen with a good wing. I forgot to state, in the commencement, that this was a first swarm.

DO BEES CHANGE EGGS FROM ONE FRAME TO ANOTHER, TO REAR QUEENS?

In the fall of 1882 I had a case where eggs were changed from one frame to another, to raise queens. The colony had previously become queenless, and no brood was in the hive, until a frame of brood, or eggs, rather, was given from a choice queen, and in four or five days there were queen-cells with larvæ

on some two or three different frames within this hive, all formed by those bees.

THE DRONE THEORY, AGAIN.

I have had two different cases in which drones were reared from worker brood or eggs. I know some will be ready to take exceptions to this; but then, it should be in a friendly way, while we are aware that necessity alters cases. In August, 1882, in the latter part of the month, a queenless colony was given a frame of brood from which to rear a queen. There was no drone comb on the frame, but yet they capped a part of it as worker and the rest as drone, except the royal cells. I took notice of them at the time of hatching, and a part of those cells which were capped as drone brood hatched out worker progeny, and the remainder the opposite. And again in April, 1883, I had a case of worker eggs changed to drone; but this time every cell that was enlarged, proved, on examination at time of hatching, to be occupied by a drone. In neither of those cases was there any brood which was left in the native hive treated in like manner; so in my experience in bee culture I can not help thinking that the worker bees have the power of changing the germ of the worker eggs to that of a drone.

HONEY FROM BUCKEYE.

Bees are booming at the present. They are rearing brood in abundance, and there is quite a flow of honey at the present time. They are getting the most of it from the buckeye bloom. It has a peculiar flavor, but I like the quality of the honey.

Jordan, Ind., May 19, 1883.

A. L. LINDLEY.

### ARE WE SURE THAT STRONG COLDS ARE KILLED BY EXPOSURE?

WHERE DOES THE TRUTH LIE?

**T**O show that bees will endure long-continued, intense cold below zero, night after night, for a considerable period of time, I will relate the following: I found one colony in my apiary in March, after the snow was gone (as I did not look at them during winter, nor, indeed, since the honey was taken off, about the 10th of Sept., for I then fixed them for winter), in a Simplicity Live with nothing above the frames but a half-story and cover (with the usual number of knot-holes in the cover, as you make them). This was one of your make, and had one hole  $\frac{1}{2}$  inch in diameter, in and out of which the bees flew when it was warm enough, and probably out, *sometimes*, when it was not. The half-story I made myself, and it was not made to fit the cover; but the top of the sides and ends was left flat, just as the saw left them, and consequently the cover did fit very well; and the lower story, also, was of my make, and the joint just as flat as the saw left it. The only part you made was the cover and 10 frames.

When I opened it I was much surprised to find it in that shape, and to find it full of bees, and in fine condition, with plenty of brood for that season of the year, but with their honey nearly all gone, which shows that their exposed condition had caused them to consume an unusual amount, as it had 10 frames, which undoubtedly were well filled in the fall, while others with only 8 frames were pretty well supplied with sealed honey on March first, which, on looking, I find to be the date of the examination. I at once procured a box containing about 8 lbs. of honey, it

having one comb broken out of center, and placed it on the frames, and then covered them with a quilt, and made them as snug as possible in that way; and to show how vigorous they were they at once went to work and built a new comb in the new place of the broken one, and this in *March*. I did not look for the queen in particular at this time; but soon they began to dwindle, and two weeks ago I saw that there was not so much brood as there had been. I looked for the queen, but did not find her; but instead I found two queen-cells near the center of the hive, and last week I found a young queen, and the bees reduced to a double handful. When I first found them destitute of a mother, I sent to you for a dollar queen, but she has not arrived yet. It is doubtful whether I can save them. There are still young bees hatching, so that it can not be very long since she disappeared. Was it the exposed condition in winter, or the careful nursing in spring, that caused the loss? I am sorry, for I thought I had proved something.

J. F. TEMPLE.

Ridgeway, Lenawee Co., Mich., May 21, 1883.

### REPORT FROM O. O. POPPLETON.

#### IMPORTANCE OF WINDBREAKS IN WINTER.

I REACHED home two weeks ago, from an absence of about six months in the South, and found my bees had wintered very poorly; that the losses in my apiary were more the past winter than the aggregate of all losses for the previous 9 or 10 winters. Out of 151 colonies last fall, I now have about 75 good ones, and some 10 or 15 fair and poor ones, making a loss of about 40%. All were in chaff hives. As we sometimes learn our best lessons from our failures, I will give what I find, after thorough investigation, to be the circumstances which seem to have caused my loss. Of course, I have depended a good deal on what my assistant tells me, who has charge of the bees during my absence.

I find the winter has been the coldest and steadiest that Northern Iowa has experienced for nearly 20 years past, and that at one time the thermometer was near and below zero for about six weeks continuously. My assistant informs me that the snow entirely covered the hives in some parts of the apiary, while in other parts the ground was swept almost entirely bare, and that the bees that were covered with the snow are nearly all alive, and doing well, while those that were not so covered are mostly dead. He also says that some of the dead colonies showed signs of dysentery; but the most of them were dry and clean, both bees, hives, and packing, which statement is fully confirmed by my own investigation of hives since coming home. I also find more queenless colonies than usual.

Last spring I grubbed out a patch of brush and small timber that partly protected the north-east corner of the apiary, and I find that nearly every colony in that corner is dead, and that fully three-fourths of all the dead colonies are in the east half. I also find that my neighbors who winter on a similar plan to my own have succeeded the same as usual, the only serious loss that I have heard of in chaff hives being my own.

It seems to me that the foregoing facts leave but little opportunity for a difference of opinion as to what were the prime causes of this heavy loss — the long-continued spell of very cold weather, which it was utterly out of our power to prevent, in connec-

tion with the fact of a part of the apiary being left fully exposed to our prairie "blizzards," which last I could and ought to have prevented. I am fully satisfied, that if I had surrounded the exposed corner of my yard with a high tight board fence, that the loss of bees would have been insignificant, and I have already made arrangements for the growth of an evergreen hedge around the exposed part.

A young friend who lives on the open prairie has never succeeded in wintering his bees during hard winters, although I knew from actual examination that they were properly packed. The reason why he alone was unsuccessful has heretofore puzzled me; but this winter's experience explains it all.

I think some lessons can be learned from this loss, the most important one being that, to secure success in outdoor, or, in fact, any other method of wintering, we must attend to every detail that experience teaches us is a help; not alone to the more essential details, but to every detail that is a help; also that bees must have the aid of some kind of surroundings that will break off the full force of our vigorous winter winds.

A few other facts I have noticed. Some 40 or 50 of my queens were bred in the South; but I can discover no difference in their wintering qualities, compared with Northern-bred queens. Hives that are protected on bottom as well as sides and top, have come through dryer than those having unprotected bottoms; but I do not see that they have wintered their bees much better. I do not feel that the plan of chaff-hive wintering is at all in fault for this loss of mine, but it was caused by an inexcusable blunder of my own in removing one of the means of protection against high winds, without replacing it with something else equally efficient.

O. O. POPPLETON.

Williamstown, Iowa, May 17, 1883.

### BEE CULTURE FOR STUDENTS.

#### FROM 1 TO 3, AND 100 LBS. OF HONEY.

I BEGAN bee-keeping last spring with one swarm of hybrids. They gave 100 lbs. of honey, and multiplied to three strong colonies. October 1st I packed them in chaff in dry-goods boxes. The entrances were left open, and provision made for upward ventilation. Two are now in fine condition, and still in the boxes. The other swarm, near spring, crowded into a corner, and, as I think, starved. How can this be prevented?

I am a young man intending to go to college as soon as I get the means. Do you think bee-keeping could be made a help while pursuing the course?

Lyle, Minn., May 12, 1883.

FRED CLOW.

I do think, friend Fred, that bee-keeping is one of the best things in the world for a young man intending to go through college. Very many of our most successful boys in bee culture are college boys. Mr. House is one of them, but he has gone home to work with his bees this summer, and will resume his studies in the medical college in Chicago in the fall. When through, he is going as a missionary physician to Africa. Not only will college students succeed better, other things being equal, but the outdoor work that the bees require is just the best thing in the world for students to keep up their physical health. May God's blessing rest on the bee-keeping students of our land!

## A FAMOUS HONEY-PLANT.

THE CALIFORNIA SAGES.

**N**OTICE in this month's GLEANINGS that one of your California correspondents takes exception to the many strange names that have been given to the white sage. He should have also added that it has been unfaithfully illustrated in "Cook's Manual," the A B C, and in the B. K. Magazine. I send you a copy of the *Pacific Rural Press*, which has the only true representation of the leaves and flowers of this plant. 'Tis true, it might have been better; but when it is known that it was taken from flowers picked in my garden in December, it can be seen how fine a plant it may be made.

N. Temescal, Cal., April 7, 1883. W. A. PRYAL.

Not only is California famous for its specimens of vegetable growth of huge proportions, but also for some of much less imposing appearances. Among the latter there is no plant that has made this State more renowned than has the white or honey sage of Southern California. Hardly ten years ago it was looked upon as a useless shrub, scarcely fit for sheep to browse upon. Since then the honey-bee has made it famous. When it became known that honey flowed from the flowers of this plant, as it was never known to do even in old Greece, and of a quality far superior, thousands of colonies of bees were located in the sage region. During our favorable years these bees gathered the honey from the flowers about them in such large quantities that many an ocean craft was weighted down with the nectar.

To all parts of the world has this delicious article been sent, and everywhere it has secured for the place from whence it came, praises that no other honey-land ever received. Besides the good words this State has obtained by its excellent honey, the people have received thousands of dollars which would never have entered the State if the nectar were wasted on the desert air, or if the plant in question did not exist in our midst.

THE FAMED HONEY-PLANT, THE WHITE SAGE OF CALIFORNIA.

The cut herewith shown gives a fair representation of a part of the stalk, the leaves, and a single flower of the white sage, the flower being enlarged to show its peculiar form. It belongs to the genus *Audibertia*, of the order *Labiata*, to which also the garden and other sages belong.

These plants are of great value as bee pasturage, as they are of easy growth, will thrive on drier soil than most other honey-secreting plants, and their

season of efflorescence continues many weeks. The writer has cultivated the white sage in Alameda County, near Berkeley, and as a result he finds that it thrives remarkably, growing luxuriously on cultivated soil, and producing an abundance of bloom. It is a plant of which every apiarist should disseminate the seeds as much as possible, so that in the course of a few years large patches of the plants may be found in the hills and valleys in various parts of the State. By doing this, such a thing as a short honey crop will hardly ever be known.

The Rev. J. C. Nevin, of Los Angeles County, in writing of the sages lately, says: "There are at least half a dozen species of *Audibertia* on the coast, included under the popular names of 'white' and 'black' sage. The 'white' (*Audibertia polystachya*) differs very much in the form of inflorescence from all the others, and from that of the genuine sage. Its whole appearance makes it a rather striking plant, and, when once known, to be easily recognized anywhere. Its range extends from Santa Barbara to San Diego. All lovers of the beautiful white honey gathered from its flowers ought to know and regard it with feelings of gratitude.

"'Ball,' 'button,' or 'black' sage, is undoubtedly a common name for several distinct species. Their general habit is much the same, whilst ordinarily the specific distinctions may not be so obvious. The whole appearance is more nearly like the true sage than is the 'white,' above mentioned. Of the number, *A. stachyoides*, *A. Palmeri*, and *A. Clelandi* are very closely allied and most difficult to distinguish. *A. stachyoides* ranges from the Contra Costa Mountains southward, while *A. Palmeri* and *A. Clelandi* are confined to the southern part of the State. Just what precise form prevails around Los Angeles has not as yet been definitely settled; but it is mostly near to, if not identical with, *A. Palmeri*, the typical form of which is found in San Diego County."—*Pacific Rural Press*, Jan. 13, 1883.

## CAN BEES FLY NINETY MILES AN HOUR?

SOMETHING FURTHER ON THE SUBJECT.

**O**NE of the most dangerous sources of fallacy is arguing in regard to matters concerning which our knowledge is incomplete. In the May No. of GLEANINGS, Mr. Shuck takes Mr. Doolittle severely to task for asserting that his bees can fly ninety miles per hour. Mr. Shuck doubts this statement, because a wind blowing ninety miles an hour would blow Doolittle's hives out of his yard like so much chaff. Granting the latter assertion (which, however, has not been proved), it does not necessarily follow that bees can not fly ninety miles an hour, for we have other facts equally strong to prove that they can. The wild duck has been known to fly ninety miles an hour — its speed having been measured by the electro-chronograph. The pigeon has been known to exceed ninety miles an hour for short distances. The question now is, Is the power of flight of the bee equal to that of the duck or pigeon?

Many years ago we experimented very carefully on this subject. We found that very few pigeons could carry their own weight in flight. Ducks we could not procure under suitable conditions. Bees easily carried their own weight, and sometimes even  $1\frac{1}{2}$  times their own weight; showing that they were proportionally much stronger in flight than pigeons. And as our method of loading was more clumsy with the bee than with the pigeon, we believe that two to one in power is nearer the mark. If this be so, there can be no *a priori* objection to the speed given by Mr. Doolittle for the bee, if the pigeon can make 90 miles. It will be very difficult to time the bee, on account of the difficulty of seeing it. It might be timed by marking individuals as they fed, and timing them with good watches. Bees with a spot of red, yellow, white, blue, and other marked colors

might be timed; but the difficulty would be to get them up to full speed. When just starting, and when nearing home, they fly very slowly, as is easily seen. But a bee slowly making its way to the entrance of the hive has a very different motion from that of one with its anger aroused, and making for its victim. A bee which has just made up its mind to "make an opening" for itself, and flies to its work, goes, we should think, at a rate which can not fall far short of Doolittle's estimate. That very few bees make ninety miles per hour in going from their feeding-grounds, will, we think, be generally conceded.

JOHN PHIN.

Cedar Brae, N. J., May 7, 1883.

Now, friend P., I can't agree with you, that it is very dangerous for those to write on a subject whose knowledge is incomplete, as you express it. My knowledge is quite incomplete in the matter; yet on another column I have hazarded the opinion that bees do not ordinarily fly over 10 or 15 miles an hour. Perhaps I am mistaken, and may be I am very badly mistaken; but for all that, I think it is a good thing for us to compare ideas in the matter. You have given us important facts, and so have others; and I feel that some one will, ere long, give us some accurate experiments that will settle the matter about as conclusively as friend March settled the matter in regard to how far bees fly.

#### REFINING BEESWAX.

SOME VALUABLE HINTS FROM A PRACTICAL WAX-REFINER.

**MR. RICHARD MERKLE**, of St. Louis, Mo., has kindly given to the bee-folks the following valuable facts in regard to cleansing and purifying the wax of commerce. We feel the more grateful to him, because it is so unusual for practical workmen in any branch of trade like this to communicate so thoroughly and so willingly the secrets of the trade, as it were:—

Yours of the 27th ult. is at hand. To refine, say 200 or 300 lbs., take an empty oil-barrel open on one end as a stand, and a half-inch copper steam-pipe, to reach within an inch of the bottom, is the apparatus. Set your stand in place; screw on the steam-pipe; pour on one or two buckets of water, enough to bring the mouth of the pipe into the water, and put in about ½ lb. of sulphuric acid, enough to acidify the water. Now let on steam, and fill up with wax. Let it on freely till melted, and the molten wax is thrown up with foam, to bring it to boiling, or 212°. Then unscrew the pipe and let the wax rest till perfectly settled and cooled off—say 3 hours; dip out slowly till you come down to the sediment and water, and let this cool off till next day, and take out what is left, for next melting. The sulphuric acid is what will cause the wax to settle well; but if you have dark black wax, which you may refine by itself, then after going through the operation as above, while the steam is yet on, and the wax well agitated, a few drops more of sulphuric acid, and the color will change immediately. A little practice will tell you how much acid is needed. In putting acid into the boiling wax, the mass becomes rather thick and milky, and if not liked it may be dipped over into another stand, which also must have the acidified water, as if commencing.

I think I have made the explanation so that you will easily understand it; sulphuric acid before melting, if only to make a clear melting, boiling, or 212° heat, and settling for several hours.

St. Louis, Mo., May 4, 1883. RICHARD MERKLE.

Our friends will observe that the above plan is not very much different from the one we have adopted for cleansing wax and rendering combs, only that friend Merkle uses sulphuric acid, while we use none. I would suggest that the process be performed out of doors, for the slop and spatter attending it is not very pleasant inside of a building. In melting wax as we do, by steam-pipes, the impurities settle on the pipes and the bottom of the cans. These are taken out and put into a hogshead; and when this hogshead is filled we put them through the same refining process as described above, and therefore get quite a quantity of dark wax, which we use, as you may have noticed, for making the second grade of fdn., to be used only in the brood-combs. We will make a test of sulphuric acid, and report when next we have some to render over.

#### A GOOD REPORT FROM CANADA.

**A**FTER all, there was no reason for the beginner to have been nervous, as he told you last January. His bees were all in chaff hives, with a kind of Hill device over the frames, a quilt, then a chaff cushion, and two inches of sawdust. Bees crowded on six or seven frames, with two division-boards, and empty space filled with buckwheat chaff. The winter was very cold, frequently 20° below zero, and snow drifted six or seven feet over the hives. Bees are all right now; plenty of honey to last till fruit-bloom; they are carrying in pollen, and lots of brood; they have not had more than a dollar's worth of food since this time last year. You ought to see them swarming around the crocuses and snowdrops, which bloomed almost as soon as the snow was off.

FROM 2 TO 7, AND 220 LBS. OF HONEY.

I got seven colonies out of two, besides one in the woods, and 220 lbs. of honey. Not so bad for a poor year; and all wintered safely—that's the best of it. There appears to have been considerable loss among apiarists hereabout. The old-fashioned box-hive men have mostly empty boxes of combs, as the result of not being up with the times.

Prospects are excellent for this season. Clover was protected by the deep snow, and not killed by the frost, as often happens.

WHY DOES A GOOD QUEEN LAY SEVERAL EGGS IN A CELL?

What is the reason a young queen, hatched last July, lays two or three eggs in a cell? She has quit such foolishness now, and settled down to straight business.

HOW TO USE FOUNDATION.

How would you advise, so as to use a small supply of fdn. to the best advantage? It is high and scarce here, as elsewhere. I shall run principally for extracted honey.

C. W. YOUNG.

Stratford, Ont., Can., Apr. 19, 1883.

Your young queen laid several eggs in a cell because the cluster of bees with her was too small to prepare as many cells as she was capable of filling. I presume she was

energetic, and didn't want to be idle, so she went around the second or third time after she had filled all of her cells. When young bees are hatched out so as to make her retinue larger, of course she had no need of so doing, and "stopped such foolishness," as you term it.—I would use a small quantity of fdu., by cutting in strips and using it for starters. The larger the starters, the more time you will save the bees.

## Bee Botany.

### OR HONEY-PLANTS TO BE NAMED.

WASN'T IT A MISTAKE?

IN last GLEANINGS, Fr. Holtke, p. 123, speaks of *Poinciana pulcherrima* (pulcherrima means beautiful), a leguminous plant closely related to partridge pea, and really describes the beautiful poinsettia of our greenhouses (*Euphorbia pulcherrima*) which belongs to the *Euphorbiaceæ* family. Poinsettia is very showy, and each flower has a large yellow gland which is cup-shaped, and always full of nectar. This plant is a native of Mexico. I have often thought that its habitat must be the paradise of the bees and apiarist.

A. J. COOK.

Lansing, Mich., Mar. 8, 1883.

Many thanks, friend Cook, for the valuable information you give us in this matter; but are you not afraid so many great hard words in just one little short letter may discourage some of our younger ones, to say nothing of the rest? The mistake was ours, not friend Holtke's, as explained in our last issue.

#### THAT HONEY-BEARING HONEYSUCKLE.

I send you the bloom of that honeysuckle, and will mail you by this post a plant of the same. You will observe by the bloom that it forms bunches, and these bloom out in succession, keeping the plant covered for about 4 weeks. It was covered with snow about 3 weeks ago, but it did not hurt the bloom. As soon as it melted, the bees covered it. Perhaps it may be a good spring bee-feeder.

F. L. WASHINGTON.

Nashville, Tenn., April 4, 1883.

Answer, by Prof. Lazenby:—

The plant from F. L. Washington, Nashville, Tenn., was received in bad condition for identification. All of the flowers were broken off, making it very difficult to name the plant with any degree of certainty. I judge it to be a species of *Diervilla*, or "Bush Honeysuckle," belonging to the *Caprifoliaceæ*, or Honeysuckle family. It is probably *Diervilla triptida*. It is a shrubby plant, not uncommon in hedges and thickets, and receives its generic name from *Diervilla*, a French surgeon, and the discoverer of the original species. Although the species mentioned above is not as fragrant as some species of the *houteera*, it is much frequented by hummingbirds and insects, and probably contains much nectar. The specimen was so badly broken that there is no living left worth returning.

WILLIAM R. LAZENBY.

Columbus, O., April 17, 1883.

#### VETCHES FOR BEES.

I send by mail some specimens of vetch, which flourish well in this country, and are fine for bees,

Please have it analyzed for me. Can you tell me where I can get the seed in quantity? I can not get it here.

W. S. LOGAN.

Keatchie, De Soto Par., La., April 16, 1883.

The plant is *Vicia sativa*, L.; common vetch, or tare; a plant formerly much cultivated here, and still held in high repute as a fodder plant for cattle in Europe. It was introduced from Europe, and is now generally regarded as a weed in the U. S. The following is a description of the plant. An annual with a simple stem and compound leaves; the leaflets in 5 to 7 opposite pairs, obovate, oblong to linear, mucronate; flowers bluish-purple, mostly in pairs, sessile. Fruit a long, several-seeded pod. The plant trails one to three feet, or climbs by the tendrils on the ends of the pinnate leaves. Leaflets,  $\frac{3}{4}$  to  $1\frac{1}{2}$  inches long. Flowers axillary.

W. R. LAZENBY.

Columbus, O., April 27, 1883.

#### THE MESQUITE-TREE OF TEXAS.

The mesquite-tree of Texas, one that yields the "mesquite-gum," is the *Prosopis glandulosa*, sub-order *Mimosæ*, order *Leguminosæ*. It grows from 20 to 40 feet high, attaining a diameter of 18 inches. It is said to grow where no other fruit-tree will live.

Columbus, O.

WM. R. LAZENBY.

#### ANOTHER HONEY-BEARING SAGE.

I inclose a sample of plant we call wine, or foliage plant, that the Italians seem to like just now as well as catnip or motherwort in fore part of season.

Marietta, O.

MARIA L. DEMING.

The plant sent to you by Maria L. Deming, Marietta, O., is evidently a species of *Salvia*, a well-known genus of plants belonging to the order *Labiata*, or Mint family. It is undoubtedly *Salvia variegata*, which is often grown as an ornamental plant. It is quite readily propagated by seeds or cuttings, and is quite closely allied to the common garden sage. Nearly all of the *salvias* are handsome flowering plants, some of them being hardy and herbaceous, while others are more tender, and assume a somewhat shrubby character. The name "salvia" is from a Latin word, *salveo*, meaning, to be in health; probably in allusion to the salutary qualities of the sage.

WM. R. LAZENBY.

Columbus, O.

#### WINTERING BEES ON A LARGE SCALE.

SUCCESS UNDER CONDITIONS APPARENTLY OPPOSITE.

AS there so are many controversies regarding wintering bees, I think I will give a few facts that have come under my observation in relation to the matter. In the spring of 1882, wishing to purchase some bees, I made a visit to the apiary of Wm. Denison, of Gowan, Mich., who keeps his bees in box hives. He had removed about 200 hives from his cellars a few days previous. He had wintered with trifling loss at that time, although I was informed that he lost nearly one-third afterward during a cold spell, and after the bees had gathered natural pollen. His cellars were built in a very dry, sandy place; the earth in the bottoms was so dry that it was dusty.

I also visited the apiaries of J. H. Robertson, Pownam, Mich., the same day, who had also just removed his bees from bee cellar or cave. He had some 400 colonies, which were in good shape. His cellar was the reverse of Mr. Denison's, as there was a considerable amount of water in the bottom, and

Mr. R. informed me that he had stored a quantity of ice in one end during the latter part of the winter.

I can give also another instance of bees wintering under opposite conditions. This winter, which has been a very hard one, about the middle of March, I examined some bees owned by a Norwegian, whose only knowledge of bees was that they would sting. Six colonies were placed on shelf in a cellar; the whole cellar bottom was covered with potatoes, there being some 700 bushels of them. He told me that he had one hive he could not get into the cellar, as they stung so badly, and he let them stay out. They were in a two-story hive, with cap on. Where the two stories came together there was a large crack which had been filled with fragments of paper, but hardly served to keep out cold air; and yet the inmates seemed to be in good condition. The colonies in the cellar were very strong.

S. J. YOUNGMAN.

Cato, Montcalm Co., Mich., May 13, 1883.

### ODDS AND ENDS, FROM DOOLITTLE.

#### PARAFFINE FOR FOUNDATION.

**O**N page 186, April No. of GLEANINGS, you wish those who experimented with fdn. made from paraffine, and used it in sections several years ago, to speak out and tell how it worked. As I used several pounds of it, and lost several dollars for every pound used, perhaps it might be well to speak of it as a warning to others. At first I placed a few sections on the hives filled with paraffine fdn., to see if the bees would accept of it readily. As they did so, more was put on, and I soon was exultant over the nice white combs, all sparkling with honey. Soon the bees had it nearly all sealed over, and I expected the next time I went over the bee-yard to take off honey, to have a fine lot to come off, as this did look so nice, capped so white and nice from  $\frac{1}{2}$  to  $\frac{3}{4}$  the way down the sections. Just before I was to take it off the hives, there came two days in which the mercury rose from  $95^{\circ}$  to  $97^{\circ}$  in the shade; and upon going to the bee-yard I found the bees to these hives having the paraffine fdn. over them, all daubed with honey, and honey running out at the entrance. An examination showed that nearly every section filled with the paraffine fdn. had been ruined, as the fdn. had so sagged that it lay in a mass at the bottom of the box, while those having natural comb in them had not been damaged in the least.

#### SMALL BROOD-CHAMBERS.

On page 190, same number, J. Woolsey wishes to know how many feet of comb I give my bees when I put on sections. I generally use 9 Gallup frames, the combs in which are about  $10 \times 10 \frac{1}{2}$  inches square. This gives about  $6 \frac{1}{2}$  square feet of comb, surface measure. Sometimes I use only 7 or 8, according as I get them filled with brood when the honey-harvest comes on. I desire to have as much brood in each frame as possible, yet there is generally some little honey and pollen in the upper corners of the frames. If I get to the amount of 7 full frames of brood in 9 frames, I call it pretty good. If there is not that amount, I use fewer frames so as to get the first honey put in the sections; for upon this depends our crop of section honey to a large extent.

#### POLLEN PRODUCING DYSENTERY.

On page 191 I find these words: "Brood-rearing and its attendant consumption of pollen is without

question one great cause of dysentery." Now, I wish to ask what is the cause of undue "brood-rearing and its attendant consumption of pollen"? Is it the pollen a hive contains? If so, the more pollen the more fatal the result, would be the natural conclusion. This I do not find to be the case after careful examinations. Now, *candidly*, I do not think that pollen has any thing to do with the first cause of our wintering troubles. I have made careful examinations the past winter to see if I could get any clew to what caused dysentery and loss of bees in winter. As I have lost 11 colonies, and have others mere remnants, I had some chance to experiment. I find that some colonies will keep in a normal condition for 5 months without a flight, while others will not so keep for more than 2 to 3 months. As long as the colony keeps quiet and compactly clustered, they are all right, and I believe some few colonies would so keep on their summer stands, if winter held them inside their hives for 7 months. Now the question comes, If a few will do thus, why not all? What causes a part of our stocks that get the dysentery, and die, to do so? I wish I were able to answer this; but as I am not, I will give an item or two showing that brood-rearing and pollen is not the first cause. Soon after Christmas I observed, upon taking a peep into my colonies, as I often do on mild days, that two had become uneasy, and had broken the cluster. At this time no brood-rearing had commenced, and no pollen been consumed that I could detect. By raising them up at the bottom I succeeded in quieting one of them; but on the other it had no effect. In about two weeks, another mild day occurred, and an examination showed a little brood started in the still uneasy colony, while the other, being quiet, was let down on the bottom-board again. In a week I found that this last was in commotion again, so I raised it up the second time. The other had a large lot of brood, and had begun to consume pollen to feed the larvae, while the one that seemed to be quieted by raising the bottom-board had no brood, and had used no pollen, that I could detect. To make a long story short, after rearing brood in four frames, and using a large quantity of pollen, the one colony died, while the other is still alive, and a fair colony to-day. In all the 11 that have died, I have observed that the confinement necessarily attending a cold winter causes the abdomen of the bee to become distended with excrement; a desire seizes them to get out; the cluster becomes broken up, after which brood-rearing is started quite extensively, in the vain hope to thus keep their numbers good, by replacing those which are dying daily, till the bees are worn out by this constant restlessness, while those hatching can not battle with the cold, and thus all perish together. If pollen and brood play a part in this matter, it is only a secondary part, in my humble opinion. I still believe confinement in relation to the stores is where the trouble lies. For further reasons why I believe so, see page 76 of GLEANINGS for 1875.

#### THE COMING BEE.

I was much amused in reading friend Secor's article on page 240, May GLEANINGS, headed as above, for he brought to my mind very vividly similar scenes through which I had passed, setting bees out of the cellar. Now, friend S., unless you wish to amuse your wife in that way again, just set a cover or bottom-board of a hive just outside your cellar door, and upon this set your hive of bees as you come out of the cellar. Have your lighted smoker handy

by, and blow a few puffs of smoke under the hive, when you can carry them where you wish, without performing as you did before; for the bees will not attempt to fly out and sting for a minute or two after smoking. Of all the bees to sting, one that leaves its hive on carrying out of the cellar is the worst. As they have no place to go to except to hang around where they left the hive, they will dart at you for an hour after, and every time you pass that way. This applies only to those who use loose bottom-boards; for with a tight bottom-board the bees can be shut in their hives while carrying from the cellar.

#### SWARMS GOING OFF WITHOUT CLUSTERING.

On page 243 you ask those who have seen first swarms go off, to "stand up and testify." Years ago, when I was about 12 years old, father kept bees, and I was the one to watch for new swarms, calling father from the field to hive them. Just before dinner one day a large first swarm came off, and before they were all fairly out of the hive they began to move off to the north of the house, where there were no trees. Father had just come home for dinner, and seeing them going in that direction he told me to ring the bell louder (our custom then to stop swarms), and he took to beating a pan. Thus we followed them for half a mile, when, tired and out of breath, we gave up the chase, and let them go. I have also had one such attempt since I kept bees; but as the queen's wings were clipped, they came back of course.

#### DEATH STOPS ALL PLANS.

On page 250 you say, "Set the man whom you could not get the bees to sting, at work among the bees day after day." I would have gladly done so, but death, that destroyer of all living, removed him from our neighborhood shortly after this. As he was nearly 80 years old, and testified to never being stung in his life by a honey-bee, and as I could not get him stung (also knowing that he kept bees for nearly 20 years), I have believed that there was at least one person whom the bees would not sting. I confess to being a little wicked in trying to get him stung, but I was anxious to see if what he said was really so.

G. M. DOOLITTLE.

Borodino, N. Y., May 12, 1883.

But, friend D., you don't say whether you used pure paraffine, or paraffine and wax. My experience has been just about what you give, with pure paraffine, and I gave the result years ago, when I first made the experiments. We have some of the same kind of trouble where the paraffine is part wax, even three parts wax and one of paraffine. But it has been suggested that about the latter proportion would stand the heat, providing it were stayed with wires. The reasons you have given are sufficient. I should think, to deter any one from wanting to make experiments with paraffine for comb honey. Comb honey breaks down fast enough as it is. Within a few days, Ernest has been making some experiments with samples of paraffine sent us to test; but so far, we can find nothing that has the rare property possessed by beeswax, of standing a very high temperature, without melting. Paraffine has two objections: when cold it is more brittle than wax; it also melts at a temperature where wax would have considerable tenacity. Very likely we shall be obliged to hold on to the wax made by the bees, for all time to come.

By the way, it seems to me your experiment in raising the hives up in the cellar demonstrates the advantage of more ventilation; and why will not abundant ventilation keep bees quiet, and stop the dysentery? Very many times in years that have passed, one after another has recommended wintering bees without any bottom to the hive, so that the dead bees could drop clear down out of the way, and then abundance of air might always have access from below. Why has this plan been dropped? Is any one practicing it yet? Of one thing I feel pretty sure, that very many cases of losses out of doors and in cellars would have been saved by a freer circulation of air — hives "cracked from top to bottom," for instance.

#### PATENT IMPOSITIONS.

SECTIONAL HONEY-BOXES INSIDE A WIDE FRAME.

WHILE the present system of issuing patents is maintained, it is well for the public to be on guard. Patent solicitors make their fees regardless of real merit in a supposed invention; and if the examiners are led to believe that the law is complied with, patents are issued, even on old and obsolete ideas. This has often been done. Applicants are now allowed patents on the most trivial claims; and repeatedly instances have been given where the claims are not only not original, but are known to have been before made, and being unappreciated have dropped out of use.

Now, regarding the claims for the use of the wide frames as patented. It is absurd. I have myself made them longer than the life of a patent. For one, I am willing to contribute to a fund to be used to defend against any such fraudulent claims.

J. W. PORTER.

Charlottesville, Va., May 17, 1883.

I believe you are right, friend P., and the case you have alluded to well illustrates the point. In regard to sections in large frames, friend Baldrige sends us the following:—

#### SECTIONS IN LARGE FRAMES.

I have read in GLEANINGS for March and May what you and H. H. Flick, and others, have to say about the use of sections *inside of frames*. I have an old scrap-book of items and articles relating to bees, made by me prior to 1860, in which I find many interesting facts when peculiar circumstances arise. I will inclose you to-day some illustrations, with accompanying description, taken from the *American Agriculturist* for 1858 or 1859, concerning the use of sections in large frames, and patented Nov. 9, 1858, to Ebenczer W. Phelps, of Elizabeth, New Jersey. When I came to Illinois, in 1861, I found here quite a number of Phelps' hives, supplied with sectional frames, in common use. These facts should, therefore, allay any excitement in regard to Mr. Flick's blackmailing threats. The matter preceding the illustrations was taken from an advertisement, as before stated, and the rest from the reading columns of the *Am. Agriculturist*, as follows:—

**EXCELSIOR! EXCELSIOR!! HONEY MADE TO ORDER. Phelps' Sectional Frame and Movable Comb Hive,** Patented Nov. 9, 1858. By means of this novel improvement the honey is taken from the hive in small frames, in separate pieces five inches square (without injury or exposure to the bees), in the most beautiful and convenient form for table or market use.

We do not give the cuts, but copy the description of them, which is as follows:—

Fig. 2 is a side view of one of the frames, A, A, taken out. Inside of this are four smaller frames, E, E, E, E, each one of which is about 5 inches square. Fig. 3 is one of the smaller frames taken out. Fig. 4 shows several smaller frames, E, E, E, E, arranged in a box to be placed in the top of the hive, when desired.

The advantage of these small frames, placed in any kind of hive, is, that the honey is deposited by the bees in small pieces of comb, say five inches square, which is a very convenient size for taking out to place upon the table, without disturbing the remainder of the comb in the least. In manipulating with bees, also, the different frames, A, A, or E, E, can be removed, replaced, or shifted, as may be desired.

From the above it will be seen that sections have been used inside of large frames, in the United States, about 25 years — long enough, at least, to become public property. M. M. BALDRIDGE.

St. Charles, Ill.

With the above came a picture, showing the little frames inside of the big ones, as plainly as any thing can be. This was patented Nov. 9, 1858. Now, if friend Flick tells us the truth at all, and he probably does in such a matter, the Patent Office granted him a patent for the same thing eleven years afterward, when it had already been illustrated in such a monthly as the *American Agriculturist*. That was the state of the Patent Office proceedings in '69, and I think there is no question but that the matter has become steadily worse ever since, for the reason that it becomes yearly more and more complicated. Patents of section honey-boxes have been thick and fast ever since the date mentioned above, and Prof. Cook, in his new Manual, mentions some of them, and probably alludes to this particular box. It would seem as though the Patent Office had a fashion of granting a patent on every section and box brought forward, and then the owners of these patents have been left to fight it out as best they could.

### SWARMING IN MAY AS FAR NORTH AS NEW YORK.

PENNSYLVANIA NOT VERY FAR AHEAD, AFTER ALL.  
SEE PAGE 330.

**T**HE swarming season opened with four swarms on the 18th inst., and some every day since.

What has got into the bees, with such a cold, backward spring, to start up and swarm the first two or three pleasant days that we have? It is only ten days since fruit-bloom opened, and it has been so cold and windy that the bees have been able to fly only a part of each day till the past three or four days. I begin to think that the bees are as full of whims and notions as the bee-keepers. Or, perhaps, it is the sometimes whimsical movements of the bees which make bee-keepers differ so much in opinion. Here I have been trying to build up my colonies on the Doolittle plan; and before I have got half way through with it, the bees take matters into their own hands, and go to swarming.

I guess Doolittle can't have any fruit-trees in his neighborhood, or he would not advise putting frames of honey in the center of the brood-nest, right along once a week till white clover. My bees, instead of emptying the last frame of honey which I gave them, have filled it full of fruit-bloom honey. Cherry-bloom has been very abundant; and from the way the bees have worked upon it, it must have yielded honey very freely. Pear and plum trees are also very full of bloom, but the bees notice them but little. A few crab-apple trees, which are just coming into bloom, are roaring with bees.

I packed 54 swarms in chaff last fall, and they

all came through in good condition except two, which had the dysentery during the winter, and were pretty well reduced.

JAS. MCNEILL.

Hudson, N. Y., May 21, 1883.

Why, friend M., you have nothing to feel bad about, even if the bees did swarm in May. I don't a bit wonder at it, if you kept giving them frames of uncapped honey right along as you say. Just keep right on doing the same thing until they can get plenty of honey from the fields, and you will come out all right. I would not think of giving bees honey in that way while they are getting plenty of stores from apple-bloom. No wonder they wouldn't take it out. Friend Doolittle's directions, if I am correct, were only intended to keep up this feed when no honey was coming in from the fields.

### FRIEND MUTH'S PICTURE.

THE MAN WHO HAS HIS APIARY ON THE TOP OF HIS HOUSE.

**F**RRIEND MUTH is one of our veterans in bee culture. Years ago, when we first began to talk about movable-frame hives and Italian bees, he was one among us, and a man always posted. Of late years he has been pretty well known by his articles on the treatment of foul brood; and as he succeeds in curing it in his own apiary, we think it fair to presume he would in any apiary, if he had proper facilities. Although for many years friend Muth's apiary was on the roof of his store, or, rather, store and dwelling, it is now situated in a sort of open veranda, the open side being next to the river. Through this open side the bees go out and in. The hives are placed a convenient distance from the floor, and arranged with alleys between them. Although he has some 30 or 40 colonies grouped together quite closely, they seem to go out and in, and find their respective hives just as well, for aught I could see, as those located in the open air. The bees we saw there last fall were beautifully marked, and very docile. On next page we give you the picture.

Friend Muth has, of late years, been more widely known as a great honey buyer, than as a producer of honey on a large scale. Perhaps no man in the world has bought and sold more honey than he has; and one very pleasant thing about it is, that in all these large business transactions all his customers seem to be warm personal friends.

While at the convention last fall, the subject of the palmetto honey of the South came up. Friend M. was called upon to tell what he knew about it. In order to impress upon us that the honey was of excellent quality, he made the remark that on one shipment which he had engaged for 8 cents a pound, he afterward paid the man 10, because it went so much beyond his expectations. At this point Prof. Cook arose and interrupted him. "Friend Muth," said he, "I wish to ask just one question right here." "Very well, go on," said our jovial friend. "I want to know," said friend Cook, "if the convention are to understand that this is the kind of a man you are." "It is the kind of a man I was *that* time," was the prompt reply. And

I really believe that that *is* the kind of a man friend M. has always been, and I trust always will be. We close our account of friend Muth by the following from the pen of our good friend Mrs. Harrison:—

FRIEND MUTH AT HOME.

As I was returning from Lexington, Ky., in the fall of 1881, where I had been to attend the National Bee Convention, I had the misfortune to be transferred to the wrong depot, thus missing my train, and had to remain in Cincinnati until Sunday evening. This misfortune turned out to be a blessing in disguise, for (having a mortal dread of being cremated in a hotel) I sought the hospitable roof of friend Muth, whose latch-string always hangs out to bee-keepers. I have been told, by those living in the vicinity, that they are always sure of a cordial welcome by the Mutts, if they go over so often.

her. Mrs. M. told me that she had had but three girls in the last twenty years, and they all stayed with her until they were married. I can plainly see the *why*. Mrs. Muth introduced me to her friend; and as they were crowded for room, I occupied one in which were two beds — one by myself, and the other for this lady friend. I imagined that the lady friend was a visitor, like myself; but on the morrow I learned that she was the "hired girl." I could see no difference in the treatment she received, from that of their own daughter, about her own age, and she worked with a heartiness and zeal that I seldom if ever saw equaled. She was serving her *friends*.

The store and home of friend Muth, with his apiary upon the roof, are patterns of industry. His business is a great one; but all the family are helpers — the wee daughter, and the grandson, Charles the third, help with their love and prattle. Mrs. M.

CHARLES F. MUTH, THE GREAT HONEY-MAN OF CINCINNATI, O.

I found friend Muth, with beaming countenance, entertaining the youngest of the family, a little girl apparently about four years old. My intrusion upon their pleasure seemed almost like sacrilege; but he assured me that I had done the "correct thing in coming to him." During this visit I saw more of German life than I had ever seen before. When I came down to breakfast, I found Mr. Muth "gone already" to assist in a "children's feast" that was held that day for the benefit of the Lutheran Orphans' Home. In the afternoon I accompanied Miss Muth to this Home, and saw Germans as they are in the far-off "vaterland." The house and grounds of the institution, and the adjacent sidewalks and streets, were literally covered with people, as thick as they could stand — acres upon acres of Germans, drinking beer, smoking, and eating; but all was good nature; no fighting nor drunkenness. Mr. M. said that they expected to make \$3000 that day, for the benefit of the orphans.

Here I learned that *one* woman in America could employ good efficient help that would remain with

told me that if I would remain until the next day I could see her "cook three barrels of honey." She had six square pails that fitted into a zinc pan with a rack in the bottom, so that they were all surrounded with water. She took off the scum, as long as any rose, and then it was poured into a tank from which it was drawn through a gate into bottles. The packages of extracted honey that I saw there were as near perfection as it is possible to be.

The bees came in and out of the store *ad libitum*; and if a bee chanced to get into the hair of the round-headed German lads, it was carefully helped out, without stinging or getting injured, and customers did not mind them. MRS. L. HARRISON.

Peoria, Ill., May, 1883.

I am very glad indeed that you noted that point in regard to the "hired girl," Mrs. H., for it is that spirit we need to solve all our troubles about "help" in our homes. I noted the same thing at friend Muth's, and who can wonder that these girls all stayed until they got married?

## The "Smilery."

FRIEND FRADENBURG EMERGES FROM BLASTED HOPES.

**C**OCK-A-DOODLE-DOO-O-O-O! Ha, ha, ha-a-a-a! Put me in the "laughery," quick, before you forget it. You have had me marching up and down the path of prosperity in apiculture for the past 6 or 7 years, and now I am looking up, up, up, and have got a broader grin on my "pbiz" than an Ethiopian ever dared to have. Here is what ails me: Last fall I put 26 stocks in chaff hives. All are good to-day; 2 or 3 dwindled somewhat, but not seriously. Then I put 11 in 1½-story hives, with chaff cushions inside, and corn fodder outside, and can state their condition with two letters — O. K. After getting those fixed I had quite a number that I had used to raise queens from. All had young queens, but they were light. What should I do with them? I made a hive about 5 ft. long, and wide enough to take an L. frame crosswise. I put in three well-filled frames of stores, natural fall honey; then the bees; then a ½-inch wood division-board; then three more frames of bees; then another division-board, giving entrances alternately from side to side.

When filled, I had in 7 3-frame nuclei. I do not think more than one or two had much if any more than a quart of bees, but they were mostly young bees. They were covered first with enameled cloth, then old cotton quilts; then a lid 5 inches deep, with an auger-hole in each end; then a rough box outside, with a 4-inch space and chaff, with auger-hole in the ends. And what is the result? To-day, May 7, I have taken out the two outside ones and put them in regular hives to give more room. Instead of the 3 frames of honey that I put in last fall, I took out 3 frames of brood, almost solid from end to end, and all are in like condition. In short, some of these are the very first ones to hang out this spring. This proves a theory that I have had ever since I have kept bees; viz., that queens may be wintered through in small clusters of bees, if we can get the conditions right.

But, just hold you breath a little. I am not done yet. After getting them fixed it was getting cold, and I had yet 2 light nuclei with fine young queens. What could I do with them? Kill one, and unite? They would then be too light to winter. Kill the other, and unite with some other stock? But what a pity to kill such nice queens! This I did: I put them in a hive on frames 1x11, with a ½-inch division-board between, with "No" sealed honey, and not more than half a pound each in the combs; cushions on top, and rough box with chaff space outside, and left them on their summer stand, "to starve and freeze." Wicked, wasn't it? and what about them to-day? They are both stronger than when packed, and are "gaining finely." But what did they live on? Why, I just raised the cover, and laid the contents of partly filled sections right over the clusters every week or 10 days; that's all.

But I have a disappointment. I went to all this trouble on purpose to save a few queens to give to queenless colonies this spring; but I can not find one queenless to give them to. Bad, isn't it?

And now I am to the end,  
And from this rostrum I'll descend

A. A. FRADENBURG.

Port Washington, O., May 7, 1883.

Well, I declare, friend F., is that really your letter? Are you the same man who wrote that "Blasted Hope" letter on page 293 of last year's GLEANINGS? I presume you remember the advice I gave you then. It now seems that you took it, and more too. It has often been said, you know, that there is but one step from the sublime to the ridiculous. In your case it seems rather to have been a step from Blasted Hopes to Smilery. It is too bad, that is a fact, that you were disappointed in regard to finding a place for those two queens. Couldn't find a queenless colony! Now, why is it that you can't do this same thing again; or, rather, why can't we all do it? Was it the result of good care, or did it just happen so?

You may put me in the Smilery. My 71 stands of bees are doing well, but I am more interested just now in our blue-eyed girl, two weeks old, than in bees.

J. W. BRADLEY.

Columbia, Mo., May 13, 1883.

I don't blame you a bit, friend B.

## FLORIDA, BY OUR OLD FRIEND WOLFENDEN.

THE UNDESIRABLE FEATURES, AS WELL AS THE DESIRABLE.

**I**HAVE sold my farm in Wisconsin, and am located at Geneva Lake, same State, for the summer, but am at present in Florida on an exploring expedition. So far I am not favorably impressed with the State as a location in which to engage in bee-keeping as a business. The mangrove is doubtless the best honey-plant in the State; but I am informed that it grows only on the low coasts where the insects are very troublesome. The few beekeepers with whom I have conversed say it is an excellent place for bees; but they keep them in the old-fashioned way, and can not tell how much honey they get, but "reckon" they get a "right smart lot."

I may locate here, if I find a suitable place in which to engage in orange-growing, in connection with bee-keeping. The former is fully as attractive as the latter, and perhaps more profitable. Groves increase in value very rapidly, and one in full bearing is valued at from one to three thousand dollars per acre. One was visited last Saturday, only an acre in extent, from which \$1500 worth of oranges was sold last winter. This, of course, is exceptional. Vegetables are raised in large quantities for the northern markets. The season is mostly past now, as they are now ripe further north. Strawberries continue in bearing several months. A friend has a quarter of an acre, from which he commenced to gather and ship fruit Feb. 1; there are still plenty of blossoms, and green and ripe fruit in abundance. I am now writing under a magnolia-tree nearly three feet in diameter, on which are many blossoms 5 or 6 inches across, and the limbs beautifully draped with Spanish moss, hanging pendant 6 to 8 ft. I paced the ground covered by a large water-oak. Its diameter was more than 100 ft.; its branches were also covered with moss — the most beautiful thing I ever saw, and worth many miles of travel to see. This country is mostly sand; mosquitoes are plentiful, and the thermometer stands at 92° in the shade.

Ocala, Fla., May 15, 1883.

J. L. WOLFENDEN.

### THE BEST BEES FOR BUSINESS.

ALSO SOMETHING ABOUT ITALIANS ON RED CLOVER,  
ETC.

**F**IVE years ago I purchased a queen from J. H. Nellis, of Canajoharie, N. Y. From the workers from this queen I obtained the first pound of white honey that I had ever produced, this being the first colony of Italians that I had ever owned, and the only ones in the whole town. My bees previous to this were blacks, as were all others owned by other parties; and when this white honey was produced by the new colony of Italian bees, and as owners of bees in the vicinity, as well as myself, had hardly ever, if at all, produced any white honey, considerable interest was manifested, and a desire for the Italians began to develop. At the time this colony was storing white honey, the blacks were slowly storing from buckwheat that had voluntarily sprung up in fields of oats that had been devoted to buckwheat the previous year.

As I was much interested in the proceedings, I began to look about to see from what source these Italians were obtaining this white honey. As there was a large field of red clover of the medium variety just across the road, opposite the apiary, in full bloom, I began to watch to see if I could see any bees working upon it. Upon making an examination I found both kinds, blacks and Italians; but the percentage of Italians, although there was only one colony in the country, while there were hundreds of blacks, was greater than that of the blacks. I came to the conclusion at once that the Italians would work out of choice upon red clover, while the blacks at such times would choose a variety, and work upon every variety of bloom that secreted honey; and my conclusions were confirmed by finding the blacks working upon every variety of bloom then in the vicinity, but taking to buckwheat more than any other bloom. I also at the same time made a close inspection, but could find no Italians working upon the buckwheat, while the blacks were visiting the white snowy blossoms in countless thousands.

As I had obtained, by close inspection, a complete knowledge of the different sources of bloom that yield honey in my locality, I summed up the case at once, and came to the conclusion that a hybrid strain of bees, and pure blacks, as well as pure Italians, could all be kept and worked with pleasing and profitable results in a location like ours, here in this portion of Schoharie County, where so many different varieties of bloom abound, such as clovers, 3 or 4 kinds, mellilot, basswood, volunteer buckwheat in the latter part of June and the first of July; while in August, thousands of acres of snowy fields of buckwheat abound in every direction.

The colony of Italians worked upon red clover, and also upon white, until the season was past for their bloom; in the mean time the blacks had kept working upon the volunteer buckwheat until it ceased to bloom, when they nearly came to a standstill. The Italians were every day busy, and slowly storing pure white honey in sections, while the blacks were gathering hardly enough to supply their brood. This kept up until the last days in July, when the blacks began to work upon a few acres of buckwheat close by that had been sown rather early, and in a few more days began with a rush, as buckwheat in general began to bloom. I now began to

slow up, and were now storing in the corners of unfinished sections of white honey a few cells of darker, or amber-colored honey, to see if they would take to the buckwheat, and do as well as the blacks; but in this I was disappointed. The blacks were working with a rush, and rapidly filling sections with buckwheat honey, while the colony of Italians were not doing much, and a large share of them were hanging idle upon the outside of their hive. This kept up for a few days, when I noticed that they began to work a little sharper, and from this time until the close of the buckwheat bloom they stored quite a little buckwheat honey, but a comparatively small amount in comparison to the blacks. I also found a difference when I removed the sections; those from the Italians were not so nicely finished as those from the blacks. The honey had a dark, watery appearance, caused by capping the cells direct upon the honey.

After giving the matter due consideration, I came to the conclusion that Italians would gather and store white honey while the blacks were doing nothing, unless they could find buckwheat; also that they would work upon red clover, and store a large lot of beautiful and delicious honey from it, while the blacks were slow to take to it, and gather but little therefrom. I also noticed that they used less propolis, and that the sections were much cleaner, and less daubed up than those upon the black stocks; and every year since has proved the above to be correct; and in a location like ours, I am fully convinced that workers bred from Italian queens mated with black drones will give just as much white honey, and in August, when buckwheat is in bloom, will give more, and much finer in appearance, than pure Italians.

I wish to say a little more in regard to the characteristics of the colony of Italians, above alluded to. While every colony of native bees that I had gave a natural swarm, this colony of Italians never attempted it. The next season was the same; and although I kept this queen until she was nearly 5 years old, they never attempted to swarm but once. I reared a good many queens from this colony, and a greater portion of the queens and bees which sprang from this colony show the same traits as did the original stock. I also had a few colonies that refused almost entirely to work upon buckwheat, as a drop of dark honey could rarely be seen in their hives. I also sold a queen from this same old colony of Italians to E. W. Haverly, of this town, and he has informed me that they would almost entirely refuse to work upon buckwheat; and that, while other stocks were storing dark or mixed honey, this colony was storing light. The result of my experience and observations for the last five years has convinced me that, in sections, where their main dependence is buckwheat, a hybrid race, from half-bloods down to nearly pure blacks, will give the best results; and in sections where there is a variety of bloom, such as clovers, sumac, etc., with an abundance of buckwheat, the apiarist will be better satisfied to keep all grades, from a part as pure as he can, some half blood, and some pure blacks; and in sections where the main dependence is white and red clover, basswood, and mellilot, then keep nothing but pure Italians, or as nearly pure as he can keep them. In view of this I shall keep my home yard all pure Italians (that will give me beautiful honey from red clover), also a yard of half-blood and lower grades, while further on, among the

extensive fields of buckwheat, a yard of pure blacks.

F. BOOMHOWER.

Gallupville, Scho. Co., N. Y., April, 1883.

We have had the same state of affairs in our own apiary; namely, Italians storing white honey from red clover, and filling sections, while hybrids brought in nothing but dark honey from buckwheat. In fact, I have noticed this so many times, as well as your remarks about more propolis from blacks or hybrids, that I have decided this one point alone to be a sufficient reason for keeping the Italians instead of the common bees. I have no doubt but this non-swarming trait you mention might be developed without much trouble, by careful selection.

### PLENTY OF ROOM.

THE SYRIO-ITALIAN—THE NEW RACE OF BEES.

**H**ERE I come, with a lot of bee talk. If you remember, Chas. Dadant used to tell us that, to be successful in the management of bees for extracted honey, we must give them room, plenty of room. Now, I think Mr. Dadant exactly right about that. The time was when I used to try to get the brood-chamber as full of bees as I possibly could before I put on the second story, containing store combs (and probably I had my bees just ready to swarm then); but it was advised by older heads, and of course it had to be done, and I used to manage my bees in a small brood-chamber (such a one as one of our Syrio-Italians would fill in the morning before breakfast). Now, in this climate, in the spring, when the queen has really got herself down to work, depositing eggs, and the hive is  $\frac{3}{4}$  full of bees and brood, I put store combs on; and I find that, if honey is coming in, by the time the brood-chamber is full of brood the bees have the store combs cleaned up, and have commenced storing. I let them fill 3 or 4 combs; then on goes another set of combs on top of the first; don't say I have made a mistake, and that the first set should have been raised up, and empty ones put under them; not much; I have tried the plan of raising the partly filled story, and putting empty combs under, but I invariably find that the bees use this middle room as a sort of loafing-place, a kind of "corner grocery" where they can talk over the subject of swarming, while those bringing in honey march right through this second set of combs, and store their honey in the top box, every time.

Now, is it not nature for them to do it? James Heddon once said, "Bees hive much easier upward than they do downward;" and about that, Mr. H. is right. I put my second set of store-combs on top of those partly filled, the heat of the hive rises to the top, warms these combs, making them soft and pliable; the bees go to work on them, and there is no stop or hitch in their work. I have had bees swarm, lots of times, when there was not one pound of honey in the lower set of combs, while the upper ones would be full. But I do not have much trouble in swarming, if I put the empty combs on top, if I put them on in time. Sometimes I neglect it, and then they swarm. I tier up sometimes as high as the third set of combs above the brood-chamber, and the Syrio-Italians find no trouble in getting to the top. This is the 20th day of April, and I have, standing right before me, Syrio-Italians working in

the 3d set of combs above the brood; but only one is doing this. The watchword of the Syrio-Italian is "onward and upward." This is my 3d year's experience with this strain of bees, and (for this climate) I consider them as much superior to the pure Italians as the pure Italians are superior to the blacks. (I have no queens to sell.)

It is very easy to see why bees swarm when in a normal condition. I think that, in 19 cases out of every 20, it is because they have not plenty of room. It is my opinion, that the queen has "nothing to say" about this swarming business; if the hive is too small to accommodate the bees, they must hunt new quarters; and as all know that, when they once get the swarming fever, 'tis hard to get that notion out of their heads, I say give them room, and before they are crowded, and give it to them in a shape that they will use it. Again, it is my opinion that this tiering-up system is the correct way to manage bees while running for extracted honey; for 'tis easy to see that, in 3 or 4 boxes, we have more bees than in one or two boxes; and the more bees we can keep together in one body, the more honey we shall get. And the great advantage of having the honey fully ripened in the hive fully pays for the extra amount of labor spent in uncapping the full comb.

A. W. OSBURN.

El Monte, California, April 20, 1883.

Friend O., I am right with you in your plan of tiering up hives of empty combs. I have tried it, and I know it is good for extracted honey, or honey in frames, and I don't know but it will work well also for honey in section boxes. I am inclined to think that your new race of bees, a cross between the Syrians or Cyprians, and Italians, are going to be grand bees for collecting large quantities of honey, especially if you give them room.

### THE HONEY-BEE.

ITS FOOD, GROWTH, AND HABITS.

**T**HE first 21 days from the time the egg is laid is spent in the cell, at the end of which a perfect worker bee emerges. While in the cell the food is bee-pap, a substance prepared by the worker bee, and placed around the larvæ. It is composed of honey, partly digested, and the saliva of the worker. The larvæ subsist entirely by osmosis; it can not eat, and food of a grosser nature would not nourish it. With reference to its food, this is its first stage — the stage of growth.

Immediately upon leaving the cell, the worker wanders over the comb in search of food. Its appetite has now been acquired. It passes over cells of uncapped larvæ containing bee-pap, leaving it untouched. It has never had a taste for this; and over cells of pollen, a taste for which it has not yet acquired. It now subsists exclusively upon honey. Here again the Ubiquitous Life Power, the living principle of the bee, that enabled it to recognize the affinity existing between itself and the young larvæ, and forces it to prepare suitable food for its development, enlightens the worker in reference to the necessary food of the infant worker, and impels it to encircle the brood-nest with uncapped honey; pollen, too, is furnished for its convenience; but honey is given the preference. The bee has now reached the age of usefulness, and the Life Principle
